Note: Key wells are the monitoring wells in the South Parcel (CHMW-1 through 4) and the closest marsh monitoring stations (EM-1 and -2), including both shallow and deep wells at those locations.

4.2.3 Notifications

Notifications are intended to alert the Environmental Caucus to the occurrence of an event. Routine reporting, including project status updates, data summaries, pumping test analyses, are described in the next section (Section 4.2.4).

CalPortland will inform the designated representative of the Environmental Caucus of each of the following types of events:

1) At the start of each dewatering step;

2) Major milestones within each step (such as addition of new pumping wells);

3) Upon collection of monitoring data indicating actual groundwater levels are lower than the performance thresholds; and

4) Implementation of response actions.

The Environmental Caucus will provide timely notice of any changes in its attorney, consultant, or designated representative or their contact information.

Notification points in each of the dewatering steps are summarized in Table 2, except for routine reporting milestones (which are summarized in Table 3). Notifications will be provided in writing by email, letter, or memorandum/report, as appropriate for the nature of the notification. It is anticipated that most notifications will be provided by email.

Groundwater monitoring data (including raw data) would be provided within 2 days of any notification that monitoring results are below performance thresholds.

Table 2. Summary of Notifications by Dewatering Step

Dewatering Step	Events Triggering Notification of Environmental Caucus	Timeline for Notification
Step 1 – Initial Pumping Test	Updates to pumping test plan	Within 3 days of updating plan
	Installation of pumping test wells	1 week prior to start of drilling
	Start of pumping test	1 week prior to start of pumping
	Monitoring results below performance thresholds	Within 24 hours of measurement
	Any adjustments implemented during pumping test	Within 24 hours of change
	End of pumping test	Within 24 hours
Step 2 – Preparation for Mining/ Dewatering Test	Updates to dewatering plan based on Step 1 results	Within 3 days of updating plan
	Installation of Step 2 dewatering wells	1 week prior to start of drilling
	Start of dewatering	1 week prior to start of pumping
	Monitoring results below performance thresholds	Within 48 hours of measurement
	Any adjustments implemented during dewatering	Within 24 hours of change
Step 3 – Active Dewatering during Mining	Commencement of mining in the South Parcel	1 month prior to start of mining
	Initiation of pumping at new wells	1 week prior to start of pumping
	Monitoring results below performance thresholds	Within 3 days of measurement
	Any adjustments implemented during dewatering	Within 3 days of change
	Cessation of active dewatering	Within 1 week of ceasing dewatering
Step 4 – Cessation of Active Dewatering	Monitoring results below predicted values	Within 3 days of measurement
	Completion of mining in South Parcel	Within 1 month of completion

The timeline for notification that monitoring results are below performance thresholds increases from 24 hours in Step 1 to 48 hours in Step 2 to 3 days in Steps 3 and 4 for four reasons:

1) the rate of change in groundwater levels will slow as mining progresses;

2) confidence increases over time as the number of wells pumping and set of successful groundwater measurements grows (mining and dewatering only advance when performance thresholds are met; see Section 4.2.5 for the specific limitations);

3) new wells begin pumping substantially in advance of mining both in time and space and dewatering proceeds from farthest away towards the creek and

marshes, which allows for the marginal impact of adding new wells to be reversible, even in during Step 3; and

4) Gravel would continue to be mined, but the volume that could be mined during the notification period is nominal compared with the volume of each mine segment, which are expected to require 1.5 to 2 years of mining to complete.

4.2.4 Routine Reporting

CalPortland will routinely share information about mining, dewatering, and the adaptive management process with the Environmental Caucus to achieve a variety of purposes, including sharing and interpreting monitoring data, documenting actions taken during a dewatering step, providing updated model predictions and analysis, and response actions, if necessary.

The specific reports required during each step of dewatering are summarized in Table 3. Additional detail about the individual reports and their role in the adaptive management process is presented in the Detailed Adaptive Management Plan in Section 4.3.

Table 3. Summary of Reporting by Dewatering Step

Dewatering Step	Reports	Minimum Frequency of Reporting
Step 1 – Initial Pumping Test	Pumping Test Design	One time
	Pumping Test Progress	Weekly during test
	Pumping Test Results	One time
Step 2 – Preparation for Mining/ Dewatering Test	Dewatering Plan for Step 2, if revised.	One time
	Pumping Test Progress	Weekly for first 2 months
	Pumping Test Results	One time – 4 months after start of Step 2
	Dewatering Summary Memos	Monthly
Step 3 – Active Dewatering during Mining	Dewatering Plan, Mining Plan, or SAP, if revised.	One time
	Dewatering Summary Memos,	Monthly for 3 months after each new set of dewatering wells, then quarterly
Step 4 – Cessation of Active Dewatering	Dewatering Summary Memos for first year	Quarterly for 2 years, then annually

The purpose and contents of each report are outlined below:

- Pumping Test Design/Dewatering Plans will provide the plan for performing the pumping tests and/or dewatering. These plans will include the proposed well pumping and observation well locations, depths, well construction, drilling methods, data collection, and timelines.

- Pumping Test Progress will provide a status update during the pumping test including an overview of progress toward completing the test, identifying which wells are pumping and pumping rates, locations and frequency of monitoring, any changes to the pumping test plan, and notes on how the test is proceeding.

- Pumping Test Results will present a detailed reporting of the execution of the pumping test, a summary of the data collected, including figures showing groundwater levels and pumping rates over time, comparisons of groundwater levels with performance thresholds, data analysis and results (estimates of key hydrogeologic parameters), and a comparison between model predictions and pumping test results for the purpose of model evaluation and validation.

- Dewatering Summary Memos will provide a summary of mining and dewatering progress, including information on any new wells installed, initiation of pumping at new wells, overview of wells that are pumping and pumping rates, cessation of pumping at wells, areas of active mining, and reclamation activities.

Reports will be prepared by a third-party consultant to be selected and paid for by CalPortland. The reports will be distributed to the Environmental Caucus electronically in protected documents, with hard copies available on request. Raw monitoring data will be provided with any groundwater measurement below a performance threshold, or when requested by the Environmental Caucus.

4.2.5 Limitations on Mining

In order to establish bounds on the pace and advancement of mining that will allow time for the adaptive management process to succeed, CalPortland commits to the following limitations on mining and dewatering activities in the South Parcel:

1) Mining associated with active dewatering (i.e., mining of the trough along the eastern boundary of the South Parcel; Figure 3) will last at least 3 years.

2) The mine trough has been divided into four segments (1A to 1D; Figure 3). Mining of each segment will last at least 9 months.

3) Mining will not advance into the next segment, unless groundwater levels meet performance thresholds.

4) Dewatering activity will not intensify through commencing pumping at new wells or increasing pumping rates at existing wells (except for normal seasonal changes in pumping rates), unless groundwater levels meet performance thresholds.

These limitations do not apply to operations of the existing mine and processing area, or extraction of gravel from areas west of the Olympia Bed truncation within the existing mine or North Parcel as these areas do not require dewatering.

4.2.6 Meet and Confer Process

Section 7.3 of the Settlement Agreement states that the Monitoring Plan will include a "process for the Parties to meet and confer if the groundwater levels do not meet the criteria provided in the Monitoring Plan." The process described below involves two steps for the parties (CalPortland and the Environmental Caucus) to follow with respect to groundwater information and data obtained during the monitoring process. The first step is for the parties' technical consultants to engage in one or more technical review conferences. If necessary, the second step would involve one or more meetings between the parties' designated representatives to discuss any differences of opinion or interpretation that the technical consultants are unable to resolve. Each of these two steps is discussed further below. This two-step process may be invoked at any time, including but not limited to the various specific points in the adaptive management process identified in Section 4.3 below.

Technical Review Conferences. The Environmental Caucus may initiate a request for a technical review conference of the parties' technical consultants at any time to discuss any questions or concerns it might have about any aspect of the groundwater monitoring data. The conferences may be in person or via conference call or other communications technology, and there may be multiple conferences to discuss any issues identified by the Environmental Caucus. The technical consultants would work in good faith during these review conferences to resolve any differences in interpretation of the groundwater monitoring data.

Party Representative Discussions. If the good-faith efforts of the technical consultants are unable to resolve any differences of opinion regarding the interpretation of the groundwater data, including but not limited to what the data shows regarding groundwater levels, either CalPortland or the Environmental Caucus may request a meeting of the parties' designated representatives or principals by providing notice to the other party of the desire to meet, and a brief explanation of the reasons for the request.

Once noticed is provided, CalPortland and the Environmental Caucus would work collaboratively to agree on a meeting format, date, time, and place to be held within 30 days of the request to hold a Technical Review Conference or a Party Representative Discussion. Meetings may be in person or via conference call or other communications technology, and there may be multiple meetings. This paragraph is intended to generally describe, but not constrain, the ways that the parties may choose to meet. Based on the issue raised, CalPortland would prepare and provide appropriate information summarizing the issue and current status of mining and dewatering activities, sharing related monitoring data (including raw data, if requested), and identifying potential responses.

Representatives of CalPortland and the Environmental Caucus will confer during the meeting on the most appropriate response with the goal of reaching consensus. If consensus cannot be reached, the parties would enter mediation, making good-faith efforts to hold a meeting with a mutually agreed-upon mediator within 45 days of the initiation of any request to the other party for mediation.

4.3 Detailed Adaptive Management Plan

This section is the core of the Monitoring Plan. It walks through each step of the dewatering plan providing conceptual details about how the stages of adaptive management would apply to that step. Specifically, this section establishes the objectives, provides an overview of monitoring activities, outlines an approximate schedule, summarizes the approach for data evaluation, and provides initial identification of potential response actions for each step of the dewatering plan.

Specific details of the monitoring activities (e.g., monitoring locations, frequency, and methods) are provided in the SAP in Appendix B.

Although the stages of adaptive management are presented sequentially in each step, it is important to recognize that the adaptive management process will be implemented iteratively within the step, particularly for Steps 2 and 3. For example, evaluation will be conducted each time monitoring data is collected, and that evaluation could trigger adjustment and looping back through the process during the same dewatering step. Alternately, if the monitoring data consistently indicate that performance thresholds are being met, the adaptive management process for a step could be completed without requiring iteration or adjustments.

4.3.1 Step 1 – Initial Pumping Test

Step 1 is envisioned as a 10-well pumping test, conducted for a minimum of 60 days, to validate model predictions of dewatering effectiveness in the local vicinity of the test wells, and make any necessary changes to the model parameters and/or to plans for subsequent dewatering and mining activities. No mining will occur in the South Parcel during Step 1.

The adaptive management process in Step 1 is illustrated on Figure 9.

A. Assess

The assessment stage for Step 1 will include compilation of existing monitoring data, geologic information, results from prior pumping tests conducted by CH2M Hill (2000), and the latest groundwater modeling simulations of the Step 1 pumping test. Monitoring data will continue to be collected and will be incorporated into the assessment for the pumping test.

Two initial objectives have been identified for the Step 1 pumping test:

1) Evaluate model predictions near the test wells.

2) Test dewatering design for meeting mining needs (i.e., achieving necessary drawdown), collecting information to refine the dewatering design, such as the number, screening, and spacing of wells.

B. Design

Based on the information collected during the assessment phase, CalPortland, and its consultants, will prepare a detailed plan for the pumping test. The plan will identify the number and location of pumping and observation wells, well drilling and construction, pumping rates, duration, monitoring locations, equipment, and frequency, etc.

The pumping test plan will be provided to the Environmental Caucus.

C. Implement and Monitor

CalPortland will install the pumping wells and any new observation wells, and conduct the pumping test. The minimum duration of pumping during the test will be 60 days.

Monitoring would consist of two components: 1) high-frequency automated monitoring at wells that are expected to be affected by the pumping test and at sensitive receptors, and 2) continuation of routine manual monitoring at other groundwater and surface water locations.

High-frequency monitoring using pressure transducers would be performed in observation wells near the pumping test location (CHMW-2D, -2S, and MW-D-3), and at wells located nearest to Sequalitchew Creek and West Edmond Marsh (CHMW-3S &-3D and MW-EM-1D). Typically, the frequency of data collection is programmed to vary throughout a pumping test with rapid data collection at the start tapering to less frequent as groundwater levels near stabilization.

Routine monitoring would continue to occur at the normal monitoring locations, including wetland, stream, and groundwater locations outside the area of influence of the pumping test. The streamflow monitoring stations are continuously recording. Manual measurements will be used at the wetland and groundwater locations not near the pumping test.

The Environmental Caucus will be notified of the installation of wells and the start and end of the pumping test. CalPortland will also provide weekly summaries of pumping test progress, and notification (within 24 hours) of any monitoring results below the performance thresholds. Routine reporting is summarized in Table 3 and notifications are outlined in Table 2.

D. Evaluate

Data will be screened as they are collected to determine if immediate action is required. In such an event, the Environmental Caucus would be notified within 24 hours, and the project would move immediately to the adjustment stage.

As monitoring data are collected, they also will be evaluated to see if the test is well-designed and the monitoring network is effective. If necessary, the project may enter the adjustment step to improve the pumping test to collect better information.

Once representative monitoring results are being collected, they will be screened against performance thresholds in Table 4 for the appropriate well and month. The performance thresholds were established at the lower 95th-percentile confidence interval for the predicted water levels [see Section 3.3 and the Groundwater Model Update (Aspect, 2017)]. The frequency of screening will vary during the test beginning with hourly at the start and reducing to daily then weekly as the test progresses, as outlined in Table 1.

If the monitoring results indicate that groundwater levels near the marshes are lower than the performance thresholds, CalPortland would develop and implement appropriate adjustments during the pumping test.

If monitoring results indicate groundwater levels are lower than the performance thresholds in wells that are not near the marshes or other sensitive receptors (i.e., monitoring wells on the South Parcel), then the test would be completed as planned. These results would be evaluated and any anticipated adjustments for future steps identified.

Even if the observations made during the test are above the performance thresholds, they still may provide valuable information for refining the model, mine plan, and Monitoring Plan. Those observations will be considered during assessment and design for Step 2.

The evaluation will also include comparison of climate and water level conditions prior to the test with the range of conditions experienced during the model calibration and validation period.

E. Adjust

Adjustments during the pumping test could occur for two reasons:

1) The monitoring data indicate that data collected are not sufficient to achieve the objectives of the test; or

2) The monitoring data indicate that groundwater levels are below the performance thresholds.

Potential adjustments consist of modifying or terminating the pumping test, and are listed in Table 5. Since no mining below the pre-project groundwater elevation would occur during this dewatering step, any change in groundwater could be reversed by turning the dewatering wells off.

Table 5. Potential Response Actions during Step 1 – Initial Pumping Test

Modify pumping test:
Changing pumping rates
Changing the number of pumping wells
Changing the duration of pumping
Changing monitoring locations including installing new wells
Performing additional testing
Cease pumping test.

CalPortland will notify the Environmental Caucus of any adjustments to the pumping test within 24 hours of the change.

Reporting and Discussion

At the conclusion of the Step 1 pumping test, whether completed as planned, adjusted, or terminated, CalPortland will prepare an interpretative report documenting the pumping test, summarizing the monitoring data, comparing monitoring results with prior model predictions, and making recommendations for the assessment and design phases of the next step.

The report will be provided to the Environmental Caucus, with a 3-month period for review and discussion of the results. CalPortland commits to meeting with the Caucus as often as necessary during the review period to facilitate open communications and timely review. Should the Environmental Caucus and CalPortland have different interpretations

of the dewatering test results, either party may request technical review conferences of the parties' technical consultants, followed by, if necessary, meetings of the parties' representatives, as described in Section 4.2.6 above.

Anticipated Schedule
The schedule for Step 1, in the context of the overall mining schedule, is illustrated in Figure 8. It is expected to require about a year to complete Step 1, with the following anticipated schedule:

- Planning the Pumping Test 1 month
- Installing and Developing Wells 2–3 months
- Performing the Pumping Test 2 months
- Evaluating Results and Reporting 2 months
- Model Updates (if necessary) 2–3 months
- Review by and discussion with Environmental Caucus 3 months

Incorporation of the results into the design of future steps could require additional time.

4.3.2 Step 2 – Preparation for Mining/ Dewatering Test

In Step 2, additional dewatering wells will be installed and will be pumped for several months to draw down groundwater until the gravel in the first mine segment of the South Parcel is dry enough to mine. If monitoring results are above performance thresholds during Step 2, the intent is to continue dewatering from those wells and transition smoothly into Step 3 – Active Dewatering during Mining. Step 3 would only commence when groundwater levels are above the performance thresholds.

The dewatering activity will also serve as a greatly expanded pumping test, the effects of which are completely reversible. The information collected in the first 60 days is most valuable as a pumping test, so evaluation and reporting on the test will focus on this period. The pumping test portion of Step 2 will occur for a minimum of 60 days.

The adaptive management plan for Step 2 is illustrated on Figure 10.

A. Assess
The planning for Step 2 will incorporate the results of Step 1, including any updates to the groundwater model, this Monitoring Plan, or mine plan resulting from Step 1.

In the assessment phase for Step 2, the results of the pumping test in Step 1 will be compared with the groundwater model. If they agree, then design would move forward as planned. If there are notable differences, the groundwater model would be evaluated and potentially modified.

The first level of model evaluation and modification would consist of updating the model to reflect the specific conditions of the Step 1 test (well locations, well construction, pumping rates, antecedent weather conditions, etc.) and developing a set of model predictions specific to the actual test conditions. These updates only modify the scenario for Step 1 and would not require recalibration of the model.

If the predictions from the updated model are notably inconsistent with the results of the pumping test, then the model parameters would be modified and calibrated to the observed data. Then, the full suite of predictive scenarios would be evaluated and compared with the groundwater levels included in the environmental analyses and permitting. If within the contemplated range, the project would move forward to the design phase with the revised model. If not, additional environmental analysis may be necessary.

The initially identified objectives for Step 2 are:

1) Evaluate whether groundwater levels at monitoring wells are above the performance thresholds; and,

2) Confirm that groundwater levels are low enough within the material to be mined to allow for safe and efficient mining and processing.

B. Design

Based on the results of the assessment step, the dewatering plan for Step 2 and the associated monitoring will be designed by CalPortland. Updates to the design will be simulated with the groundwater model and compared with prior environmental analyses as described above. If the model was updated in Step 1 or the assessment stage of Step 2, the predictive results from the updated model will be used to establish new performance thresholds.

Updates to the design and predictions of its impacts on groundwater will be provided to the Environmental Caucus.

C. Implement and Monitor

The additional dewatering wells for Step 2 will be installed and begin pumping. Pumped water will be discharged to an infiltration facility on the floor of existing mine. Pumping will occur for a minimum of 60 days to complete the dewatering test plus an estimated four additional months to dry gravels in Segment 1A sufficiently for mining.

Monitoring would consist of weekly monitoring at the key wells on the South Parcel in the portions of Edmond Marsh closest to the mine (key wells are defined in Table 1) and twice monthly monitoring at the other well, staff gage, and flow monitoring stations. Stations with continuously recording instrumentation, such as the flow monitoring stations, will be downloaded during these visits. Pressure transducers would also be installed to allow for continuous monitoring in key monitoring wells. Manual measurements will be collected from the other locations, such as staff gages and more distant wells.

The Environmental Caucus will be notified of the installation of wells and the start of dewatering. CalPortland will also provide weekly summaries of dewatering progress during the first two months, then monthly summaries. CalPortland will notify the Environmental Caucus (within 24 hours) of any monitoring results below the performance thresholds. Routine reporting is summarized in Table 3 and notifications are outlined in Table 2.

D. Evaluate

The evaluation stage in Step 2 is very similar to the evaluation stage of Step 1, as both actions are essentially pumping tests at different spatial scales.

Data will be screened as they are collected to determine if immediate action is required. In such an event, the Environmental Caucus would be notified and the project would move immediately to the adjustment stage.

Monitoring results will be screened against the performance thresholds in Table 6 for the appropriate well and month. The performance thresholds were established at the lower 95th-percentile confidence interval for the predicted water levels [see Section 3.3 and the Groundwater Model Update (Aspect, 2017)]. If the monitoring results indicate that groundwater levels are lower than the performance thresholds, CalPortland will develop and implement appropriate adjustments.

Even if the groundwater levels are above the performance thresholds, they still may provide valuable information for refining the model, mine plan, and/or this Monitoring Plan. Those observations will be considered during assessment and design for the next dewatering step.

The evaluation will also consider the effect of conditions occurring at the time of monitoring (such as climate conditions, development, and Restoration Plan activities) with the range of conditions experienced during the model calibration and validation period, and include that information in the interpretation of results.

E. Adjust

Adjustment during the pumping test could occur for two reasons:

1) The monitoring data indicate that dewatering could cause groundwater drawdown beyond that previously contemplated and permitted; or

2) The monitoring data indicate that groundwater levels are not sufficiently low within the mine to allow for safe and efficient mining and processing in Step 3.

The first case would trigger rapid development and implementation of adjustments by CalPortland. If adjustments are not feasible or are exhausted without success, CalPortland would request to initiate the technical review conference of the parties' technical consultants, followed by, if necessary, meetings of the parties' representatives, as described in Section 4.2.6. The Environmental Caucus may also initiate this process.

In the second case, CalPortland would refine the dewatering plan while pumping continues. Potential adjustments include modifying or terminating the pumping test, and are listed in additional detail in Table 7. The list of adjustments provided in Table 7 is not intended to limit the range of potential responses.

CalPortland will notify the Environmental Caucus of any adjustments within 24 hours of the change.

Step 2 is completely reversible as no mining below the pre-project groundwater elevation would occur. Any change in groundwater could be reversed by ceasing to pump from the dewatering wells.

Table 7. Potential Response Actions during Step 2 – Preparation for Mining/Dewatering Test

Revise monitoring (change frequency of monitoring, or monitoring locations).
Install additional monitoring locations.
Change pumping rates.
Change pumping locations (adding or decommissioning) wells.
Modify the duration of pumping.
Cease dewatering.

Reporting and Discussion

In addition to the dewatering summaries described above, an interpretative report will be prepared in the third month of pumping for Step 2. The report will summarize the pumping-test portion of Step 2 by summarizing the first 2 months of data, comparing monitoring results with prior model predictions, documenting any response actions taken, and making recommendations for the assessment and design phases of the next step.

The report will be provided to the Environmental Caucus, with a 2-month period for review and discussion of the results. CalPortland commits to making its technical consultant available to meet with the Caucus's technical consultant as often as necessary during the review period to facilitate open communications and timely review. Should the parties' technical consultants be unable to resolve any difference in opinion in interpreting the dewatering test results, either party may request a meeting of the parties' designated representatives, as described in Section 4.2.6 above.

Anticipated Schedule

Step 2 is expected to require a about a year to complete, though the planning and well installation stages may overlap with the later reporting and discussions related to Step 1. The schedule for Step 2 and relationship with the Step 1 pumping test are shown on Figure 8. The anticipated schedule for key elements of Step 2, assuming performance thresholds are met, is:

Planning the Dewatering	2 months	
Installing and Developing Wells	2–3 months	
Performing the Pumping Test	2 months	
Evaluating Results and Reporting	2 month	Simultaneously: Continue Dewatering in Preparation for Mining
Update Model (if necessary)	1 month	
Review by and discussion with EC	2 months	4 months

If groundwater levels meet performance thresholds, Step 2 would flow into Step 3 and the start of mining. Otherwise, Step 2 may require a longer period to perform the

necessary adjustments to achieve sufficient dewatering for mining while maintaining groundwater levels consistent with the performance thresholds and prior environmental analyses, or update the environmental analyses, if necessary.

Step 3 would only commence when groundwater levels are above the performance thresholds and water levels are at appropriately low levels for safe and efficient mining and processing.

4.3.3 Step 3 – Active Dewatering during Mining

During Step 3, mining will begin in the northeastern portion of the South Parcel and proceed south to mine a trough along the eastern boundary. Additional dewatering wells will be installed and pumped to dewater gravel in subsequent mine segments in the South Parcel. CalPortland would not start pumping additional dewatering wells until groundwater levels are at or above performance thresholds.

As mining is completed, reclamation of the eastern mined slope will begin. Pumping wells adjacent to mine segments that are under reclamation will be turned off incrementally to allow natural springs to form at the toe of the mined slope and vegetation to become established.

Steps 3 and 4 are different from the first two steps in that changes to groundwater in these steps are not as easily reversed. As such, the adaptive management plan is focused on identifying when adjustments are necessary.

The adaptive management plan for Step 3 is iterative, and activities would loop continuously through the adaptive management stages throughout implementation of Step 3. The adaptive management plan for Step 3 is illustrated on Figure 11.

A. Assess

The planning for Step 3 will begin prior to the completion of Step 2 to allow for a potentially smooth transition, if performance thresholds are being met. The planning stage will incorporate previously collected monitoring data as well as any updates to the groundwater model, monitoring plan, or dewatering and mining plans.

If monitoring data from prior steps meet the performance thresholds, the planning for Step 3 is expected to move forward in accordance with the mine plan.

Differences between monitoring results and predictions would result in re-evaluation of the groundwater model. The re-evaluation would first simulate the specific conditions of Step 2, then more broadly update the model if predictions still do not match observations. If significant model updates are required, the full suite of scenarios would be simulated and results compared with the prior environmental analyses and permitting. Only if model results are within the predicted range may the project move forward to the design phase with the revised model.

The initially identified objectives for Step 3 are:

1) Evaluate whether groundwater levels at monitoring wells are above the performance thresholds for the appropriate month; and

2) Confirm that groundwater levels are low enough within the material to be mined to allow for safe and efficient mining and processing.

B. Design

Based on the results of the prior steps and assessment for Step 3, the dewatering plan, mining plan, and the associated monitoring will be updated by CalPortland, if necessary. Updates to the design will be simulated with the groundwater model and compared with the performance thresholds. Updated documents will be provided to the Environmental Caucus.

C. Implement and Monitor

Mining will begin at the northern edge of the South Parcel in the area dewatered in Step 2. As mining progresses, additional dewatering wells will be installed to the south of the current wells and begin pumping. As mining is completed in an area, the nearby wells will be turned off, allowing groundwater to emerge from springs from the toe of the completed slope. Both pumped groundwater and spring flow will be conveyed to an infiltration pond installed on the floor of the existing mine.

Monitoring would continue at all normal well, wetland, and streamflow monitoring stations. Streamflow and select well monitoring stations would have continuous recording instruments installed. Other locations would use manual measurements.

The frequency of monitoring would vary during Step 3. In the 3 months after the start of pumping for each new group of monitoring wells, monitoring would be weekly at key wells (defined in Table 1) and twice monthly monitoring at the other well, staff gage, and flow monitoring stations. After that, monitoring will be performed monthly.

D. Evaluate

As with prior steps, monitoring results will be screened against performance thresholds for Step 3 (Table 8) for the appropriate well and month. The performance thresholds were established at the lower 95th-percentile confidence interval for the predicted water levels [see Section 3.3 and the Groundwater Model Update (Aspect, 2017)]. If the model was previously updated, performance thresholds based on predictive results from the updated model will be used for the comparison. The evaluation will also consider the effect of conditions occurring at the time of monitoring (such as climate conditions, development, and Restoration Plan activities) with the range of conditions experienced during the baseline period.

If the monitoring results indicate that groundwater levels are lower than the performance thresholds, CalPortland would evaluate and implement appropriate adjustments.

Although the primary focus is on changes in groundwater levels, streamflow and surface water monitoring results will also be reviewed. By this point in the project, streamflow and surface water monitoring results will be affected by Restoration Plan activities, which are likely to have a larger effect than mining on the surface water bodies. The Restoration Plan will incorporate its own adaptive management process.

E. Adjust

Step 3 involves mining below the current aquifer level. As such, it is more difficult to reverse than prior steps; however, mining is designed to begin away from the marshes

and Sequalitchew Creek and proceed southward toward them over a period of years. This will slowly change water levels beneath the marshes and creek and allow time for response actions should the monitoring data and evaluations indicate they are necessary.

If groundwater levels are below the performance thresholds, CalPortland would develop and implement adjustments. Unlike in the prior steps, re-examination of the groundwater model is not a first element of evaluating potential response actions in Step 3.

Either party may initiate a request for a technical review conference and, if necessary, meetings of the parties' representatives, as described under Section 4.2.6 above. If adjustments are not feasible or are exhausted without meeting performance thresholds, CalPortland would initiate the process to discuss alternative approaches and next steps.

Selection of potential response actions is shown in Table 9. The suite of appropriate response actions will change over time as mining progresses. For example, early in Step 3 there is more flexibility to alter the mine plan. As mining progresses further south, the ability for alterations to the mine plan to produce a meaningful change in groundwater levels is reduced.

Table 9. Potential Response Actions during Step 3 – Active Dewatering during Mining

Revise mine phasing to allow time for additional monitoring, analyses, testing, and planning.
Revise dewatering plan (number of wells, spacing, alignment, pumping duration).
Revise mining plan to change depth or extent of mining.
Install partial slurry cutoff wall.
Provide additional mitigation.
Cease dewatering and mining.

Reporting and Discussion

During Step 3, CalPortland will prepare summary memos providing comparison of observed groundwater levels over the past 3 months with model predictions, as well as an update on dewatering and mining status, and any response actions taken. The summary memos will be prepared monthly for 3 months after each new set of dewatering wells begins pumping, then quarterly. The memos will be provided to the Environmental Caucus.

Anticipated Schedule

Mining would proceed south over a period of years. Completion of Step 3 is expected to take 4 to 8 years. The mining schedule is, in part, driven by the market demand for aggregate. CalPortland has committed to complete Step 3 in no less than 3 years, or a minimum of 9 months per each of the first four segments (1A to 1D). The minimum timeline for completion of Step 3 is illustrated in Figure 8.

4.3.4 Step 4 – Cessation of Active Dewatering

This final step of dewatering commences once mining and reclamation advances to the point that the last dewatering wells installed in Step 3 have been turned off. At that point, groundwater will emerge from springs along the length of the toe of the mined (and reclaimed) slope along the eastern and a portion of the southern mine boundaries. Step 3 is expected to transition smoothly into Step 4, given the multiple-year duration of Step 3 and that ceasing to pump the dewatering wells will result in lower environmental impact.

Several steps of the adaptive management process (i.e., assess and design) are not as relevant in Step 4, because it is a largely passive step with respect to the effects on groundwater levels. Mining and reclamation activities will continue within the South Parcel, but those activities would no longer influence groundwater levels.

As such, this discussion focuses on ongoing monitoring, data evaluation, and potential response actions. The adaptive management plan for Step 4 is illustrated on Figure 12.

C. Monitoring

Monthly monitoring would continue for the duration of mining at the normal well, wetland, and streamflow monitoring stations. Continuous instrumentation will be maintained at streamflow monitoring stations. Staff gage and well monitoring locations will be manually measured.

D. Evaluate

Monitoring results would continue to be screened relative to the performance thresholds shown in Table 10, or as refined from the most recent groundwater model. The performance thresholds were established at the lower 95th-percentile confidence interval for the predicted water levels [see Section 3.3 and the Groundwater Model Update (Aspect, 2017)]. It is unlikely that events will result in short-term changes in groundwater levels in Step 4. Therefore, the evaluation will focus on longer-term comparisons with model predictions and observations of changes in the marshes and Sequalitchew Creek.

E. Adjust

If groundwater levels persist lower than the performance thresholds, CalPortland and the Environmental Caucus would hold one or more technical review conferences of the parties' technical consultants and, if necessary, meetings of the parties' representatives (as described in Section 4.2.6). to discuss and select appropriate adjustments. Either party may initiate this process.

Reporting

Quarterly summary memos will be prepared for the first year after cessation of dewatering. Annual reports will be prepared for the remaining duration of mining of the South Parcel.

Anticipated Schedule

Step 4 will begin after active dewatering ceases. Depending on market demand for aggregate products, mining of the remainder of the South Parcel is expected to occur over 5 to 8 years after cessation of active dewatering. Active adaptive management during Step 4 would cease when the following conditions are met:

- Mining of the South Parcel is complete, and

- Measured groundwater levels have been met performance thresholds for at least 3 consecutive years.

5 Relationship of Adaptive Management Process to Sequalitchew Creek Restoration Plan

Mining of the South Parcel and the restoration of Sequalitchew Creek are separate, but interacting, projects. Each project has its own adaptive management process tailored to achieving the goals and objectives of that project. The interaction between the two adaptive management processes is three-fold: 1) project schedules that encourage restoration in advance of the potential impacts from mining; 2) development of performance thresholds for mining that support restoration based on prior technical studies, including the cumulative effects analysis prepared in 2016 (Aspect and Anchor, 2016); and 3) coordinated monitoring and open sharing of information.

Project Schedules. The mining and restoration projects have been designed to facilitate restoration occurring in advance of the potential impacts from mining. This relationship between the project schedules is founded in key elements of the settlement agreement:

1) The mining project cannot begin until all permits for restoration have been obtained and the required authorizations or approvals from JBLM needed to implement the restoration elements on JBLM have been obtained.

2) The first actions of the mining project are pumping and dewatering tests (i.e., Steps 1 and 2) and are expected to take about 1.5 to 2 years to complete and no less than 9 months[1], as described in Section 4.2.1. The effects of Steps 1 and 2 on groundwater are completely reversible.

3) The first South Parcel mining segment is located furthest from the wetlands and Sequalitchew Creek. Mining and dewatering proceed slowly toward the Creek over a period of not less than 3 years, and more likely 4 to 8 years.

4) There are no schedule constraints or limits imposed on the pace of restoration activities.

The Restoration Plan schedule is anticipated to begin with the elements that immediately restore flow through the system—specifically, beaver management and improvements at the outlet of Sequalitchew Lake. The actions will be followed by improvements that enhance flows (e.g., connections from Hamer Marsh) and make it easier to maintain flows (e.g., installation of the Railroad Trail bridge and sealing\restoration of the losing reach). Finally, habitat restoration, through culvert replacements and enhancement of wetland and stream habitats, is the final component of the Restoration Plan.

Although a detailed schedule has not been developed for implementation of the Restoration Plan, it is anticipated restoration activities will begin immediately shortly after Restoration Plan permits are obtained and it should require no more than 6 years to complete construction and implementation of all elements of the Restoration Plan. The

[1] Minimum durations for the pumping test and review and discussion stages of Steps 1 and 2 are established in Section 4.3. The specified timeframes add up to a minimum duration of 9 months, however this duration is unrealistically short as it does not include time for other key steps, like well installation or report writing.

flow restoration actions should be completed within two years from the start of the project, and followed by flow maintenance and enhancement, which may require 3 years to complete, but could overlap with the flow restoration actions. Finally, construction of habitat restoration improvements could be completed within 3 years and could overlap or dovetail with the related flow maintenance and enhancement elements.

A timeline relating the anticipated schedules for restoration and mining is presented on Figure 13. Restoration activities should be successful in restoring flows to Sequalitchew Creek within the first 2 years. During this time, the mining project would complete the second pumping test (Step 2) and, if groundwater levels meet performance thresholds and mining progresses at the fastest allowable pace, mine Segment 1A and advance into Segment 1B. The anticipated increase in flow is much greater than the potential impact from the mining project, and the full benefit in flow quantity may be achieved in these first 2 years; whereas the impact from mining is minimal at first and increases slowly over time. The impact from mining is expected to peak during mining of Segment 1C, when the greatest number of wells are pumping[2].

Even if mining is proceeding rapidly, CalPortland has committed that mining of Segment 1 would not be completed in less than 3 years, with each segment lasting at least 9 months. At this pace, the peak impact from mining could be expected around 2 to 3 years after the start of restoration. Even if delayed, the flow restoration action should have occurred by this time and only a fraction of flow restoration is necessary to offset the impacts from mining.

Performance Thresholds that are Supportive of Restoration. The cumulative effects analysis (Aspect and Anchor, 2016) found that the changes in the marshes would be dominated by the Restoration Project (which requires lowering marsh water levels to achieve flow from Sequalitchew Lake to the ravine), rather than increased infiltration resulting from lower groundwater levels. The marshes would have significantly more water flowing through them than under current conditions, resulting in consistent water levels year-round at the target levels established in the Restoration Plan, except for some periods in the driest years.

The cumulative effects analysis also concluded that the predominant cumulative effect on Sequalitchew Creek would be an increase in annual average flows by approximately 10 cfs, with abundant year-round flow most of the time. By comparison, the stream flow reductions from mining is expected to be less than 1 cfs, and only apparent during limited periods in atypical summers.

The anticipated benefits to streamflow from restoration are much larger than the potential impacts from mining. As a result, the success of the restoration project is not expected to be particularly sensitive to the groundwater levels resulting from mining. Monitoring during mining will ensure that groundwater levels remain within the expected range that will support the anticipated increases in stream flow from the restoration project. If

[2] To be conservative, the potential impacts of mining described in the cumulative effects analysis (Aspect and Anchor, 2016) were based on all wells pumping at the same time. In practice, this condition is unlikely to occur as initial wells would be phased off as mining progresses.

groundwater levels are not maintained within the expected range, corrective actions will be implemented in accordance with the adaptive management plan for mining.

Coordinated Monitoring and Information Sharing. To facilitate the coordinated collection and exchange of information, the two projects share an integrated SAP (Appendix B). The SAP outlines the collection of information on groundwater levels, surface water levels, streamflow, and surface water quality to support both plans. Each plan also outlines how information will be shared so that plan implementers have the data necessary to make informed management decisions.

Sampling and Analysis Plan

A.1. Introduction

This document presents the Sampling and Analysis Plan (SAP) to collect the information necessary to support the adaptive management processes of the South Parcel Monitoring Plan and the Restoration Plan for the Sequalitchew Creek Watershed. This SAP is intended to direct collection, processing, and reporting of data by a single, reliable, and consistent source that will be used to inform both adaptive management plans.

A.2. Background

A.2.1. Baseline Monitoring Program

A baseline monitoring program of surface water and groundwater within the Sequalitchew Creek basin is currently conducted by CalPortland as a component of mine planning. The monitoring program generally consists of measuring water levels and flows on a monthly basis at multiple locations in Sequalitchew Creek and its related marshes. The hydrologic monitoring program has four basic elements:

- Groundwater elevation monitoring;
- Surface water elevation monitoring;
- Surface water streamflow monitoring; and
- Surface water quality monitoring (e.g., temperature, dissolved oxygen, and turbidity).

The monitoring program is summarized in Table 1, and monitoring locations are shown on Figure 1.

The baseline monitoring program began in 1999, then expanded significantly in 2003. Monitoring data has previously been presented in four reports (Aspect, 2004a, 2004b; Aspect and Anchor, 2007; and Appendix B of Anchor QEA and Aspect, 2010). The 2004 reports describe the surface water and groundwater systems of the Sequalitchew Creek basin and summarize the monitoring data collected through 2004. The 2007 report presents monitoring data collected in 2005 and 2006. The 2010 report provides summary hydrographs of streamflow and marsh levels, illustrating the data available at that time.

A.2.1.1. Groundwater Level Monitoring

In the baseline monitoring program, groundwater levels are monitored monthly at a network of 20 wells located throughout the watershed, including within the mine area, marshes, and upland areas:

- North Parcel mine area: OB-1
- South Parcel mine area: CHMW-1, CHMW-2S and -2D, CHMW-3S and -3D, and CHMW-4S and -4D
- Marshes and Lakes:
    - Edmond Marsh: MW-EM-1S and -1D, MW-EM-2S and -2D, and EM-3
    - Hamer and McKay Marshes: MW-HM-1
    - Sequalitchew Lake: MW-SL-1
    - Pond Lake: MW-PL-1
- Upland areas: D-3 (near Landfill #5) and SRC-MW-2 (east of Hamer Marsh)

Water levels are measured manually by measuring the depth to water from the top of the well casing. The top-of-casing elevation of each well has been surveyed relative to the National Geodetic Vertical Datum of 1929 (NGVD 29) to allow for calculation of groundwater elevations. Well logs for the existing monitoring wells are provided in Attachment A.

A.2.2. Surface Water Monitoring

A.2.2.1. Water Levels

The baseline monitoring program includes monthly measurement of surface water elevations at 15 locations in the Sequalitchew Creek watershed (Figure 1).

In many locations, staff gages are located close to monitoring wells to allow for coupled observations of surface water and groundwater levels. The following staff gages are included in the baseline monitoring program:

- Bell Marsh: SG-BM-1
- McKay Marsh: SG-MKM-1
- Hamer Marsh: SG-HM-1
- Sequalitchew Creek Marsh: SG-SCM-1 and SG-EM-3E
- East Edmond Marsh: SG-EM-3W and SG-EM-2E
- West Edmond Marsh: SG-EM-1/1A and SG-EM-2W
- Wetland 1D: SG-WL1D-1
- Pond Lake: SG-PL-1

- Diversion Canal: SG-DC-1, SG-DC-2, and SG-DC-3

The typical staff gage installed on this project is an enamel plate capable of measuring water levels in 0.01-foot increments over a 3.33-foot range. The staff gages at the west end of West Edmond Marsh (SG-EM-1/1A) are paired, with SG-EM-1 located near well MW- EM-1 and used to measure higher water levels in winter and SG-EM-1A located in a low spot behind the beaver dam at the outlet and used for measuring lower water levels in summer.

In addition, surface water levels are measured as a component of the three continuous flow monitoring stations described in Section A.2.2.3.

A.2.2.2. Water Quality

Beginning in 2009, surface water quality has been monitored monthly at three locations: the Diversion Weir, the outlet of Hamer Marsh, and the mid-ravine gage on Sequalitchew Creek. Monthly monitoring consists of field measurements of temperature, dissolved oxygen, specific conductance, oxidation reduction potential, and turbidity with a YSI Pro Plus and a Hach Turbidimeter. Several samples have been collected for laboratory analysis for select metals (iron, copper, and zinc) and total petroleum hydrocarbons.

A.2.2.3. Streamflow

The baseline streamflow monitoring program consists of continuous measurements at three stations, periodic measurements at three stations, and visual observations at five locations. The specific locations monitored are:

- Continuous streamflow monitoring at the Diversion Weir, and mid-ravine[1] and lower-ravine stations in Sequalitchew Creek.
- Periodic streamflow measurements at three locations in the Diversion Canal (SG-DC-1, SG-DC-2, SG-DC-3); and
- Visual estimates of flow at five locations:
    - Culvert from Hamer Marsh to Edmond Marsh,
    - Culvert from Sequalitchew Creek Marsh to Diversion Canal
    - Ditch at Plant Road flowing to Hamer Marsh,
    - Sequalitchew Creek at footbridge downstream of W. Edmond Marsh, and
    - Sequalitchew Creek under Center Drive.

Measurements of streamflow are made using the conventional current-meter method as described by the U.S. Geological Survey (USGS, 1982). Stream velocities are measured and discharges are calculated using a SonTek Flowtracker.

Discharge measurements are initially made at various stream stages to determine a relationship between stage and discharge. Discharge measurements are then made at

[1] The mid-ravine station was formerly known as the Upper gage or SC-Upper.

periodic intervals to verify the stage-discharge relationship or to define any change in the relationship caused by changes in channel geometry and/or channel roughness.

Rating curves, which relate water depth to flow in the channel, have been developed for each flow monitoring location based on a number of manual flow measurements collected over a range of different flows. These rating curves are used to convert observed water depths (stage) to flows.

Stream stage at each station is measured using a 4230 Bubble Flow Meter manufactured by Teledyne ISCO and powered by a 12-volt deep-cycle lead-acid battery. The meter uses an internal air compressor to force a metered amount of air through a bubble line submerged in the flow channel. The water level above the bubble line orifice is determined by measuring the pressure needed to force air bubbles out of the line. An internal data logger records the water level as bubbler pressure at 15-minute intervals. The water level is converted to a stage height by correlating the meter readings to manual measurements taken during monthly site visits from a staff gage that is installed at each station. The equipment for the stations is serviced once a month by replacing the batteries and downloading the data to a portable computer.

Flow over the Diversion Weir is monitored by continuously monitoring stage using an ISCO 4230 and calculating discharge with a standard weir equation for a fully contracted rectangular weir from the United States Bureau of Reclamation's (USBR) Water Measurement Manual (USBR, 2001). The weir equation is presented in Section A.5.4.1.

A.2.2.4. Habitat Monitoring

Wetland Habitat

Wetland monitoring conducted to date has been focused on documenting baseline (pre-project) conditions of three key variables in habitats: topography, hydrology, and vegetation. Major changes to the boundary of Edmond Marsh have been analyzed from high-resolution aerial photos, and compared to field-collected data. Twelve vegetation monitoring transects are located throughout the Sequalitchew Creek basin: in Edmond Marsh, Sequalitchew Creek Ravine, Wetland 1D, Pond Lake, and Brackish Marsh. Overall, patterns in species presence detected during the monitoring in the period from 2004–2015 have been documented by Anchor QEA (2016).

Stream Habitat

Anchor Environmental (Anchor; now Anchor QEA) has previously evaluated stream habitat in Sequalitchew Creek using toe-width and stage-discharge analysis methods as a component of the Fish Habitat Benefit Evaluation for Sequalitchew Creek (Anchor, 2004). Additional information on the methodology and background can be found in that document.

The **Toe-Width Method** applies information on active channel width to estimate the optimal flows (maximum habitat) for salmon spawning and rearing. Within Reach 2 and 3, transects were established in areas with fairly uniform depth over a gravel/cobble substrate (5 transects and 4 transects, respectively). Since Reach 1 was located in the estuary, no toe-width transects were established. Additional transects were established to represent riffle habitat in all three reaches.

The **Stage-Discharge Analysis** provides a more detailed evaluation of how habitat availability changes with incremental increases in flow by linking data on the physical relationship between water surface elevation (stage), velocity, and discharge with the biological habitat preferences of spawning and rearing salmon. Stage-discharge relationships in lower Sequalitchew Creek were developed at numerous transects that were selected to be representative of habitat conditions in the study area.

A.3. Roles and Responsibilities

The roles and responsibilities of all key members of the monitoring team are shown in Table 2 below. The monitoring team may be comprised of one or more qualified consulting firms, governmental agencies (e.g., USGS or Ecology), or nongovernmental organizations.

Table 2. Monitoring Team Roles and Responsibilities

Position	Roles and Responsibilities
Project Manager—Monitoring Team	Responsible for oversight of monitoring personnel, coordinating project tasks defined in the Consultant scope of work, tracking project progress and schedule relative to budget, and manage staff to complete project activities.
Principal-in-Charge—Monitoring Team	Responsible for oversight to project team to ensure that QC procedures are followed and project data quality objectives (DQOs) are being met. Oversight of development of project SAP, field audits, and project reports.
Data QC/Reporting Lead—Monitoring Team	Responsible for developing SAP, standard operating procedures (SOPs), and data QA/QC procedures for project. Responsible for managing project database, completing data QC on all project data, and reporting for individual events and the overall project.
Technology Lead—Hydrology/Water Quality	Responsible for the design of each monitoring station. Provide oversight for installation of each station's monitoring system. Provide oversight for monitoring station maintenance and lead equipment troubleshooting activities.
Data Collection Lead—Hydrology/Water Quality	Manages and oversees monitoring and maintenance activities that are completed in the field for hydrology and water quality data collection.
Data Collection Lead—Habitat	Manages and oversees habitat monitoring activities.

A.4. Monitoring Approach

The monitoring conducted under this SAP will collect data necessary to assess whether activities associated with the South Parcel expansion and restoration of Sequalitchew Creek are achieving the objectives of the South Parcel Monitoring Plan and the Restoration Plan for the Sequalitchew Creek Watershed. The monitoring approach is targeted at the specific performance and aspirational thresholds identified in those plans.

The monitoring program includes six components that will be implemented at key locations within the watershed: groundwater level, surface water level, stream flow, surface water quality, habitat, and precipitation monitoring. Each of these components are described below. A cross walk between specific SAP elements and the objectives of the Monitoring Plan and Restoration Plan is provided in Table 3.

In addition to the main monitoring activities, stand-alone special studies will be implemented to address specific concerns of the mine expansion and watershed restoration. These special studies will be developed further as mining and restoration planning progresses, but are described generally in Section A.8.

A.4.1. Groundwater levels

Groundwater levels will be monitored primarily for comparison with the performance thresholds of the South Parcel Monitoring Plan.

Groundwater level monitoring will use the existing network of monitoring wells (described in Section A.2.1 and shown in Figure 1) and new dewatering wells and monitoring wells that will be installed specifically for this project. Water level monitoring will include a combination of spot measurements in active dewatering wells and adjacent temporary monitoring wells, continuous monitoring at key monitoring wells adjacent to the active dewatering area and beneath West Edmond Marsh, and routine monthly or semimonthly monitoring at other wells in the network.

As described in the Monitoring Plan, active dewatering of the South Parcel will occur in three sequential steps, involving progressively more dewatering wells, from 10 wells during Step 1, up to 66 wells during Step 3. Water levels will be measured periodically in the active dewatering wells, in new observation wells located adjacent to the active dewatering wells, and in several long-term monitoring wells installed in the interior of the South Parcel. Water level monitoring at these wells will be used to assess performance of the dewatering operation and, once mining operations commence in the South Parcel, will indicate if the moisture content of the mined aggregate is at appropriately low levels for safe, efficient mining and processing.

Outside of the South Parcel, groundwater level monitoring will consist of a combination of continuous monitoring and monthly or semimonthly manual measurements. During all Dewatering Steps, water levels will be monitored continuously in key wells located along the eastern boundary of the South parcel and in the western portion of Edmond Marsh. Specifically, the following key wells will be monitored continuously: CHMW-1, CHMW-2S and -2D, CHMW-3S and -3D, CHMW-4S and -4D. MW-EM-1S and -1D and MW-EM-2S and -2D. Water levels at all other groundwater monitoring wells will be measured monthly, except during Dewatering Step 2, when twice monthly measurements will occur, and Dewatering Step 3 when twice monthly measurements will occur for 3 months once new dewatering wells start pumping.

Monitoring wells are generally one- or two-inch-diameter PVC casings protected with a locking steel surface monument. Well depths vary from 5 feet for shallow piezometers to 85 feet for wells penetrating the Vashon Outwash gravels. Monitoring well logs are provided in Attachment A.

Continuous groundwater level monitoring will be conducted using a submersible pressure transducer connected to an aboveground data logger housed in a weather-resistant enclosure. Instruments will measure and record water level at 15-minute intervals. Data loggers will be downloaded by field staff at least weekly during Dewatering Steps 1 through 3 and once each month during Step 4.

A.4.2. Surface water levels

Surface water level monitoring data will primarily be used to compare the effects of restoration efforts with the performance and aspirational thresholds specified in the Restoration Plan. Surface water monitoring will occur at 12 stations as shown on Figure 1 and listed in Table 3 (station IDs have a "SG" prefix).

Continuous surface water monitoring will occur at SG-EM-1/1A and SG-EM-2E. Continuous water level data will be useful for assessing the water level response to precipitation. Water level will be measured manually once per month at the other stations; except during Dewatering Step 2, when twice-monthly measurements will occur. More frequent spot measurements will be made during specific restoration activities, such as the installation and adjustment of flexible levelers at beaver dams. New staff gage locations may be installed and added to the monitoring program as necessary to support adaptive management of the flexible levelers.

Surface water level monitoring at the seven locations in Sequalitchew Marsh, East Edmond Marsh, and West Edmond Marsh will provide feedback for efforts to increase westward flows in Sequalitchew Creek. Surface water level monitoring at SG-HM-1 in Hamer Marsh, in concert with groundwater level measurements at MW-HM-1 and MW-EM-3, will assess the increase in subsurface flow from Hamer Marsh to East Edmond Marsh following installation of the weir at Hamer Marsh outlet.

All surface water level monitoring stations are currently equipped with staff gages; either Stevens Style A or C porcelain-enameled iron plate. Style A gages are 3.33 feet long and 4 inches wide with graduated marks every 0.02 feet. Style C gages are also 3.33 feet long and are 2.5 inches wide with graduated marks every 0.01 foot. Water levels are measured to the nearest 0.01 foot. Water level is converted to surface water elevation by subtracting the staff gage height from the surveyed top-of-staff gage elevation and then adding the measured staff gage water level. At SG-EM-1 and SG-EM-2W, continuous water level monitoring will be conducted using a pressure transducer housed in a PVC stilling well that is mounted adjacent to the staff gage. The pressure transducer will be connected to the data logger used for continuous groundwater monitoring at the adjacent groundwater monitoring wells (MW-EM-1D for SG-EM-1/1A and MW-EM-2D for SG-EM-2W).

A.4.3. Streamflow

Streamflow monitoring will include:

- Continuous streamflow monitoring at five locations: the three existing streamflow monitoring stations (i.e., the Diversion Weir, and mid-ravine and lower stations in Sequalitchew Creek) and two new gaging stations on Sequalitchew Creek at the Lake Outlet and at Center Drive.

- Visual observations at the culvert from Hamer Marsh to Edmond Marsh.

At each continuous gaging station, water level will be measured and recorded every 15 minutes using a pressure transducer housed in a PVC stilling well and connected to a data logger that is housed in a weatherproof enclosure. Each continuous stream flow gaging station will include a Stevens Style A or C porcelain-enameled iron-plate staff gage, as described previous for the water level monitoring sites. Water level measured by the pressure transducer will be calibrated to the staff gage at the site. Field staff will service and download the data loggers at least monthly.

At the Diversion Weir, flow will be calculated using a standard discharge equation for a fully contracted rectangular weir as described above in Section A.5.4.1. At the other four gaging stations, stage-discharge or rating curves will need to be developed and maintained to calculate flow. Rating curves will be developed and maintained consistent with industry standard practices, as is currently done.

Flow through the culvert from Hamer Marsh to Edmond Marsh will be visually estimated monthly. Additional locations for visual flow estimates may be added at any time to respond to conditions observed in the field or adaptive management needs.

Following installation of the weir at the outlet of Hamer Marsh, outflow from Hamer Marsh to the Diversion Canal will be determined using the appropriate weir equation, based on water level observations at SG-HM-1, whose staff gage elevation relative the top of the weir will be established.

Continuous flow data from the Diversion Weir will be used to assess achievement of the Restoration Plan performance threshold to reduce flow to the Diversion Canal.

Continuous flow data from the Sequalitchew Lake Outlet and Center Drive gages will be used to assess achievement of the performance standard to match flows at those two locations.

Flow data at Center Drive, Upper Sequalitchew Creek, and Lower Sequalitchew Creek gages will be used to assess achievement of the performance standard to eliminate flow losses in the ravine.

Spot flow measurements at the Hamer Marsh Weir, at the culvert between Hamer Marsh and East Edmond Marsh, and in the ditch under Plant Road to Hamer Marsh, in concert with surface and shallow groundwater monitoring in and around Hamer Marsh, will be used to assess efforts to increase surface and groundwater flow from Hamer Marsh into East Edmond Marsh.

Going forward, the sampling program will no longer collect spot flow measurements in the Diversion Canal, since those data are not relevant to the objectives of the South Parcel Monitoring Plan or the Restoration Plan.

A.4.4. Surface Water Quality

The evaluation of habitat suitability will include monitoring water quality conditions in the watershed restoration area. In particular, stream temperature is predicted to increase in summer as a result of the restoration and mining projects for two reasons: 1) water

temperatures in Sequalitchew Lake are warmer than the groundwater discharge that currently provides the flow in Sequalitchew Creek during summer, and 2) dewatering for mining will reduce the groundwater discharge. Prior monitoring indicates that Sequalitchew Lake temperatures can reach up to 21°C in summer, whereas Sequalitchew Creek is currently 12 to 13°C. This condition is largely natural resulting from solar radiation on the lake surface. However, it also represents the primary tradeoff of restoration—greatly increased flow and reconnection to the natural water source in exchange for higher temperatures in summer.

The water quality monitoring program has been designed to monitor for unintended consequences, primarily focused on temperature, resulting from the restoration and mining projects. Stream temperatures will be monitored continuously at the five locations in the Sequalitchew Creek watershed where flow is measured (Sequalitchew Lake Outlet, Diversion Weir, Center Drive, and mid-ravine and lower ravine Sequalitchew Creek stations), as well as at the continuous water level monitoring stations in East Edmond Marsh (SG-EM-1 and SG-EM-2). The pressure transducers used to monitor water levels will be equipped with temperature sensors and will record water temperature every 15 minutes. The monitoring data will allow for developing temperature profiles along Sequalitchew Creek from headwaters to near the mouth.

These monitoring data will inform the adaptive management components of the Restoration Plan. The Restoration Plan includes several restoration elements that either include specific components that would reduce temperatures, or include flexible elements that could be implemented adaptively in response to monitoring data that indicate unanticipated effects on stream temperature. Specifically, the following elements of the Restoration Plan have components related to temperature, beyond those aimed at increasing flow through the system:

> G – Losing Reach—restoration of riparian vegetation in the losing reach will benefit stream temperature through shading.
>
> J – Ravine Habitat—this element is intended to adapt to habitat conditions that emerge once flow is restored in the ravine. Envisioned as being used to enhance stream structure through large woody debris placement, it could also be used to address temperature issues by creating pools as refugia or shading through riparian plantings.

In addition to temperature, water quality monitoring will include periodic *in-situ* monitoring of temperature, dissolved oxygen, and turbidity at select surface water level monitoring locations.

Periodic *in-situ* water quality measurements of temperature, dissolved oxygen, and turbidity will be collected using portable water quality meters. Measurements will occur monthly, except during Dewatering Step 2, when measurements will be taken twice each month. These water quality data, used in conjunction with measurements of physical habitat characteristics, will inform the assessment of habitat conditions relative to performance thresholds in the Restoration Plan.

A special study of Hamer Marsh water quality will be developed and implemented separately as described in Section A.8.

A.4.5. Habitat

A.4.5.1. Wetland Habitat

The most important effect of the combined mining and restoration projects would be the restoration of a surface water and wetland community connection between the ravine and Edmond Marsh. Data collection discussed in this section is focused on detecting changes to vegetation and habitat structure. This will be used in conjunction with the collection of hydrology data (see section A.5.2) and topography to understand the effects of the project. Hydrology (water surface elevation) data will be used to further understand habitat changes:

- Changes in water surface elevations, particularly in East Edmond Marsh;
- Changes in the magnitude of seasonal fluctuation in water surface elevations;
- Changes in the location and amount of open-water habitat, specifically any loss of open-water habitat in East Edmond Marsh, or greater persistence (later in the growing season) of open water habitats in West Edmond Marsh; and
- The establishment of a surface water and wetland community connection between the ravine and Edmond Marsh.

The baseline wetland habitat monitoring approach (see Section A.2.2.4) will continue to be used to identify patterns in plant species presence, hydrology, and topography under changing conditions along these established transects for comparison and analysis with post-project conditions. New transects will be established between Edmond Marsh and Lower Sequalitchew Creek. Baseline data was not collected in this reach due to the lack of flow and wetland or riparian vegetation during the baseline period.

A.4.5.2. Stream Habitat

Stream habitat will be monitored by measuring physical habitat characteristics at consistent locations over time. Habitat monitoring stations will be established as cross sections of Sequalitchew Creek spaced 100 feet apart for 1,500 feet upstream of the BNSF culvert, then 200 feet apart upstream to the east end of Edmond Marsh. This will provide additional resolution in the area likely to be used for spawning by Chum.

At each section, the following physical parameters will be monitored: flow depth, velocity, substrate size and cover. Cross sections will be monitored in years 0, 1, 2, 3, 5, and 10 commencing prior to construction of the first Restoration Plan element.

Observations of fish presence and active erosion will be noted during the cross-section surveys. Surveys of large woody material will be conducted in years 5 and 10.

A.4.6. Precipitation

Precipitation will be continuously monitored with a tipping bucket rain gage to be located on or near the South Parcel (e.g., City Hall, Pioneer Middle School, or Chloe Clark Elementary). An on-site, program-operated rain gage will likely provide a more complete data set that is of known quality and will better represent precipitation occurring within the watershed than would data from the McMillin Reservoir rain gage, which has been used for prior monitoring efforts.

A continuous precipitation record will provide a context for evaluating short-term changes in surface water and shallow groundwater levels, stream flows, and water quality conditions monitored within the watershed in response to storm events. Observed seasonal precipitation patterns will be used in the analysis of seasonal groundwater and surface water levels, stream flows, and water quality conditions.

The rain gage will be installed at the top of a 1.5-inch-diameter steel pole, approximately 10 feet above the ground surface. The rain gage will be wired to a data logger that will record and totalize rainfall on a 15-minute interval. The data logger will be housed in a durable, weatherproof steel enclosure.

The rain gage will be maintained per manufacturer's recommendations (see Section A.5.7 for methods). The rain gage will be capable of measuring only liquid precipitation (i.e., rainfall or melted snow); it will not be a heated rain gage capable of melting snow. Alternate rain data from the McMillin Reservoir rain gage or PRISM estimates of gridded precipitation for the project area will be used should the project rain gage malfunction.

A.5. Monitoring Procedures

This section provides specific procedural guidelines regarding routine field measurement and maintenance activities pursuant to the monitoring objectives detailed in the previous section.

Campbell Scientific (CSI) pressure transducers and data loggers will be employed at groundwater, surface water, streamflow monitoring stations, which continually measure level and water temperature. A project rain gage will be installed at one of the central monitoring stations, and be recorded by the station data logger. Equipment specifications and installation guidelines for continual monitoring stations includes the following:

- Parameter data (e.g., level, temperature, precipitation) will be recorded at a minimum of 15-minute intervals.
- Transducers selected for each station will be designed with a PSI range and cable length that is appropriate for the range of water levels expected in the observation well or surface water environment.
- Transducer sensor diaphragms will be vented to the atmosphere; eliminating corrections regarding barometric pressure compensation.
- Groundwater pressure transducers will be suspended from a fixed reference point in each monitoring well, at a point below the lowest expected water level. Suspending

the transducer prevents corrosion/interference of benthic sediment, or level discrepancies/drift due to settling.

- Surface water pressure transducers will be installed at a fixed point within a PVC stilling well, adjacent to the station staff plate.
- All level and flow rate measurements will be reported in decimal-feet and cubic feet per second (cfs), respectively.

Water levels measurements at stations recording continuous data will be maintained within a 0.02-foot tolerance. If the difference between the level measured during site inspections and the data logger recorded level is greater than ± 0.02 feet, field personnel will calibrate the data logger recorded level during routine site inspections. Differences in level, as well as calibration points, will be recorded on field sheets. Level drift observed from either the pressure transducer, or movement of the suspension cable, will be corrected by linear interpolation within the project dataset.

A.5.1. Routine Station Inspections

Routine site inspections will occur at least monthly while the project is actively collecting water quality, level, and/or flow data. Field staff will complete a field data collection form, or electronic equivalent, when conducting station inspections (see example in Attachment B). During monthly inspections, all equipment will be maintained per manufacturer recommendation, and include the following tasks:

- Download data logger module records;
- Maintain station grounds for clear and safe access;
- Clean and maintain enclosures, sensors, and monitoring equipment;
- Change/charge station batteries; and
- Calibrate/verify the accuracy, precision, and operation of sampling and monitoring equipment.

All observed and recorded field measurements, as detailed below, will be updated within the project database following routine inspection activities.

A.5.2. Groundwater levels

Groundwater levels are measured in monitoring well stations using a 150- or 300-foot electronic water level indicator. Depth to water is measured from a black mark on the top of the well casing and recorded to the nearest 0.01 foot. The depth to water is converted to a groundwater elevation by subtracting the depth to water from the surveyed top of casing elevations. Groundwater level measurements will be conducted and recorded on field sheets, or electronic equivalents, during each routine site inspection.

The well casings are accessed by unlocking and removing the lids on the steel stick-up-style monuments protecting each well. MW-C5-3 is maintained by JBLM. A key to unlock MW-C5-3 is obtained from JBLM during each site visit.

A.5.3. Surface water levels

Surface water levels are visually observed/measured during routine site inspections from staff plate gages; measured to the nearest 0.01 foot. Water levels will be converted to surface water elevation by subtracting the staff gage height from the surveyed top-of-staff gage elevation and then adding the measured staff gage water level.

A.5.4. Streamflow

Streamflow monitoring for this project will be performed by continuously observing the water level in the stream and calculating flow using one of two methods: a standardized weir-discharge equation or a stage-discharge rating curve.

Stream water levels will be visually observed/measured during routine site inspections from staff plate gages. CSI pressure transducers at continuous-record streamflow stations will be calibrated to the correspond station staff-gage level. Spot level measurements and observations at all other stations will be recorded during routine inspections. All level measurements will be used to calculate and update discharge flow volumes from each station.

A.5.4.1. Weir-Discharge Equations

Streamflow at the Diversion Weir is calculated using a standard discharge equation for a fully contracted rectangular weir from the USBR's Water Measurement Manual (USBR, 2001). The equation relates discharge (Q) to the length of the weir (l) and depth (d) of water over the weir as follows:

$$Q = 3.33*(l - 0.2*d)*d^{(3/2)}$$

It is imperative to maintain flow through weirs free from debris and obstructions, to ensure accurate level/flow measurements. Weir discharge equations will be incorporated into the project database, to ensure precision when field personnel transcribe field observations and measurements.

A.5.4.2. Stage-Discharge Rating Curve

Open-channel streamflow monitoring stations require the development of flow rating curves, which relate observed water depths (i.e., stage) to flow volumes. Rating curves will be developed for each flow monitoring location based on manual flow measurements collected over a range of different flows.

Measurements of streamflow (in cubic feet per second [cfs]) will be made using the conventional current-meter method as described by the USGS (1982). Stream velocities will be measured and discharges are calculated using a SonTek Flowtracker, or other similar velocity meter.

In accordance with the USGS current-meter method, observations of width, depth, and velocity will be made at approximately 10 to 15 intervals in a cross section by wading the stream. The average velocity of each subsection will be taken at 0.6 of the depth below the water surface. That velocity represents the average velocity for that stream subsection, whose cross-section area will be calculated from the corresponding width and

depth measurements. A streamflow measurement is the sum of the flow in each subsection.

The recorded discharge measurements are plotted against corresponding stage heights. The stage-discharge rating (i.e., regression equation) is determined by plotting a best-fit line through a series of stage-discharge points.

Rating curves will be developed at streamflow monitoring stations during a minimum of three (3) different flow event regimes, including flows covering the low-, mid-, and high ranges of the depths expected in each channel. To measure flows at these ranges, field personnel will collect flow measurements during various intensity storm events, as well as baseflow conditions. For existing stations, the rating curves developed during baseline monitoring will be used initially.

Rating curves are evaluated by comparing sets of flow event measurements to determine if the average rating curve for each event graphs similarly on a stage-discharge plot. A change in curve shape or shift in location indicates a change in channel geomorphology and a new rating curve is developed and updated, as necessary. Manual streamflow measurements are made at periodic intervals to verify the rating curve and evaluate if there has been any change in the stage-discharge relationship caused by changes in channel geometry and/or channel roughness. Rating curves were previously developed and reported for the mid-ravine and lower Sequalitchew Creek stations (Aspect and Anchor, 2007), and have continued to evolve since. The rating curves from these stations will be evaluated against new flow-discharge measurements, to ensure updated and accurate rating curves are used.

A.5.5. Surface water quality

Surface water quality parameters, including temperature, dissolved oxygen, pH, and turbidity will be monitored at all surface water stations. Water quality parameters are measured with a YSI Pro Plus multiparameter meter and a Hach Turbidimeter or equivalent instruments.

Surface water temperature will be continually logged by integrated CSI pressure transducer temperature sensors or equivalent equipment (e.g., Onset Hobo/Tidbit© temperature loggers). Temperature sensors will have a minimum accuracy/precision range of +/- 0.2°C. Temperature sensors will be calibrated and maintained in accordance with Ecology's (2015) Standard Operating Procedure (SOP) for Continuous Temperature Monitoring of Fresh Water Rivers and Streams (EAP080). Deployment techniques for temperature sensors/loggers will follow guidance and from Ecology's SOP; however, may vary slightly based on alternative equipment specifications.

Table 4 summarizes the water quality parameters and standard methods that will be employed for the surface water quality monitoring objectives of this project.

Table 4. Water Quality Grab Sample Parameters and Methods

Sample Type	Field Collection Containers	Parameter	Holding Time	Method	Lab Sample Container	Preservative
Continuous	*In-situ* stream or surface water station	Temperature	N/A	Continually logged via CSI pressure transducer, or equivalent	*In situ* (n/a)	*In situ* (n/a)
Grab	1-liter poly	pH	15 minutes	EPA 150.1 via YSI	*In situ* (n/a)	*In situ* (n/a)
		Dissolved Oxygen	15 minutes	EPA 150.2 via YSI	*In situ* (n/a)	*In situ* (n/a)
		Turbidity	15 minutes	EPA 180.1 via YSI	*In situ* (n/a)	*In situ* (n/a)

Manual grab samples will be collected by directly filling sample bottles from the monitoring discharge point, using a “clean hands” approach. The principle of the “clean hands” technique is that field personnel wear appropriate noncontaminating, disposable, powderless gloves during the entire grab sample collection procedure; changing gloves frequently with each change in task.

In-situ measurements with the YSI multiparameter meter may be conducted by directly submerging the sensors into surface waters, so long as there is no interference from bottom sediments or debris.

A.5.5.1. Equipment maintenance

Monitoring equipment will be inspected and serviced as recommended by the manufacturer, or at least once preceding the deployment of temporary monitoring station setups. Generally, equipment maintenance includes: inspection, testing, calibration, and replacement of worn or missing components. Table 5 summarizes the water quality field equipment specifications for this project, including: parameters, decontamination, and calibration procedures.

Table 5. Field Monitoring Equipment Decontamination and Calibration Procedures

Equipment	Parameters	Decontamination Procedure	Calibration Procedures
YSI water quality multimeter, or equivalent	pH; dissolved oxygen	Rinse sensors thoroughly with DI water as needed Store sensors in KCl solution between uses.	Perform the following prior to each site inspection: • Three-point calibration of pH (4,7,10) • Dissolved oxygen using barometric pressure and/or saturation method
HACH Turbidimeter, or equivalent	Turbidity	Rinse sample vials thoroughly with DI water as needed.	Perform reference calibration before every sample period, in accordance with manufacturer specifications.
Continually logged via CSI pressure transducer, or equivalent	Temperature	Gently clean temperature loggers with a soft cloth or soft-bristled brush to remove any biofouling or sediment.	Record ten reference *in-situ* measurements using NIST field thermometer. Compare the mean absolute value of the NIST thermometer measurements against the continuous temperature logger for the same time period; ensure the mean difference isn't greater than 0.2°C.

A.5.5.2. Qualitative Observations

In addition to the quantitative observations of water quality described above, surface water stations will be qualitatively inspected for the following, where applicable:

- Channel conditions, including the presence/absence of beaver dams, downed trees, streambed composition, vegetation, and particularly fast or slow flow velocities.
- Water color, floating oil and grease, floating debris/scum, and materials that may be toxic or harmful to human or other life.

A.5.6. Habitat

Habitat data are collected for two purposes: 1) stream cross sections are measured for comparison with the performance and aspirational thresholds of Goal 2 of the Restoration Plan, and 2) wetland and additional stream habitat measurements are collected to understand the linkages between stream restoration activities and effects on habitat. The wetland and additional stream habitat measurements could inform decisions to employ additional adaptive management strategies or modify existing strategies to limit impacts and/or increase benefits. The supplemental data would not be applicable to the evaluation of performance or aspirational thresholds.

A.5.6.1. Wetland Habitat

Wetland habitat will be measured using established transects with surveyed topography that has been related to surface water monitoring stations. The protocols for point intercept methods for determination of the vegetation community will generally follow Heady et al., 1959. Vegetation data will be collected annually at the end of the growing season (September or October, typically). A tape measure will be strung between fixed points (T-stakes or rebar, typically) and all vegetation species present at each given interval (1-foot or 2-foot, depending on transect length) will be recorded along with the distance from the start of the transect for correlation to surveyed ground surface elevation and surface water elevation data collected throughout the growing season.

A.5.6.2. Stream Habitat

Habitat monitoring stations will be established as cross sections and marked with driven rebar, or similar, in the field. Stations will be spaced 100 feet apart for 1,500 feet upstream of the BNSF culvert, and will be spaced 200 feet apart upstream to the east end of Edmond Marsh. At each section, the following data will be collected, at the frequency indicated in Table 6.

Table 6. Stream Habitat Monitoring Parameters and Methods

Parameter	Method	Precision/ units	Frequency
Depth	Measured every 2 feet within the wetted width of the section using a stadia rod.	0.1 foot	Years 0,1,2,3,5,10
Velocity	Measured at least every 2 feet within the wetted width of the section with a minimum of five measurements using a current velocity meter (Swoffer 2100 or similar).	0.1 feet per second (fps) for velocities between 0.5 and 25 fps	Years 0,1,2,3,5,10
Substrate size	D50 of randomly chosen substrate at least every 2 feet within the wetted width of the section with a minimum of 10 measurements.	1 mm	Years 0,1,2,3,5,10
Cover	Densiometer	Intersects	Years 0,1,2,3,5,10

Additional observations will be collected along the creek and referenced by distance upstream from the BNSF culvert (by station), as shown in Table 7.

Table 7. Additional Habitat Observations

Parameter	Method	Precision/ units	Frequency
Large Woody Material	Repeat existing survey based on methodology by Fox and Boulton (2007).	Count	Years 5, 10
Fish Presence	Visual identification	Species/ size (approx.)/ behavior	0,1,2,3,5,10
Active erosion	Visual identification	Photo documentation with scale	0,1,2,3,5,10

All data, except large woody material, will be collected once per indicated year in November or December when flows are between 100 and 200 percent of mean monthly average flow (or as predicted during years 1 and 2). Data on large woody material can be collected at any time of year.

All data will be presented in an annual monitoring report, including summarization and analysis of the data in terms of the quantity of usable and optimal habitat for Chum spawning and salmonid rearing. Trends over monitoring years will be included along with adaptive management considerations regarding the project performance or this sampling methodology.

A.5.7. Precipitation

For this project, a Hydrological Services Model TB3, or similar, tipping bucket rain gage will be installed at the designated site on the South Parcel. This instrument measures rainfall at 0.01-inch increments. The rain gauge will be connected to a CSI data logger, recording rainfall data at 15-minute intervals. The rain gage will be downloaded at least once each month. Field staff will inspect the rain gage monthly and service as needed. Rain gage calibration checks will occur using the method and at the frequency recommended by the manufacturer.

A.6. Quality Control

This section presents the quality control (QC) requirements for field and laboratory activities associated with this project.

A.6.1. Field

Field measurement equipment, dataloggers, and pressure transducers will be maintained and calibrated every month, at a minimum, to help ensure proper monitoring station operation. Preventative maintenance of the pressure transducers and water quality multimeters will be performed as specified by the manufacturer. The pressure transducers and sensors will be calibrated to the manufacturer's recommendations.

Original field records will be maintained in designated binders for all monitoring and field-related activities using project-specific forms, and guided by the procedures outlined in this SAP. Field documentation will include monthly inspection field sheets, maintenance/calibration logs, COC forms, and other required documentation. All entries in field notebooks will be written in pencil or waterproof ink. When errors are made,

project staff cross-out the error and enter the correct information. All corrections will be initialed and dated. Electronic equivalents of field forms may be used.

Field personnel will employ the following additional field-sample collection QC procedures, as needed:

- Collect grab water quality samples in certified contaminant-free or properly decontaminated containers.
- Use "clean hands/dirty hands" sampling techniques (that is, one team member performs "dirty tasks," while the other member performs "clean tasks," such as handling sample collection bottles).
- Hold samples on ice in coolers during retrieval and delivery to analytical laboratory.
- Deliver samples to analytical laboratory with proper chain of custody, and within holding times.

A.6.2. Laboratory

An accredited laboratory will be contracted to complete additional analyses, as needed, by the inclusion of special studies. Analytical test methods will be standardized and in accordance with procedures approved under 40 Code of Federal Regulations (CFR) §136. The minimum laboratory QA/QC requirements shall also include, but may not necessarily be limited to the following:

- Calibration of analytical laboratory instruments within acceptable limits.
- Periodic inspection, maintenance/servicing, and analysis of quality indicator samples, as necessary, to determine the accuracy and precision of procedures, instruments, and operators.
- Statistical procedures, such as control charts to monitor the precision and accuracy of the analytical data and to establish acceptance ranges and control limits. These data shall be maintained with project records and available upon request or during an audit.
- A continuous review of results to identify and correct problems originating with the instrument, the methodology or the analyst.
- Thorough documentation of the performance of systems, procedures, and operators.
- Certify that electronic data deliverables will exactly match all hard copy data.
- Provide notification of all nonconforming events and conditions, including missed holding times and delays in turnaround time, potentially impacting sample analysis.

A summary of laboratory QA/QC procedures will be requested in the final analytical report deliverables.

A.7. Data Management

This section describes the data management procedures to be used for ensuring access to consistently reliable data. The data management procedure includes 1) recording measurements in the field, 2) downloading data from storage devices in the field, and 3) transferring these data into project databases. There are two separate databases, one for hydrologic data and managed by the hydrology/water quality consultant, and a second for storing vegetation information from the wetland transects and quadrats in the marshes and creek, managed by the habitat consultant. This section defines the structure, inputs, outputs, and quality assurance(QA) and quality control (QC) procedures for the hydrologic database. These data management procedures closely follow those used for current and prior monitoring activities.

A.7.1. Hydrologic Data Collection

Field measurements/observations will be recorded in the field notebook. The field notebook will include the following data sheets: field visit data sheets, field equipment calibration sheets, and the equipment maintenance activity log. Custom field data sheets will be developed for the actual equipment installed. Examples of field data sheets are in Attachment B. Electronic equivalents of field forms may be developed and used.

The Data Collection Lead is responsible for updating and storing the field notebook. The field notebook will be photocopied monthly, and the copy stored at the Consultant's offices. Data loggers will be downloaded onto a project-designated field computer using applicable software and returned to the Consultant's office for transfer to the project database, as described below. Information from field notebook is transcribed into the project database manually. The project data files and database are stored on the Consultant's server, which is to be backed up for disaster recovery purposes at least once per week.

A.7.2. Hydrologic Database Structure

Hydrologic data are stored in an existing central Microsoft Access database created for the ongoing monitoring activities, and a set of specially formatted spreadsheets for ISCO datalogger data. The database will be used to assist with the analysis of groundwater and surface water conditions, and both consolidation and dissemination of information to other parties. The database provides a central storage area for ongoing data collected by Aspect Consulting, LLC and previous data sources, and allows data to be viewed in a uniform manner.

This database is structured such that, whenever possible, user input is validated using predefined formats and common terms making data input fast and simple, while ensuring that data can be accessed reliably through predefined queries. The data management tools in the database include:

- Task/field event setup for verifying completeness of data;
- Manual data entry;
- Querying and reporting tools; and

- Output of graphs and tabulated data.

Additional features designed to protect the integrity of the data and ensure smooth operation of the database include compact on close, tag data additions and modifications with date/time stamp and user id, and "*edit guard*" function that avoids inadvertent editing errors.

Due to the volume of ISCO bubbler data collected since 2004, it is currently managed as a set of Excel spreadsheets that combine to allow storage, correction, and graphing of the raw 15-minute stage data into final analysis and figures.

A.7.3. Database Inputs

Existing hydrologic data currently reside in the database. Data from planned monitoring described in this SAP will be routinely entered into the database as described below.

A.7.3.1. Existing Data

The following types of data were previously input for existing monitoring points:

- Survey coordinates and elevation data for staff gages and well top-of-casing elevations;
- Staff gage and well water level data;
- 15-minute continuous-record stream stage data;
- Stream stage-discharge rating equations for SC-Upper and SC-Lower;
- Standard weir equation for the Diversion Weir; and
- Spot flow measurements.

Existing water quality data is stored in an EQUIS database.

A.7.3.2. New Data

Data inputs from planned data collection include:

- Survey coordinates and elevation data for new staff gages (e.g., at SC-Center Drive gaging station and Sequalitchew Lake Outlet gaging station);
- New surface water staff gage measurements;
- Depth to groundwater measurements from wells;
- Monthly 15-minute stage-height data files for continuous flow and surface water monitoring stations;
- Monthly 15-minute groundwater level data files for continuous groundwater level monitoring stations;
- Monthly 15-minute precipitation data files from on-site rain gage;
- Water quality data;
- New manual streamflow flow measurements; and

- New stream stage-discharge rating equations, as necessary.

Staff gage, depth-to-groundwater, and spot water quality measurements are manually entered directly into the database using the manual data entry form following each field visit. The form includes fields for all monitoring data to help verify completeness.

Continuous stage height, groundwater level, temperature, and precipitation data files are loaded into the database and verified against manual measurements. Manual streamflow measurements and staff gage readings for the Sequalitchew Lake Outlet, SC-Center Drive, SC-Upper, and SC-Lower gaging stations are also entered into MS Excel to evaluate the appropriateness of the current rating curves for each station. When a new rating equation is necessary, it is entered manually into the database and applied to a specific date range for the station.

A.7.3.3. Back-up Precipitation Data

In the event the project rain gage malfunctions, precipitation data from the McMillin Reservoir weather station will be used to fill data gaps, as available. The McMillin Reservoir weather station is located about 20 miles northeast of the project area. This gage was selected as the most appropriate source of back-up precipitation data because it is the closest station with a lengthy period of record, and it receives similar monthly and annual precipitation amounts (Aspect, 2004a).

The precipitation data from McMillin Reservoir are collected as a part of the National Weather Service's (NWC) Cooperative Observer Program (COOP). Electronic files of daily precipitation can be downloaded from the COOP website and imported directly into the database using automated data import routines.

A.7.4. Database Outputs

Figures and tabulated data outputs are generated by an either automated output from the database, or generated via spreadsheet through Tableau. When new figures or tables are desired, water levels and flows are recalculated and printed from their appropriate software.

Water level elevations are calculated in the database, based on the supplied reference elevations for each point. The surveyed elevation of staff gages and monitoring wells is input in the database with a timestamp of when it was measured. Old water levels can be recalculated, based on resurveyed reference elevations when new ones become available.

Raw stage data from the continuous record stream gages is processed with the supplied stage-discharge ratings. Each station has a list of correlations that are applied over a specified time frame—typically for a given year or set of years. From the processed stage data, streamflow in either hourly or 15-minute data intervals is then averaged to mean daily flow for use in graphs and tables.

Precipitation data from the site rain gage is processed to calculate daily, monthly, and annual precipitation totals. Precipitation data at the appropriate time scale is exported to Excel for display on graphs and tables. The data export includes qualifiers indicating the quantity of missing data, if any.

Water quality data are stored and processed in the database. Continuous temperature data will be aggregated to calculate daily and monthly minimum and maximum temperatures as well as the 7-day average of daily maximum temperatures (7-DADMax), which has regulatory significance. Periodic water quality observations will also be output from the database.

A standard monthly report will be developed to assist with routine sharing of information during the mining and restoration projects. The report format will present a summary of observations for the prior month, and compare the observations with relevant performance and aspirational thresholds to determine if the adaptive management processes have been triggered.

A.7.5. QA/QC Protocol

QA/QC protocol for this project fall into three categories, based on which step of data collection and entry is taking place. Data QA/QC occurs during data collection in the field, data entry, and data reporting.

Key components of each QA/QC procedure are summarized below.

A.7.5.1. Data Collection

- The task/field event setup feature identifies all current monitoring points, and organizes them in the order that the data is typically collected on preprinted field forms. This feature helps ensure the completeness of data, especially in the event of field staff turnover.
- While measurements are being collected, the field staff quickly references the previous event's field form to verify the current measurement seems reasonable, and remeasures if necessary.

A.7.5.2. Data Entry

Manual data entry utilizes real-time data verification against defined valid values, acceptable data ranges, expected parameters, and standard data formats. Entries that fall outside these defined parameters will return an error message and reject the data.

A.7.5.3. Data Reporting

After each data entry event, data is reviewed in tabulated and graphical formats. This allows the user to readily identify data outliers and missing values. Data tables and figures will be inspected each month as a final step to verify the completeness and quality of monitoring data.

A.7.6. Data Archival (EIM)

To provide long-term data preservation by a neutral party, data collected under this SAP will be uploaded annually to Ecology's Environmental Information Management (EIM) database: http://www.ecy.wa.gov/eim/. Alternately, data collected by a governmental party with a similar, publicly accessible database (e.g., USGS's Nationwide Water Information System) may be stored in that database.

A.8. Special Studies

This SAP describes the routine monitoring approaches and methods for use in implementing the mining and restoration plans. Those plans also identify several special studies—notably the 60-day pumping test proposed as Step 1 of dewatering, and a study of water quality in Hamer Marsh to determine if it is adequate for improving the connection to Sequalitchew Creek. Specific plans will be developed for these studies, and others that may arise during implementation and adaptive management of the projects.

DRAFT

Project No. 040001-014-03, DuPont, Washington

Plan Objectives			Sampling and Analysis Plan Elements[1]				
			Precipitation	Groundwater Level			
			on-site rain gage	Dewatering Wells	Key Wells: CHMW-1, CHMW-2S&D, CHMW-3S&D, CHMW-4S&D, MW-EM-1S&D, MW-EM-2S&D	MW-BM-1, MW-HM-1, MW-D-3, MW-93-MFS-C5-3, MW-SRC-2, MW-SL-1, MW-EM-3, MW-WLD-1, MW-PL-1	Two new monitoring wells in mine interior
South Parcel Monitoring Plan Objectives	Step 1 - Initial Pumping Test	Groundwater levels at monitoring wells near Edmond Marsh and Sequalitchew Creek are at or above predicted, approved-upon levels.	continuous		continuous	monthly	
		Moisture content of mined aggregate is at appropriately low levels for safe and efficient mining and processing.	continuous	continuous			
	Step 2 - Prep for Mining/ Dewatering Test	Groundwater levels at monitoring wells near Edmond Marsh and Sequalitchew Creek are at or above predicted, approved-upon levels.	continuous		continuous	twice monthly	
		Moisture content of mined aggregate is at appropriately low levels for safe and efficient mining and processing.	continuous	continuous			as needed
	Step 3 - Active Dewatering During Mining	Groundwater levels at monitoring wells near Edmond Marsh and Sequalitchew Creek are at or above predicted, approved-upon levels.	continuous		continuous	twice monthly for 3 months after new dewatering wells are brought on line, then monthly	
		Moisture content of mined aggregate is at appropriately low levels for safe and efficient mining and processing.	continuous	as needed			as needed
	Step 4 - Cessation of Active Dewatering	Groundwater levels at monitoring wells near Edmond Marsh and Sequalitchew Creek are at or above predicted, approved-upon levels.	continuous		continuous	monthly	
		Moisture content of mined aggregate is at appropriately low levels for safe and efficient mining and processing.	continuous	as needed			as needed
Sequalitchew Creek Restoration Plan Objectives	After Elements B, C, and D,	Achieve year-round surface water flow in Sequalitchew Creek from Sequalitchew Lake to the mouth, as climate conditions allow.	continuous				
		Minimize the flow lost to the Diversion Canal.	continuous				
	After B, C, D, and G	Increase access to suitable spawning and rearing habitat in Sequalitchew Creek	continuous				

Notes:

1) additional monitoring locations may be added through adaptive management

* Continue routine monitoring of flow and surface water stations to aid in interpretation of groundwater measurements. Flow and surface water stations do not have Monitoring Plan performance thresholds.

Table 3 - Relationship of Proposed Monitoring to Adaptive Management Thresholds

Project No. 040001-014-03, DuPont, Washington

Plan Objectives			Sampling and Analysis Plan Elements*					
			Flow			Surface Water Level		
			Sequalitchew Lake Outlet	Diversion Weir	Sequalitchew Creek gages (Center Drive, mid-ravine, and SC-Lower)	West Edmond (SG-EM-1/1A and SG-EM-2W)	East Edmond and Sequalitchew Creek Marshes (SG-SCM-1, SG-EM-3E, SG-EM-3W, SG-EM-2E)	Hamer, McKay, and Bell Marshes (SG-HM-1, SG-MKM-1, SG-BM-1)
South Parcel Monitoring Plan Objectives	Step 1 - Initial Pumping Test	Groundwater levels at monitoring wells near Edmond Marsh and Sequalitchew Creek are at or above predicted, approved-upon levels.	* continue routine monitoring			* continue routine monitoring		
		Moisture content of mined aggregate is at appropriately low levels for safe and efficient mining and processing.						
	Step 2 - Prep for Mining/ Dewatering Test	Groundwater levels at monitoring wells near Edmond Marsh and Sequalitchew Creek are at or above predicted, approved-upon levels.	* continue routine monitoring			* continue routine monitoring, but at twice monthly frequency		
		Moisture content of mined aggregate is at appropriately low levels for safe and efficient mining and processing.						
	Step 3 - Active Dewatering During Mining	Groundwater levels at monitoring wells near Edmond Marsh and Sequalitchew Creek are at or above predicted, approved-upon levels.	* continue routine monitoring			* continue routine monitoring, but at twice monthly for first three months after new dewatering wells are brought on line, then monthly		
		Moisture content of mined aggregate is at appropriately low levels for safe and efficient mining and processing.						
	Step 4 - Cessation of Active Dewatering	Groundwater levels at monitoring wells near Edmond Marsh and Sequalitchew Creek are at or above predicted, approved-upon levels.	* continue routine monitoring			* continue routine monitoring		
		Moisture content of mined aggregate is at appropriately low levels for safe and efficient mining and processing.						
Sequalitchew Creek Restoration Plan Objectives	After Elements B, C, and D,	Achieve year-round surface water flow in Sequalitchew Creek from Sequalitchew Lake to the mouth, as climate conditions allow.	continuous		continuous	continuous	monthly	monthly
		Minimize the flow lost to the Diversion Canal.		continuous				
	After B, C, D, and G	Increase access to suitable spawning and rearing habitat in Sequalitchew Creek			continuous	continuous	monthly	

Notes:

1) additional monitoring locations may be added through adaptive management

* Continue routine monitoring of flow and surface water stations to aid in interpretation of groundwater measurements. Flow and surface water stations do not have Monitoring Plan performance thresholds.

Table 3 - Relationship of Proposed Monitoring to Adaptive Management Thresholds

Project No. 040001-014-03, DuPont, Washington

Plan Objectives			Sampling and Analysis Plan Elements*				
			Water Quality		Habitat		
			Temperature at SG-EM-1, SG-EM-2W, Diversion Weir, Sequalitchew Lake Outlet, SC-Center Drive, mid-ravine, SC-Lower	Water quality sampling for DO, turbidity, pH, Temperature at select surface water stations	Cross-section physical characteristics (depth, velocity, substrate,and cover)	Visual Observations (fish presence, active erosion)	Large Woody Material
South Parcel Monitoring Plan Objectives	Step 1 - Initial Pumping Test	Groundwater levels at monitoring wells near Edmond Marsh and Sequalitchew Creek are at or above predicted, approved-upon levels.					
		Moisture content of mined aggregate is at appropriately low levels for safe and efficient mining and processing.					
	Step 2 - Prep for Mining/ Dewatering Test	Groundwater levels at monitoring wells near Edmond Marsh and Sequalitchew Creek are at or above predicted, approved-upon levels.					
		Moisture content of mined aggregate is at appropriately low levels for safe and efficient mining and processing.					
	Step 3 - Active Dewatering During Mining	Groundwater levels at monitoring wells near Edmond Marsh and Sequalitchew Creek are at or above predicted, approved-upon levels.					
		Moisture content of mined aggregate is at appropriately low levels for safe and efficient mining and processing.					
	Step 4 - Cessation of Active Dewatering	Groundwater levels at monitoring wells near Edmond Marsh and Sequalitchew Creek are at or above predicted, approved-upon levels.					
		Moisture content of mined aggregate is at appropriately low levels for safe and efficient mining and processing.					
Sequalitchew Creek Restoration Plan Objectives	After Elements B, C, and D,	Achieve year-round surface water flow in Sequalitchew Creek from Sequalitchew Lake to the mouth, as climate conditions allow.					
		Minimize the flow lost to the Diversion Canal.					
	After B, C, D, and G	Increase access to suitable spawning and rearing habitat in Sequalitchew Creek	continuous	monthly	Years 0, 1, 2, 3, 5 and 10		Years 5 and 10

Notes:

1) additional monitoring locations may be added through adaptive management

* Continue routine monitoring of flow and surface water stations to aid in interpretation of groundwater measurements. Flow and surface water stations do not have Monitoring Plan performance thresholds.

CalPortland -- Dupont, WA

YSI Professional Handheld Multimeter Calibration Record	
CONDUCTIVITY and PH CALIBRATION*	DO CALIBRATION*
1. Press the Cal key. **2. Highlight the parameter you wish to calibrate and press enter. For Conductivity, a second menu will offer the option of calibrating Specific Conductance, Conductivity, or Salinity. Calibrating one automatically calibrates the other two. An additional sub-menu will require you to select the calibration units. For pH, auto-buffer recognition will determine which buffer the sensor is in and it will allow you to calibrate up to 6 points.** **3. Place the correct amount of calibration standard into a clean, dry or pre-rinsed container.** **4. Immerse the probe into the solution, making sure the sensor and thermistor are adequately immersed. Allow at least one minute for temperature to stabilize.** **5. For any of parameters, enter the calibration solution value by highlighting Calibration Value, pressing enter, and then using the alpha/numeric keypad to enter the known value. Once you have entered the value of the calibration standard, highlight <<<ENTER>>> and press enter.** **6. Wait for the readings to stabilize, highlight Accept Calibration and press enter to calibrate.** **7. For pH, continue with the next point by placing the probe in a second buffer and following the on-screen instructions or press Cal to complete the calibration.**	The Pro Plus offers four options for calibrating dissolved oxygen. The first is an air calibration method in % saturation. The second and third calibrates in mg/L or ppm to a solution with a known DO concentration (usually determined by a Winkler Titration). Calibration of any option (% or mg/L and ppm) will automatically calibrate the other. The fourth option is a zero calibration. If performing a zero calibration, you must perform a % or mg/L calibration following the zero calibration. For both ease of use and accuracy, YSI recommends performing the following 1-point DO % calibration: 1. Moisten the sponge in the cal/transport sleeve with a small amount of water and install it on the probe. The cal/transport sleeve ensures venting to the atmosphere. Disengage a thread or two to ensure atmospheric venting. Make sure the DO and temperature sensors are not immersed in the water. 2. Turn the instrument on. 3. Press the Cal key, highlight DO and press enter. 4. Highlight DO%, then press Enter. 5. Verify the barometric pressure and salinity displayed are accurate. Once DO and temperature are stable, highlight Accept Calibration and press enter.

PROJECT REPORT

Project Name: Basin E GW
Site Name: Pioneer Aggregates
Site Address: Pioneer Avenue
City : DuPont
Report Date: 11/25/2020
Gage : 38 IN CENTRAL
Data Start : 10/01/1901
Data End : 09/30/2059
Precip Scale: 1.00
Version Date: 2019/09/13
Version : 4.2.17

Low Flow Threshold for POC 1 : 50 Percent of the 2 Year

High Flow Threshold for POC 1: 50 year

PREDEVELOPED LAND USE

Name : Basin E Pre
Bypass: No

GroundWater: No

Pervious Land Use	acre
A B, Lawn, Flat	3.5
A B, Lawn, Steep	72.1
C, Lawn, Flat	12.7
SAT, Forest, Flat	4.3
Pervious Total	92.6

Impervious Land Use	acre
Impervious Total	0
Basin Total	92.6

Element Flows To:

Surface	Interflow	Groundwater

MITIGATED LAND USE

Name : Watershed E
Bypass: No

GroundWater: No

Pervious Land Use	acre
A B, Lawn, Flat	3.5
A B, Lawn, Steep	72.1
C, Lawn, Flat	12.7
SAT, Forest, Flat	4.3
Pervious Total	92.6

Impervious Land Use	acre
Impervious Total	0
Basin Total	92.6

Element Flows To:

Surface	Interflow	Groundwater
Trapezoidal Pond 3	Trapezoidal Pond 3	

Name : Trapezoidal Pond 3
Bottom Length: 600.00 ft.
Bottom Width: 96.00 ft.
Depth: 7 ft.
Volume at riser head: 9.8477 acre-feet.
Infiltration On
Infiltration rate: 8.1
Infiltration safety factor: 1
Wetted surface area On
Total Volume Infiltrated (ac-ft.): 1091797
Total Volume Through Riser (ac-ft.): 0
Total Volume Through Facility (ac-ft.): 1091797
Percent Infiltrated: 100
Total Precip Applied to Facility: 0
Total Evap From Facility: 0
Side slope 1: 3 To 1
Side slope 2: 3 To 1
Side slope 3: 3 To 1
Side slope 4: 3 To 1
Discharge Structure
Riser Height: 6 ft.
Riser Diameter: 24 in.

Element Flows To:

Outlet 1	Outlet 2

1 Introduction

This report documents the updated analysis used to predict groundwater levels during and after the proposed dewatering and mining of the South Parcel at CalPortland's Pioneer Aggregate facility in DuPont, Washington.

The South Parcel is a proposed 171-acre mining expansion located west of the existing mine and south of the processing area (see Figure 1). Groundwater saturates the gravels of the South Parcel to within 20 feet of the ground surface. Mining will require pumping groundwater to dewater the gravels that are currently saturated. Dewatering and removal of the gravel will result in localized changes in groundwater elevations around the South Parcel.

The foundation of the groundwater analysis is a numerical groundwater model (DuPont model) developed specifically for the project. The DuPont model is based on the conceptual model for the groundwater system developed from extensive analysis of project-specific borings and investigations, as well as compilation and review of other geologic and hydrogeologic investigations in the DuPont area. After development, the model was calibrated to historically observed groundwater levels, then validated against additional historical data. Once the model was able to reliably reproduce historical conditions, the calibrated and validated model was then used to predict the changes in groundwater levels during and after the proposed expansion of mining.

This model represents an update to previous groundwater modeling analysis developed for the South Parcel (CH2M Hill 2003, Aspect 2004a, Aspect 2009a, Aspect 2009b, and Aspect 2014). It incorporates revisions to the mining plan, expansion of the model area, inclusion of seasonal and annual variability in climate and groundwater levels, and elements of the USGS groundwater model for the Chambers-Clover Creek watershed, including model boundary conditions and hydrogeologic layers at depth (Savoca et al., 2010; Johnson et al., 2011).

The model was first developed and calibrated to match existing measured conditions between 2004 and 2010, and then validated to the monitoring data collected through 2015. The model simulation of existing conditions formed the baseline from which changes in future groundwater levels under proposed scenarios can be measured. The model was then used in a series of predictive runs to simulate groundwater conditions at four different steps of dewatering during the proposed mining plan.

This report is organized into the following sections to reflect the process of model development, calibration, and use:

- Section 2 summarizes the groundwater modeling process.
- Section 3 presents a summary of the hydrogeologic conceptual model.
- Section 4 describes the model setup.
- Section 5 describes the model calibration and validation.

- Section 6 describes the DuPont model predictive analysis.
- Section 7 presents model predictions for future mining conditions.

2 Overview of Groundwater Modeling

This section provides an overview of general groundwater modeling methods and terminology, based on multiple sources (Fetter, 1994; Anderson and Woessner, 1992; Hill and Tiedeman, 2007).

Groundwater models are tools used to simulate and predict what cannot be measured directly. Groundwater models quantitatively simulate groundwater flow and groundwater levels using mathematical equations based on the well-established mechanics of fluid flow in porous media.

Generally, the process of developing and testing a robust groundwater model involves the following steps:

1) Monitor groundwater and surface water levels and compile information about area geology and hydrology from numerous sources.
2) Develop a conceptual model of area hydrogeology by interpreting the existing information.
3) Develop a numerical hydrogeologic model that represents the conceptual model.
4) Calibrate the numerical model to observed groundwater measurements.
5) Validate the numerical model with additional groundwater measurements.
6) Predict future groundwater conditions by simulating anticipated changes (e.g., adding pumping wells or changes in topography).
7) Update the model as new information is collected, and refine the model if necessary.

The foundation of a groundwater model is the “conceptual model” that describes the hydrogeologic system based on data collected during field investigations. The reliability of a groundwater model depends on the appropriate translation of the conceptual model into mathematical terms. For example, natural hydrogeologic systems typically include geologic layers with differing hydraulic characteristics (e.g., hydraulic conductivity, storage coefficient). A numerical groundwater model includes a three-dimensional (3-D) grid of cells. Layers with differing hydraulic parameters can be established within the 3-D model grid to best match the natural geologic layering. The influence of surface water features (e.g., creeks, lakes), and flow between groundwater and surface water, can also be simulated within the numerical groundwater model. Because natural hydrologic systems are always variable (heterogeneous) in both space and time, mathematic models are always simplifications of the natural system.

Groundwater models are evaluated based on how well they can reproduce historical observations. Adjustments to groundwater models are made during calibration to improve the comparison between observed and model-calculated conditions. In addition to the calibration process, there is a validation step that compares observed and model-calculated conditions outside the calibration timeframe. For a calibrated and validated

model, the remaining differences between observed and model-calculated conditions are attributed to model bias and uncertainty, which are quantified using statistics.

Once calibrated and validated, the groundwater model is used to forecast conditions after incorporating anticipated hydrogeologic changes. The results of predictive models are interpreted within the context of the calibrated model bias and uncertainty. Post-modeling evaluation is used to provide more accurate forecasts of groundwater conditions, accounting for model bias to the extent practical, and identifying remaining prediction uncertainty.

The DuPont model is developed to predict groundwater level changes in response to the proposed mining plan, which includes active dewatering to accommodate mining, followed by cessation of pumping and establishment of a new hydrologic equilibrium condition. The results from the DuPont model are used for environmental evaluations and for design of the Monitoring Plan that will be followed during mining to directly measure groundwater level changes and thus allow ongoing assessment of, and adaptive response to, potential impacts. As described in this report, the DuPont model is a robust predictive tool developed based on hydrogeologic measurements collected from 2004 to 2015.

2.1 Model Setup

For three-dimensional, finite-difference groundwater models (like the DuPont model), the simulated aquifer system is digitized into a block of cells, including vertical layers of horizontal grids. Each cell is assigned information on cell dimensions, hydraulic conductivity, aquifer storage, and boundary conditions defined below:

- Cell dimensions are the length, width, and vertical thickness of the cell, which may vary with neighboring cells;
- Hydraulic conductivity describes the rate at which water can move through soils represented by the cell, typically distinguishing the horizontal and vertical values (in stratified soils, hydraulic conductivity is typically higher in the horizontal direction, along bedding, than vertically across the bedding);
- Aquifer storage describes the amount of water that can be stored in (or drained from) soils within the cell, typically distinguishing the confined and unconfined values; and
- Boundary conditions are the assigned mechanisms that result in cell-specific flux of water into or out of the model, and can change over time. Boundary conditions may include recharge from precipitation, groundwater underflow from outside the model domain, infiltration from surface water into the groundwater system, drainage from groundwater to surface water, well discharge, etc. Along the sides of a model domain that are parallel to the regional groundwater flow direction, no-flow boundary conditions can be established in a model; where used, no-flow boundary conditions are positioned far enough from areas within the model domain that are of primary interest for a project so that they do not artificially affect the model simulations in that area.

A “steady-state” model simulates average groundwater flow and levels assuming average hydrologic conditions over a specified time period without a change in aquifer storage –

it does not simulate changes over time. Conversely, a "transient" model simulates changes in aquifer storage, groundwater flow, and groundwater levels over time, based on specified changes in boundary conditions. Transient groundwater models are composed of multiple stress periods, and each boundary condition is specified for the length of each stress period. For example, each monthly stress period may specify a groundwater recharge rate based on the monthly rates of incident precipitation, runoff, and evapotranspiration.

A numerical groundwater model calculates a water balance for each cell within the model. For transient models, the water balance is calculated for each cell in each stress period. Because of the large number of calculations involved, groundwater models rely on numerical methods. These numerical methods allow for some small degree of approximation to provide a solution within a reasonable time. For example, a groundwater model may achieve a solution when the difference between calculated groundwater level changes is less than 0.01 foot, and the change in aquifer storage is less than 0.1 percent of the total calculated water balance.

2.2 Calibration

Model calibration is a standard component of groundwater modeling involving a systematic adjustment of cell-specific values assigned for less certain or spatially variable hydraulic parameters (such as hydraulic conductivity) to yield model-calculated groundwater levels that best match observed groundwater levels and minimize model bias. During calibration, adjusted parameter values should remain within a range that is considered reasonable based on the conceptual model.

When further parameter adjustment does not improve the model calibration, the remaining difference between calculated and observed groundwater levels, also called "residual," is attributed to model bias. The uncertainty in model results are quantified using residual statistics, such as the mean residual, the standard deviation of residuals, and the root mean square error of residuals. These statistics may be applied to the entire set of available data to describe the overall model calibration, or applied to groups of available data to describe spatial and temporal differences in model calibration.

Calibrated model results may be further refined using residual statistics to offset model bias. Deterministic regression methods (e.g., well-specific trend-line analysis) may be used where there is sufficient observation data.

Model bias in a calibrated groundwater model is typically due to a combination of causes. These potential causes of model bias are described below.

Conceptual Model. A groundwater model is a mathematical representation of the conceptual model. Elements missing from the conceptual model are not simulated, and may present as potential model bias during calibration.

Model Discretization. A groundwater model is a collection of cells and stress periods, and the properties within these units are averaged over space and time. The cell size defines the "averaging volume", while the stress period length defines the "averaging period". Differences within an averaging volume or averaging period are not simulated, and may present as potential model bias during calibration.

Assumptions. A groundwater model requires assumptions beyond the available data. For example, a model requires information on subsurface conditions between and beyond a network of wells. Making informed hydrogeologic assumptions based on available data is an important element of the modeling process, and may present as potential model bias during calibration.

2.3 Validation

Model validation involves testing a calibrated model for a set of conditions outside the calibration period. The purpose of model validation is to demonstrate the reliability of model results and analysis.

During groundwater model validation, the cell dimensions, hydraulic conductivity, and aquifer storage parameters remain the same as determined in the calibration process. The boundary conditions are modified to reflect changes in recharge rates, groundwater underflow, and surface water infiltration. Then, the calculated and observed groundwater levels are compared to assess model bias, and model bias is evaluated for consistency between the calibration period and the validation period. If the residual statistics are sufficiently similar, then the model is considered validated for those conditions tested.

2.4 Model Bias and Uncertainty

A groundwater model is necessarily a simplified mathematical representation of complex subsurface physical conditions and does not perfectly represent the real-world groundwater behavior. As such, the use of any model introduces bias and uncertainty that the numeric results are exactly correct.

One measure of the uncertainty of a groundwater model is its ability to reproduce the observed data set used for validation. Systematic differences between observed and calculated conditions are due to model bias. For example, model bias helps explain why groundwater levels are generally calculated higher than observed at a given location, and we can objectively adjust model results to account for model bias. Model uncertainty is defined as the “random” differences between observed and model-calculated conditions. For example, model uncertainty helps explain why groundwater levels were calculated higher than observed during some periods, and lower during others. We don’t attempt to adjust model results for uncertainty, but it helps qualify the results. Model uncertainty can be expressed as a range around a specific model result that we can expect the actual groundwater levels to be within.

Additional uncertainty occurs when the model is used for predicting scenarios outside the range of observed baseline conditions. Some examples are:

- Spatial distance – there is greater uncertainty in model predictions for locations at greater distance from existing wells.
- Climatic conditions – there is greater uncertainty when climate conditions are different from those experienced in the calibration and validation periods.
- Decrease in water levels with dewatering – there is greater uncertainty where the decrease in water levels resulting from dewatering is beyond the range of observed water levels.

2.5 Predictive Analysis

Predictive groundwater models use the calibrated and validated model to forecast groundwater conditions associated with a change in hydrogeologic conditions. Some forecasted conditions, such as groundwater levels, can eventually be measured whereas others, such as surface water infiltration, cannot be directly measured. The results of the calibrated/validated model establish “baseline” conditions, and are compared with results from predictive models. This type of difference analysis is typically sufficient for most groundwater model applications (e.g., Johnson et al, 2011). Predictive model results should be interpreted within the context of model bias and uncertainty to make fully-informed decisions.

Predictive model results may be refined to offset model bias. Modified well-specific trend-line analysis, based on the calibrated and validated model refinement and informed by additional constraints, may be used to improve prediction accuracy. Model uncertainty may be quantified based on the calibrated and validated model residual statistics. When a predictive model calculates conditions outside the range of those observed, the model uncertainty increases.

3 Hydrogeologic Conceptual Model

The conceptual model describes the physical geologic and hydrologic conditions understood to exist around the proposed mine expansion. It forms the basis for the numerical model developed to predict groundwater changes as a result of the proposed mining project.

The following sections describe the conceptual understanding of the surface and groundwater system in the project area as it relates to the groundwater model development and predictive analyses. Figures 1, 2 and 3 provide, respectively, a plan map, geologic map and hydrogeologic cross-section for the project area.

3.1 Vashon Outwash Aquifer

The South Parcel expansion lies within a thick glacial outwash sequence near Puget Sound, just north of the Sequalitchew Creek canyon, and east-southeast of the existing mine (Figure 2). The outwash includes the surficial, coarse-grained Steilacoom Gravel flood deposits, overlying older Vashon outwash; the outwash sequence overlies the low-permeability Olympia Beds (Qob) interglacial unit.

The underlying Qob is absent west of a line (termed Qob Truncation and shown in purple on Figures 1 and 2) located on the order of 1,500 to 3,000 feet inland from the current Puget Sound shoreline. During the time of the Vashon glaciation, the Qob's western extent was the shoreline. The shoreline was extended westward to the current configuration during the waning stages of the Vashon glaciation, when glacial outburst flooding deposited a thick deltaic sequence of Steilacoom Gravels into ancestral Puget Sound. Consequently, Steilacoom Gravels extend from ground surface to below sea level west of the Qob Truncation.

The occurrence/non-occurrence of the Qob creates a unique hydrogeologic condition. Groundwater in the outwash east of the Qob Truncation is held up by the occurrence of the thick, low permeability Qob deposits. The cross section (Figure 3) illustrates the steep hydraulic gradient that occurs where the groundwater drops over this feature within the current mine site. As the groundwater flows westerly over the Qob Truncation, it drops roughly 160 feet in 800 feet (0.2 ft/ft) through the permeable gravels to near sea level. Therefore, the water table is found at relatively shallow depths of 15 to 25 feet in the South Parcel area. West of the Qob Truncation, the water table is found at a depth of roughly 190 feet in the existing mine.

Monitoring of groundwater levels began in 2000 with a series of groundwater monitoring wells installed within and around the South Parcel. Groundwater levels in the Vashon Aquifer typically fluctuate 6 to 8 feet in response to seasonal precipitation patterns and annual variations. However, groundwater levels in the central marsh area fluctuate over a more limited range of 2 to 3 feet, whereas monitoring well CHMW-3S, on the south end of the South Parcel, fluctuates greater than 15 feet of seasonally (Aspect 2007). In addition, monitoring conducted for the adjacent Fort Lewis Landfill 5 and DuPont Works Consent Decree area indicate groundwater level variations on the order of 10 feet (URS 2000; URS 2003).

Five pumping tests were conducted along the east side of the proposed South Parcel mine expansion area to determine hydraulic properties of the outwash aquifer throughout its depth (CH2M Hill, 2000). These testing data, along with studies conducted for Fort Lewis Landfill 5 (Woodward-Clyde Consultants, 1991) and the Former DuPont Works site (URS, 2003), provide baseline hydraulic parameters for the Vashon Aquifer used as a starting point in development of the numerical groundwater flow model.

The surficial Steilacoom Gravels are highly permeable and are known to rapidly infiltrate precipitation and stormwater; the veneer of topsoil covering the Gravels is finer grained (can contain volcanic ash) and thus has lower infiltration capacity. The gravels form a relatively flat outwash plain in the area, in the center of which is a series of large wetlands—referred to as Bell, McKay, Hamer, and Edmond Marshes (Figure 1). These wetlands occur in areas where large ice blocks, stranded during the glacial flood outbursts, later melted forming kettle depressions lined with finer-grained, lower-permeability materials. These features store water for a much longer time relative to the rapidly infiltrating gravel outwash around these features. The wetland sediments from throughout the wetland complex were sampled and lab tested for permeability, and these data were used for simulating the wetland areas in the numerical groundwater model.

For purposes of developing the numerical groundwater model, the Vashon Aquifer is represented by two principal zones with distinct permeabilities, separated by a relatively lower permeability zone. The upper zone is comprised of the Steilacoom Gravel, which occurs from groundwater surface to an elevation of approximately 180 to 168 feet above mean sea level and, based on model calibration, has a hydraulic conductivity ranging from 35 to 3,900 feet/day within the model area. At that elevation, there is a lithologic change sometimes indicated by a slightly siltier zone or a slight increase in density during drilling. Below this siltier zone lies the deeper portion of the Vashon Aquifer, comprised of sand and gravel that, based on model calibration, has a lower average permeability, ranging between 0.3 and 49 feet/day. The deeper outwash zone occurs to the depth of the Qob, which occurs at an average elevation of 110 to 120 feet. The two aquifer zones are differentiated on Figure 3 by a dashed line within the Vashon Aquifer in the area of the mine site.

3.2 Connection of Aquifer with Wetlands and Springs

The principal drainage features in the Sequalitchew Creek watershed include Sequalitchew Creek, the Fort Lewis Diversion Canal, and the series of interconnected wetlands through which these drainages flow (see Figure 1). The bulk of the surface water originates at Sequalitchew Lake and from several Fort Lewis stormwater facilities located on the southeast project boundary. The Diversion Canal drains excess surface water from Sequalitchew Lake and the upper marshes (Bell, Hamer and McKay) to Puget Sound, and Sequalitchew Creek provides additional drainage of Edmond Marsh and, to a limited degree, the upper marshes during high-precipitation periods.

Since 2000, monitoring data have been collected to understand the hydraulic connection of the groundwater system with the area wetlands and Sequalitchew Creek system. The monitoring data indicate hydraulic connection between surface water and groundwater through the wetland complex within the upper Sequalitchew Creek drainage. Hydraulic connection is observed by similar water elevations, fluctuations, and time-trends at paired

surface water and groundwater monitoring stations. Hydraulic connection is also indicated in the middle reaches of Sequalitchew Creek where springs (groundwater) discharge to the ravine throughout most of the year. Sequalitchew Creek infiltrates water to the groundwater system in its lowermost reaches.

The monitoring data also indicate that the core wetland areas are generally underlain by fine-grained, low-permeability peat and silt deposits that hold water (Aspect, 2004). Where these peat deposits occur, the amount and rate of surface water that can leak into the groundwater system due to potential future groundwater drawdown would be limited by the natural low permeability of the underlying silts and peats. In other areas, development has removed the naturally low-permeability soils from historical wetland areas; the removal of peat and/or the natural heterogeneity of the soil materials, can create an avenue for greater hydraulic connection and thus wetland response to groundwater change. A summary of our understanding of the hydraulic connection of the groundwater system with the upstream marsh areas is provided below.

3.2.1 Sequalitchew Lake and East Edmond Marsh

The Sequalitchew Lake level is believed to be an expression of the water table, and the monitoring data at the outlet indicates year-round hydraulic connection between the surface water and groundwater in this area.

The principal water supply for Joint Base Lewis-McChord (JBLM) occurs on the eastern side of Sequalitchew Lake where Sequalitchew Springs are located, which are reported to yield as much as 9,000 gallons per minute (gpm) (approximately 20 cubic feet per second [cfs]). Most of the time the springs provide more flow that needed by JBLM for water supply, resulting in surface water outflow from the Lake passing over the Diversion Weir and into the Diversion Canal.

3.2.2 Upstream Marshes—Bell, Hamer and McKay

Surface water levels higher than groundwater levels indicate an influx of surface water in the wet season, with dropping surface water and groundwater levels in the dry season.

3.2.3 Edmond Marsh

Throughout Edmond Marsh, there is connection between surface water and groundwater; however, the connection is greater in the more easterly monitoring stations than in the west marsh area. In the central and eastern areas, stations EM-3 and EM-2 are located adjacent to roadways that, during their construction, may have excavated out the peat deposits. In addition, the creation and maintenances of a channel for Sequalitchew Creek through Edmond Marsh during the years when a fish hatchery operated in Sequalitchew Lake likely disturbed or removed portions of the peat deposits. The westernmost station EM-1 has the least amount of hydraulic connection, presumably because the underlying peat materials are still in place.

These monitoring data indicate an influx of stormwater in the wet season fills the wetland area. Beaver dams help to maintain marsh surface water levels higher than groundwater levels beneath the marshes during the wet season. During the dry season, the surface water and groundwater levels drop. The west end of Edmond Marsh completely dries each year by late spring.

3.2.4 Southern Lakes

A group of lakes (e.g., Grant Lake, Pond Lake, Old Fort Lake and several others) are located in the southwestern most study area. Monitoring data indicates these are water table lakes whose surfaces fluctuate with the groundwater level.

3.2.5 Groundwater Discharges to Sequalitchew Creek Ravine

Groundwater discharges from the Vashon Aquifer as springs in the Sequalitchew Creek ravine below elevations of approximately 195 feet down to the top elevation of the Qob deposits at elevation between approximately 100 to 120 feet, which spans a creek reach of approximately 0.7 miles. Based on stream gaging data, this groundwater discharge varies between approximately 0.5 cfs in the summer to 1.5 cfs in the winter. Progressing downstream past the Qob Truncation, Sequalitchew Creek becomes a losing stream as the water table drops through the outwash to near sea level.

3.3 Deeper Aquifers

Beneath the Qob is the regionally extensive and highly productive Sea Level Aquifer, which occurs throughout the DuPont area between elevations of roughly 50 and -100 feet relative to mean sea level. The Sea Level Aquifer is generally confined beneath the Qob aquitard, and has very limited hydraulic connection with the shallower Vashon Aquifer. West of the Qob Truncation, the Sea Level Aquifer becomes unconfined and its groundwater merges with flow from the Vashon Aquifer in the accumulation of Steilacoom Gravels extending below mean sea level (sometimes referred to as the unconfined Sea Level Aquifer; URS, 2003). Groundwater in the Sea Level Aquifer discharges to Puget Sound via intertidal and subtidal seeps. The Sea Level Aquifer is the City of DuPont's primary water supply source, with their Bell Hill wells No. 1 and No. 3 and Hoffman Hill wells No. 1 and No. 2 completed in it.

Below the Sea Level Aquifer and underlying aquitard unit is a deeper glacial aquifer unit, sometimes termed the Lakewood Aquifer, in which the City of DuPont's Bell Hill No. 2 is completed.

Below the Lakewood Aquifer, two deeper glacial aquifer units separated by interglacial aquitard units were observed during drilling of CalPortland's 1,000-foot-deep water well for the aggregate processing plant. CalPortland's well is completed in the deepest observed aquifer unit, screened between elevations of -685 and -770 feet.

4 Setup of Updated Model

The DuPont model represents a significant update to previous numerical groundwater models used on this project (CH2M Hill 2003, Aspect 2004a, Aspect 2009b)). The updates include changes to the model time period, structure and extent, calibration process, and mining plan scenarios.

Previous models were calibrated to an average "steady-state" condition. The updated model is a transient model calibrated to monthly hydrologic measurements collected from March 2004 through December 2010, and validated to measurements collected through December 2015. The model extent was also expanded to include the area west of the Olympia Beds (Qob) Truncation to Puget Sound to allow for simulation of groundwater discharges in the western portion of the project area. The model also now incorporates deeper geologic layers including the Sea Level Aquifer.

In 2010 and 2011, the USGS published a regional groundwater model that provides additional information outside the boundaries of the prior model, allowing us to supplement our site-specific hydrogeologic data with data from the greater Chambers-Clover Creek watershed (Savoca et al., 2010; Johnson et al., 2011). Elements of the USGS model were spatially correlated and numerically transcribed to the DuPont model.

The DuPont model was calibrated to groundwater conditions based on monitoring data from 2004 to 2010, and validated based on monitoring data through 2015. Overall, these 2004 to 2015 groundwater conditions are referred to as the "baseline." The calibration process used a state-of-the-science parameter estimate program (PEST) and is discussed in Section 5.

The DuPont model was then used to predict groundwater conditions during and after mining. Predictive scenarios representing the major steps in mining and dewatering were developed based on the current mining plan, which differs from prior models in that it no longer includes construction of a north fork of Sequalitchew Creek. Four predictive scenarios representing the planned mining steps (hereafter referred to as Steps 1, 2, 3, and 4) were developed and simulated.

4.1 Model Code

Groundwater flow equations were calculated using the program MODFLOW-SURFACT, version 3 (Hydrogeologic, 2012). This program is better suited than traditional MODFLOW programs for simulating the partially saturated flow conditions that are anticipated will be caused by the proposed mining of the South Parcel. An earlier version of the same software was used for previous modeling efforts.

The DuPont model was developed using an industry-standard computer program, Groundwater Vistas, version 6 (ESI, 2011), as a pre- and post-processor. An earlier version of the same software was used for previous modeling efforts.

The DuPont model was setup to minimize numerical error and provide for a practical computational run time. The head convergence criterion was set to 0.01 feet, which is a setting typical for groundwater models. The cumulative mass balance error was limited to 0.02 percent, which is more stringent than the 0.1 percent criterion for an "ideal" model

(Anderson and Woessner, 1992). The DuPont model requires up to 18 hours for a computational run.

4.2 Model Extent and Grid

Relative to earlier versions of the model, the DuPont model was expanded to simulate boundaries further from the South Parcel, so as to reduce the effects of model boundaries on the central area of interest. The model extent is shown on Figure 4 and the inset shows the DuPont model extent within the context of the regional USGS model extent. Compared to previous models, the DuPont model was expanded to the northwest to include the area beyond (downgradient of) the Qob Truncation. Inactive cells along the northeast and southeast model extents were converted to active cells to include a portion of American Lake as a well-defined surface water boundary condition. Model results for areas closer to the model extents are considered less accurate due to the proximity of model boundaries.

The DuPont model grid coordinate system was updated to be consistent with the project coordinate system and to provide quality assurance for model construction and interpretation of model results. The model horizontal datum is NAD 83 State Plane South in feet. The model vertical datum is NGVD 29 in feet. The model was rotated and offset to better align with the predominant groundwater flow direction. The grid was rotated 44.45 degrees counter-clockwise; and model x,y coordinates were offset 1,097,483 feet east and 653,755 feet north, respectively. The model coordinate, elevation, and offset information allows for georeferencing of model results.

The grid in the DuPont model was refined to reduce potential numerical error and allow greater spatial resolution in results. Grid spacing in the DuPont model was halved from previous models, with a range from 50-foot spacing across the mine property up to a maximum of 250-foot spacing at the model boundaries. This spacing resulted in 268 rows and 198 columns across the DuPont model domain, creating 53,064 cells in each layer and a total of 477,576 cells in the model.

4.3 Model Layers

The DuPont model was constructed with nine layers to simulate five hydrostratigraphic units, which is consistent with the upper five hydrostratigraphic units identified in the USGS model (Johnson et al., 2011). The five hydrostratigraphic units simulated in the DuPont model are, from the surface down:

- Steilacoom Gravel;
- Upper Confining Unit;
- Vashon Outwash;
- Olympia Beds; and
- Sea Level Aquifer.

Table 1 provides a brief description of the hydrostratigraphic units simulated in the model. Figure 7a through 7e provides the thickness and extent of the five

hydrostratigraphic units. Other reports provide a more detailed description of the hydrogeologic conceptual model for the project area, including the hydrostratigraphic units (Aspect, 2004a; Savoca et al., 2010; Johnson et al., 2011). Each hydrostratigraphic unit was simulated as two layers in the model, except the Upper Confining Unit, which was simulated with one layer. Using two model layers allowed integrating the information from co-located monitoring wells into the calibration of vertical hydraulic conductivity within a hydrostratigraphic unit.

4.3.1 Model Top Elevation

The ground surface elevation, shown on Figure 5, was based on available LiDAR surveys and represents the top elevation used in the DuPont model. This surface topography was used in the baseline and predictive simulations of future mining Steps 1 through 3. For future mining Step 4, the surface topography was modified within the South Parcel as shown in Figure 6 to reflect the changes from mining.

4.3.2 Hydrostratigraphic Units

The hydrostratigraphic units and their contact elevations were inferred from the network of mine exploration borings, off-property monitoring well logs, and area-wide cross sections including those developed for the DuPont Mine (Aspect 2004b) and the USGS model (Savoca et al., 2010; Johnson et al., 2011). Where a hydrostratigraphic unit is simulated using two layers, each layer is of equal thickness.

Model Layers 1 and 2 generally simulated the Steilacoom Gravel across the model extent, except where it was inferred to be absent. The areas of greater hydraulic conductivities in Layers 1 and 2 reflect Steilacoom Gravel, whereas areas of lesser hydraulic conductivities reflect glacial till deposits at the surface (Burke Hill, for example) or erosion through deeper hydrostratigraphic units (Sequalitchew Ravine, for example) (Figure 7a). The Steilacoom Gravel was simulated in all layers west of the Qob Truncation, where the main flow channel for the glacial outburst floods was inferred to have discharged.

East of the Qob Truncation, Layer 3 generally simulates a thin layer of finer-grained material (relative to the Steilacoom Gravel above and Vashon Outwash below), and is referred to as the Upper Confining Unit in this report. The lack of obvious till in the borings from the DuPont Mine led us to infer that the Steilacoom Gravel flood outwash may have eroded away most, if not all, of the till within the main flow channel. This is consistent with the hydrogeologic interpretation established for Parcel 1 of the Former DuPont Works Site located south of Sequalitchew Creek (URS, 2003). The USGS mapped till deposits on either side of the main flow channel, and we included that till in our model (see Figure 21 in Johnson et al., 2011). During model calibration, the model did not replicate observed water levels in the Steilacoom Gravel without a finer-grained layer within the flow channel, consistent with the USGS geologic interpretation. Figure 7b shows the Upper Confining Unit east of the Qob Truncation, and Steilacoom Gravel west of the Qob Truncation.

Layers 4 and 5 simulate the Vashon Outwash east of the Qob Truncation, as shown in Figure 7c. Layers 6 and 7 simulate the Olympia Beds east of the Qob Truncation, as shown in Figure 7d. Layers 8 and 9 simulate the Sea Level Aquifer east of the Qob Truncation, as shown in Figure 7e.

The Sequalitchew Creek ravine is an erosional feature created after deposition of the Steilacoom Gravel. As such, the ravine was simulated as cutting through the hydrostratigraphic layers as it descends toward sea level.

In the predictive model simulating the post-mining condition, the hydrostratigraphic units are modified to reflect the effects of mining as described in Section 5.

4.4 Aquifer Parameters

An initial range in aquifer parameter values (including horizontal hydraulic conductivity, vertical hydraulic conductivity, specific yield, and specific storage) was defined for each hydrostratigraphic unit based on data developed in previous studies (Aspect, 2004a; Aspect, 2004b). Aquifer parameter values for the model layers were calibrated using the process described in Section 5 to minimize the difference between observed and model-calculated groundwater levels. The calibrated average values are provided in Table 1.

The DuPont model was updated to allow spatial differences in hydraulic conductivity within a hydrostratigraphic unit. Allowing hydraulic conductivity to vary in this updated model permitted better calibration to the observed transient conditions (note that prior models were steady state and assumed homogeneous hydraulic conductivity within each hydrostratigraphic unit). The spatial distribution of final calibrated hydraulic conductivity is shown for the Steilacoom Gravel hydrostratigraphic unit, the Upper Confining Unit hydrostratigraphic unit, and the deeper Vashon Outwash hydrostratigraphic unit on Figure 8a through 8d.

Other parameters (specific yield, specific storage, and vertical anisotropy—the ratio of vertical to horizontal hydraulic conductivity) were held spatially constant within a hydrostratigraphic unit, as they had been in prior models. Vertical conductivity is calculated based on the horizontal conductivity, which varies spatially, and the vertical anisotropy, which does not. As such, vertical conductivity varies spatially within a hydrostratigraphic unit.

4.5 Model Calibration and Validation Timeframes

The DuPont model calibration timeframe was updated to simulate the period of monitoring from March 2004 through December 2010. The DuPont model simulates 82 monthly stress periods[1], preceded by one “lead-in” period of average conditions for the entire period. The first stress period was included to simulate steady-state average conditions, similar to previous models, and improve the model calibration process.

The roughly 6-year model calibration timeframe is robust in comparison with prior versions of the model and the recent work by USGS. The transient USGS model simulated the 24-month period from September 2006 to August 2008, which was preceded by a 3-year lead-in period.

[1] Stress periods are a time interval within the model when conditions change. Stress periods include multiple time steps for computational purposes, but conditions such as precipitation, pumping rates, or lake water levels only change at the beginning of the stress period.

The DuPont model validation timeframe was updated to simulate the period of monitoring from March 2004 through December 2015, or 142 monthly stress periods. This longer timeframe provided the baseline groundwater conditions for predictive analysis.

The validation timeframe overlaps the calibration timeframe because of a change in the precipitation data source. The model was calibrated using precipitation data from McMillin Reservoir, but beginning in 2012 this data source became unreliable, with significant gaps in coverage. For model validation, the precipitation data source was changed to the PRISM estimates for the McMillin Reservoir (details are presented in Section 4.6.1) for the entire validation period (2004-2015). Using the full period of record for validation allows for validation of the change in precipitation source as well as validating the model in additional years.

The validation period reflects a range of weather conditions, including both relatively wet and relatively dry years, as shown on Figure 9. Figure 9 shows the DuPont model timeframe compared to the USGS model timeframe, within the context of historical annual precipitation. The predictive models used the same 2004 to 2015 timeframe as the baseline model, but with different boundary conditions as noted below. Predictive models simulated dewatering and/or surface drainage during the initial stress period, so as to provide the maximum predicted change in groundwater levels for each phase of mining.

4.6 Boundary Conditions

Model boundary conditions were assigned to best simulate the observed or inferred hydrogeologic conditions, as described below. The predictive models used boundary conditions identical to the baseline model, except as noted below.

4.6.1 Recharge—Net Precipitation

Monthly-variable and spatially-variable recharge values were based on values assigned in the USGS transient model (see Figures 4 and 6 in Johnson et al., 2011; Savoca et al., 2010), which included net precipitation recharge after accounting for runoff, evapotranspiration, and other surficial processes. Figure 10 shows the distribution of average recharge rates across the model extent.

For the calibration time periods outside the USGS model timeframe, recharge values were correlated with precipitation data at the McMillin Reservoir (NWS station 455224), the nearest long-term weather station with a long-term record (active since 1941). The precipitation record for McMillin Reservoir became less reliable in 2012, with more frequent breaks in data collection.

Since the McMillin Reservoir observations no longer had good coverage for the entire model timeframe, a predicted monthly time series for the McMillin Reservoir location from the Oregon State University PRISM Climate Group (OSU 2017) was used instead of the actual weather station observations.

Figure 9 shows a collection of graphs with the following information:

- Annual precipitation (upper left): compares the annual precipitation at McMillin Reservoir with PRISM data, and shows the average annual precipitation with PRISM data and the groundwater model timeframes;

- Annual precipitation exceedance plot (lower left): shows the probability distribution of annual precipitation, highlighting the years during the validation period;
- Monthly precipitation and recharge (upper right): compares the monthly precipitation (bars) and recharge (lines) during the validation period, and shows the model timeframes; and
- Precipitation by month (lower right): shows the range in historical (1942 to 2015) monthly precipitation (high/low lines) and the monthly precipitation during the validation period (scatter plot).

The McMillin Reservoir and PRISM precipitation data sets compare closely with each other, and the switch to using PRISM data for modeling was seamless. The validation period for the DuPont model represents a wide-range in the precipitation recharge, including both relatively wet and relatively dry years and months.

4.6.2 Groundwater Inflow

Groundwater inflow to the model domain was simulated as occurring in three locations: 1) from American Lake, 2) across a portion of the northeast model boundary, and 3) across the southeast model boundary. Figure 11 shows the location of model boundary conditions, including groundwater inflow. The American Lake boundary was defined by monthly-variable specified head cells based on reported and/or precipitation-correlated water levels (Johnson et al., 2011). Groundwater underflow across the northeast model boundary occurs in the Steilacoom Gravel hydrostratigraphic unit (Layer 2) and was defined in the model by monthly-variable specified head cells based USGS model results (Johnson et al., 2011). Groundwater underflow across the southeast model boundary occurs in the Sea Level Aquifer (Layer 9) and was defined by monthly-variable specified head cells based on USGS model results (Johnson et al., 2011). For the period after the USGS model timeframe, specified heads were assigned based on correlations with precipitation patterns. Figure 12 shows a graph of specified heads over time assigned to the groundwater inflow boundaries of the DuPont model.

4.6.3 Infiltration from Wetlands

Wetlands simulated in the DuPont model include Bell Marsh, McKay Marsh, Hamer Marsh, and the Edmond Marsh complex (Table 2). In addition, the channel flowing through East Edmond Marsh was simulated distinctly from the surrounding wetland areas to reflect the “cookie cutter” dredging that occurred in the 1970s to 1990s.

Each wetland area, including the Sequalitchew Creek channel, was treated as a distinct head-dependent boundary condition within the model, as shown on Figure 11.

In a few areas, wetland soils have been removed during historical development activities within the Edmond Marsh complex. Specifically, it was assumed that wetland soils were removed and replaced with sand and gravel fill at the former railroad grade at the Robinson Trail, and along the DuPont-Steilacoom Road. These areas were not included as wetland boundary conditions.

Wetland boundary conditions (drains and rivers) used monthly-variable and spatially-variable heads based on observed staff gage readings during the period of monitoring. Graphs of wetland water depths over time are shown on Figure 13, calculated from observed staff gage readings and the estimated bottom elevation of the wetland. When wetland stages were observed to be dry, the model simulated no water depth. Perched wetland conditions, where the wetland may have surface water ponded above the groundwater table (see Figure 15; Aspect, 2004a), were not simulated with the DuPont model because that water is not in direct hydraulic connection with the groundwater system being simulated.

The connection between the wetlands and the aquifer was defined by river cells with calibrated conductance values simulating a 5-foot-thick layer of peat forming the wetland bottom (see Figure 15; Aspect, 2004a). The wetland properties assigned in the model are summarized in Table 2. Wetland conductance values[2] were calibrated such that the area-weighted average vertical hydraulic conductivity was 0.034 feet per day. This value was consistent with previous peat testing results, which averaged in the range of 0.03 to 0.08 feet per day.

For predictive modeling, the wetland stages were maintained at baseline conditions.

4.6.4 Discharge to Surface Water

Groundwater-to-surface water discharge was simulated for the Joint Base Lewis-McChord (JBLM) water supply overflow, Sequalitchew Lake, the Diversion Canal and drainage, the wetlands complex, and the Sequalitchew Creek ravine. The locations of these boundary conditions are shown on Figure 11, and each is described below. The groundwater model simulates groundwater discharge to surface water, and does not simulate surface water flow due to runoff.

We assumed that groundwater discharged to surface water travels directly to Puget Sound, without potential for re-infiltration to the groundwater system. This assumption may result in the model overestimating drawdown effects from mine dewatering, especially in the area of the Diversion Canal and the Sequalitchew Creek ravine.

4.6.4.1 Joint Base Lewis-McChord Water Supply Overflow

Overflow from the spring water supply for JBLM at the east end of Sequalitchew Lake was simulated to evaluate changes in overflow throughout the mining process. The overflow was defined with a drain cell based on the overflow elevation. Groundwater discharged to this drain cell was assumed to subsequently discharge to Puget Sound via Sequalitchew Lake and the Diversion Canal, without potential for re-infiltration to the groundwater system.

4.6.4.2 Sequalitchew Lake

Sequalitchew Lake was simulated as a reflection of the groundwater table, and was defined by drain cells with monthly-variable heads based on observed lake levels at

[2] Wetland conductance (C) is a model-specific value that depends on the cell dimensions, as shown in the following equation: C = Kv*L*W/m, where Kv is vertical hydraulic conductivity (ft/d), L is cell length (ft), W is cell width (ft), and m is the peat thickness (ft). A higher conductance value allows greater hydraulic connection between wetland surface water and underlying groundwater, and vice versa.

monitoring well MW-SL-1, which is located at the west shore of Sequalitchew Lake. Groundwater discharging to Sequalitchew Lake was assumed to travel directly to Puget Sound via the Diversion Canal, without potential for re-infiltration to the groundwater system.

4.6.4.3 Diversion Canal and Drainage

The Diversion Canal, and the drainage associated with JBLM North were defined by drain cells with heads assigned at the elevation of the ground surface. Losing reaches of the Diversion Canal to the aquifer were not simulated with the DuPont model because that water is not in direct hydraulic connection with the groundwater system being simulated. Except near Sequalitchew Lake, the bottom of the Diversion Canal is generally above the water table, and proposed mining will not affect the flow in the canal or the seepage rates from the canal.

Groundwater model results indicate a shallow water table in the vicinity of JBLM North. We assumed that groundwater discharging to channels or other surface water features on JBLM North travels via the Diversion Canal directly to Puget Sound, without potential for re-infiltration to the groundwater system.

4.6.4.4 Wetlands Complex

Surface water discharge from the wetlands was defined by drain cells with conductance values greater than values for the river cells simulating wetland infiltration. We assumed that surface water discharged from the wetlands was subsequently discharged to Puget Sound via the Diversion Canal or the Sequalitchew Creek ravine, without re-infiltration within the wetlands. Re-infiltration of water to the aquifer from the losing reach of Sequalitchew Creek near Edmonds Marsh was not simulated because of the complexity of surface water/groundwater interaction in this area. This is a conservative assumption because it reduces the amount of water infiltrating to the aquifer along the losing reach, and may result in overestimating the effects of mine dewatering in the vicinity of the losing reach.

Infiltration from the wetlands is discussed in Section 4.6.3.

4.6.4.5 Sequalitchew Creek Ravine

Seepage within the Sequalitchew Creek ravine was defined by drain cells with heads assigned to ground surface to simulate gaining conditions. We assumed that groundwater discharged to these drain cells was subsequently discharged to Puget Sound via Sequalitchew Creek.

4.6.5 Discharge from Dewatering Wells

Dewatering wells were included in the predictive scenarios for future mining Steps 1 through 3. These mining steps represent the phased increase in dewatering efforts through planning, preparation, and execution of mining:

- Step 1 – Initial Dewatering Test
- Step 2 – Preparation for Mining/Expanded Dewatering Test
- Step 3 – Active Dewatering During Mining

Dewatering wells are not included in Step 4 – Cessation of Active Dewatering – because, at that point, all dewatering wells will have been turned off allowing groundwater seeps to develop at the toe of the mined slope. Additional detail about the dewatering plan is presented in the main body of the Monitoring Plan (Aspect, 2017).

The DuPont model was used to simulate the effects of dewatering as though each dewatering step occurred throughout the 11-year baseline period. This approach simulates the effects of the dewatering activities under the range of weather conditions represented by the baseline period.

The DuPont model simulated 10, 24, and 66 dewatering wells along the eastern mine property boundary for Steps 1, 2, and 3, respectively. Figure 14 shows the locations of the proposed dewatering wells during the progressive mining Steps. The simulated wells were screened across multiple model layers for the aquifer above the Olympia Beds, with pumping rates of up to 1 cfs per well. The MODFLOW-SURFACT model code automatically re-allocates pumping to lower layers as upper layers are dewatered, and automatically reduces the pumping rate as the water level approaches the bottom of the well.

Planned re-infiltration of pumped water to the floor of the existing mine will discharge to Puget Sound via the Sea Level Aquifer, and thus will not influence upgradient effects of dewatering and mining in the Vashon Outwash. Simulation of the re-infiltration of the dewatering discharge was not included in the DuPont model as it would occur west of the truncation of the Olympia Beds and thus would not affect water levels in the Vashon Aquifer.

4.6.6 Discharge to the Mined Slope

Groundwater discharge along the toe of the newly mined slope in the South Parcel was simulated for future mining Step 4, and was defined by drain cells with heads assigned at the elevation of the toe of the proposed mine slope (see Figure 5 for post-mining elevations).

4.6.7 Groundwater Outflow

Submarine groundwater outflow to Puget Sound was simulated using drain cells with heads assigned to mean sea level. The locations of boundary conditions, including groundwater outflow, is provided on Figure 11.

4.6.8 No-Flow Boundaries

No-flow boundaries were assigned at the edges of the DuPont model where groundwater flow was inferred to be relatively parallel with the model boundary (Figure 4). This included the bottom of the model (bottom of Sea Level Aquifer), and the sides of the model perpendicular to the shore of Puget Sound, except in layers where information was available to specify head.

5 Model Calibration and Validation

The DuPont model was calibrated by adjusting parameter values to minimize the difference between observed and calculated hydrogeologic conditions. The DuPont model was calibrated to the monitoring data from March 2004 through December 2010. The DuPont model was then updated with monitoring data from January 2011 through December 2015 and validated to the entire March 2004 to December 2015 period.

Similar to the USGS model, the DuPont model was calibrated using a specialized program called PEST, version 12 (Dougherty, 2011), which optimizes a parameter estimation method to provide the best fit within the limits of the available data and assumptions used in the numerical model. Jim Rumbaugh, the software developer for Groundwater Vistas, assisted Aspect with calibrating the DuPont model.

The raw calibration results statistically indicated a good calibration, and were further refined using trend-line analysis to improve matching observed and calculated water levels. The model calibration process is described below, including establishing calibration targets, defining the calibration method, providing the calibration and validation results, and post-processing the model results.

5.1 Calibration Targets

Observed groundwater levels were assigned to the DuPont model as transient calibration targets at the mid-point elevation of the monitoring well screen. Head targets, drawdown targets, and head-difference targets were set up using the same observed water levels, but provide different information to PEST during model calibration. Targets, and their primary calibration parameters, are summarized below:

- Head targets (1,467 total during calibration; 2,503 total during validation) primarily informed the calibration of horizontal hydraulic conductivity values. Head targets were used during validation to calculate residual statistics.
- Drawdown targets (1,467 total) primarily informed the calibration of aquifer storage parameters. In this case, “drawdown targets” applied the same information used for head targets to reflect seasonal changes in water levels (not drawdown due to a pumping well). Drawdown targets were calculated as the arithmetic average water level minus the observed water level on a given date. Drawdown targets were not used during validation.
- Head-difference targets (414 total) primarily informed the calibration of vertical hydraulic conductivity where shallow and deep wells were co-located. In this case, head-difference targets applied the same information used for head targets to reflect the vertical hydraulic gradient. Head-difference targets were not used during validation.

Observed and calculated groundwater levels over time at monitoring wells are presented on Figure 15 (top graphs). Wells with more observations had greater influence on model calibration than those with fewer observations.

Select single-observation targets in the area south of Sequalitchew Creek were used to inform model calibration. These calibration data were assigned for the first stress period to represent average conditions and included the following:

- Groundwater level data from 1994 at monitoring wells that were part of the Remedial Investigation of the Former DuPont Works Site (URS, 2003); and
- Surface water levels from August 2004 at Wetland 8, Wetland 10, Strickland Lake, Grant Lake, and Old Fort Lake (Aspect, 2004b).

5.2 Calibration Methods

Calibration methods followed the guidance provided for highly parameterized inversion (Doherty and Hunt, 2010; Doherty, et al., 2010). Essentially, this guidance allows back-calculating multiple model parameters to result in a best-fit with observed data, while maintaining parameter values within an expected range.

Table 3 provides a list of the model parameters adjusted during the calibration process. The DuPont model calibration was conducted in two stages, as described below:

- The first stage of model calibration refined aquifer parameters and wetland conductance values using zones or reaches of piecewise constancy. Calibration results were used to focus efforts on the most sensitive parameters. Calibrated aquifer parameters included horizontal and vertical hydraulic conductivities, and unconfined and confined aquifer storage values.
- The second stage of model calibration involved refinements to the spatial distribution of hydraulic conductivity within the Steilacoom Gravel, the Upper Confining Unit, and the deeper Vashon Outwash. Calibration methods included the following:
  - Regularization with pilot points, allowing hydraulic conductivity values to vary one order of magnitude from the value determined during the first stage. Previously determined vertical: horizontal anisotropy was maintained. As shown in Table 1, the maximum and minimum calibrated hydraulic conductivity values for a hydrostratigraphic unit are within two orders of magnitude.
  - Singular value decomposition, which internalized sensitivity analysis and reduced the time required for calibration. The calibration process was concluded when successive iterations showed limited improvement in residual statistics (discussed below).

5.3 Calibration Results

The calibrated DuPont model provided a good “fit” between calculated and observed groundwater levels. Consistent with model calibration guidance (Anderson and Woessner, 1992; Hill and Tiedemann, 2007), we evaluated the sufficiency of DuPont model calibration based on comparing observed and calculated groundwater levels from multiple perspectives. First, we evaluated the overall model calibration. Then, we evaluated the transient model calibration for potential trends. Last, we evaluated the

model calibration for each monitoring well. Additional discussion of each step is provided below.

5.3.1 Overall Groundwater Level Calibration

We characterized the DuPont model as calibrated when additional adjustment in model parameters did not improve overall residual statistics, within the constraints of the model setup (Section 3) and the calibration targets and methods (Section 4.1 and 4.2).

A quantitative calibration evaluation, based on statistical analysis, met accepted industry standards for overall model comparison. The overall groundwater level calibration for the DuPont model was quantitatively evaluated using residual statistics for head targets (Table 4). Overall residual statistics were also calculated for drawdown (i.e., seasonal change in water levels) and head-difference targets, and we describe the level of calibration for these targets within the context of head targets for clarity and consistency. A description of common residual statistics is provided below:

- The overall **mean** residual reflects that calculated groundwater levels were 1.8 feet less than observed, on average.
- The overall **standard deviation** of residuals reflects that calibrated water levels were generally within 2.7 feet of the observed value.
- The **sum of squared** residuals is used for identification of specific targets which affect the overall model calibration, discussed further in Section 5.3.3.
- The overall **root mean square error** incorporates information on both the mean and standard deviation, and reflects that calibrated groundwater levels were generally within 3.2 feet of the observed value.

Thus, a broad interpretation of the mean and standard deviation is that the model-calculated groundwater levels across the entire model domain were 1.8 feet less than observed groundwater levels on average, and were usually within 2.7 feet of observed groundwater levels.

Consistent with model calibration guidance, selected residual statistics were scaled to the range of observed groundwater levels to compare with industry standards. The DuPont model calibration focused on groundwater conditions east of the Qob truncation, where the difference between the maximum and minimum observed groundwater levels was approximately 31 feet. The range in simulated groundwater elevations spanned approximately 230 feet (from American Lake to Puget Sound). The scaled standard deviation and root mean square error "*should be less than 10 to 15 percent for a good calibration*" (ESI, 2011). A description of the scaled residual statistics is provided below:

- The scaled standard deviation of residuals was less than 9 percent (2.7 feet / 31 feet) of the observed range.
- The scaled root mean square error of residuals was less than 11 percent (3.2 feet / 31 feet) of the observed range.

Thus, we interpreted the DuPont model as meeting industry standards, and as having a good calibration over the 6 years of observations covering a range of climatic conditions.

Residual statistics were calculated for drawdown (i.e. seasonal change in water levels) and head-difference targets (Table 4). Low values of scaled standard deviation indicate a good model fit. The overall scaled standard deviation of residuals for drawdown was 12 percent of the observed range, and for head-difference was 14 percent of the observed range.

A qualitative evaluation of the overall model calibration showed good agreement between calculated and observed groundwater levels and ranges based on mapped comparisons (Figures 16 and 17). The map on Figure B-13 compares measured to model-calculated water table elevation contours for May 2010. This qualitative calibration evaluation shows good agreement between water table elevation contours across most of the model domain within the context of seasonal variability, with the best agreement in the vicinity of the wetlands that are areas of primary interest for the project. The map on Figure 17 compares the seasonal range in model-calculated and observed groundwater levels. The range in model-calculated groundwater levels (contours) were approximately 86 percent of the observed values (posted values), on average.

5.3.2 Calibration of Groundwater Levels over Time

The DuPont model head calibration results were consistently good during seasonal and annual hydrologic cycles. Transient head calibration results were evaluated over two time scales, monthly and annual, as listed in Table 4, to evaluate if there were temporal trends in the accuracy of the model calibration.

The time-related residual statistics indicate a good annual model calibration with the scaled standard deviation between 8 to 12 percent. There is no discernible trend in the annual residual statistics, which suggests that the model calibration is consistently good during dry and wet years. The monthly residual statistics also indicate a consistently good calibration during dry and wet months, with the scaled standard deviation between 8 and 11 percent.

5.3.3 Calibration of Groundwater Levels at Individual Wells

Overall, individual monitoring wells selected for DuPont model calibration showed good model fit. The calibration was evaluated at individual wells to determine if there were spatial trends in model performance. Calibration at individual wells is summarized in a scatter plot (Figure 18, upper graph), which compares the observed and calibrated groundwater level elevations. Most wells fall close to the 1:1 line that represents the “perfect” model fit.

Based on the validation model results, head target residual statistics for individual wells are provided in Table 5, and are described in more detail below:

- Monitoring wells with fewer observations provided less information for the PEST calibration than other wells. These wells included 88-2-VD and MW-PL-1.
- All monitoring wells had mean residuals that were less than the range of observed values, except 88-2-VD.
- The standard deviation of residuals at any individual well was less than approximately 1.7 feet.

- The sum of squared residuals clearly identifies those wells most influencing the overall model calibration. The shallow and deep monitoring wells at MW-EM-1, CHMW-2, and CHMW-3 have greater mean residuals, and greater sum of squared residuals, than other locations. Although the offset at 88-2-VD is larger than other monitoring wells, the sum of squared residuals is limited by the relatively small number of observations.
- The root mean square error combines the mean and standard deviation of residuals. Based on this statistic, the calibration is better at monitoring wells MW-EM-3, MW-EM-2s and -2d, MW-SRC-2, and MW-HM-1 than at other locations.

The potential causes for poorer calibration at selected wells, identified by greater mean residual, are as follows:

- MW-EM-1S and MW-EM-1D appear to be sensitive to the groundwater and wetland interactions at the discharge point of West Edmond Marsh. Re-infiltration of surface water was not simulated at this location based on limited information for flow rates; ignoring re-infiltration is a conservative assumption with respect to predicting hydrogeologic impacts (see Section 4.6.4.5). Also, surface water was inferred to be seasonally perched above the water table (see Figure 15, Aspect 2004a), and the groundwater model was setup to simulate typical groundwater conditions.
- The shallow and deep monitoring wells at CHMW-2 and CHMW-3 are close to the Qob truncation, and are in areas with greater hydraulic gradients (inferred and calculated) than other monitoring wells. Groundwater levels at these monitoring wells appear to be sensitive where the curving water table crosses hydrostratigraphic contacts near the Qob truncation.

In summary, areas with the best model fit are the central portion of the Edmond Marsh Complex (MW-EM-2s, MW-EM-2d, and MW-EM-3) and the eastern boundary of the South Parcel (CHMW-1 and CHMW-4d) based on the residual statistics shown in Table 5. These areas are also the focus of attention for predicting the effects of proposed mining activities, and model predictions in these areas are considered more reliable than areas with poorer calibration.

5.4 Validation Results

Model validation was conducted, without changing the model construction (model grid/layering and aquifer parameters, to demonstrate that the validity of using PRISM data to assign recharge distribution. We characterized the DuPont model as validated because of the similarity between the calibration and validation residual statistics, as explained in further detail below.

5.4.1 Overall Groundwater Level Validation

The summary table below compares overall residual statistics between model calibration and model validation.

Type (Period)	Mean Residual (feet)	Standard Deviation of Residuals (feet)
Calibration (2004 to 2010)	1.8	2.7
Validation (2004 to 2010)	1.9	2.7
Validation (2011 to 2015)	1.8	2.5

The calibration and validation residual statistics for the period 2004 to 2010 compare closely, and demonstrate that the use of the PRISM data source, in place of the McMillin Reservoir data, was valid. The residual statistics for the period from 2011 to 2015 compares closely to the earlier period, and validates the model results for the conditions simulated.

Table 6 shows the residual statistics for head targets during model validation, and can be compared to Table 4 which provides statistics for head targets during model calibration. Specifically, the residual statistics for the model validation meets the industry standard for a reliable groundwater model.

5.4.2 Validation of Groundwater Levels over Time

Similar to calibration evaluation, the DuPont model head results were consistently validated over two time scales, monthly and annual, as listed in Table 6. Similar residual statistics over time indicated no temporal trends, and validated the model accuracy.

5.4.3 Validation of Groundwater Levels at Individual Wells

Overall, individual monitoring wells in the DuPont model showed good model fit for the validation period. Based on the validation model results, head target residual statistics for individual wells are provided in Table 7. The validation results provided similar well-specific residual statistics as the model calibration results.

The top graphs on Figure 15 show observed and calculated groundwater levels over time at individual monitoring wells. The middle graphs on Figure 15 compare the calculated and observed groundwater levels at individual wells. These graphs illustrate the offset and scatter described in the residual statistics, as well as the ranges in observed and calculated groundwater levels.

5.5 Further Refinement of Model Results

During calibration, the DuPont model was updated by including additional hydrologic complexity to better simulate the observed groundwater conditions. Some real-world complexity could not be incorporated in the model, and resulted in model bias quantified in the residual statistics. Therefore, the raw model results were refined to reduce model bias in groundwater levels calculated at individual wells using deterministic regression methods (Hill and Tiedeman, 2007). Similar methods were also used to improve the accuracy of the predicted groundwater levels (Xu et al., 2012; Doherty and Cristensen, 2011) for individual wells discussed in Section 6.

The trend-line analysis used to refine the model-calculated groundwater levels is shown on Figure 15 for each monitoring well (except 88-2-VD). To avoid introducing additional bias by refining groundwater level results for only wells with poorer calibration, trend-line analysis was performed for all wells. The top plot for each well on Figure 15 shows observed and validated groundwater water levels over time. The middle plot for each well on Figure 15 shows the trend-line analysis for observed and calculated water levels to determine the best-fit line, or "refinement trend line". The best-fit line also accounts for local hydrogeology by establishing a control point at elevation 120 feet NGVD29, which is the approximate contact elevation between the Vashon Outwash and the Olympia Beds. This allows for correlation of model-predicted results outside the range of observed water levels, and is most applicable for wells CHMW-1, CHMW-2, CHMW-3, and CHMW-4. The refined baseline groundwater levels have been corrected for the offset and slope in the refinement trend line, but do not account for the scatter around the 1:1 line. The bottom plot for each well on Figure 15 shows the observed and refined baseline groundwater levels.

Post-model refinement statistics for individual wells are provided in Table 7, and are described in more detail below:

- The refined mean residual was zero for all monitoring wells because the refinement method accounts for the well-specific offset.
- The refined standard deviation of residuals for all monitoring wells was similar to, and less than, the raw calibrated value.
- The refined sum of squared residuals was less than the calibrated value.
- The refined root mean square error was less than the calibrated value, and similar to the refined standard deviation of residuals.

Table 7 provides the refined range in groundwater levels, for comparison with the validation results and observed values. The trend-line analysis results in a range in groundwater levels of approximately 104 percent of observed values, on average.

In summary, the refinement method greatly improves the accuracy of model results, as measured by mean residual and other residual statistics. The refinement method is limited to the model-calculated groundwater levels at head targets, and does not extend to other model results such as groundwater balance analysis.

5.6 Groundwater Balance Analysis

The groundwater balance for the calibrated DuPont model provides baseline conditions to be used for comparison with the predictive future mining. The groundwater balance provides information on water inputs, outputs, and changes in aquifer storage during the model timeframe. Analysis of the components of the DuPont model groundwater balance allows comparison of baseline conditions to predicted conditions during the mining process.

The average values from the models (not including the first stress period) were used for the analysis. The results of the water balance analysis are presented below for the overall

model and for the wetland complex. Observed flows in the Diversion Canal and Sequalitchew Creek ravine were compared to model results.

The trend-line analysis used to refine model-calculated groundwater levels was not applied to the model-calculated groundwater balance. Groundwater balance elements were not monitored directly, and did not serve as model calibration targets.

5.6.1 Overall Groundwater Balance Analysis

The overall groundwater balance is consistent with the description of model boundary conditions above, and is expressed by the following equation:

$$R + GWin + WLinf = Dsw + Dwell + Dmine + GWout + \Delta S$$

Where:

R is recharge to groundwater from precipitation;

GWin is groundwater inflow to the model area;

WLinf is wetland infiltration to groundwater;

Dsw is groundwater discharge to surface water;

Dwell is groundwater discharge from dewatering wells (future mining Steps 1, 2, and 3 only);

Dmine is groundwater discharge into the mine (future mining Step 4 only);

GWout is groundwater outflow from the model area; and

ΔS is change in aquifer storage.

All terms in the water balance equation have units of cubic feet per second (cfs).

Time-averaged groundwater balances are presented on Figure 19, which shows a column chart and a table with rates provided in cfs. For the baseline model:

- Recharge and groundwater inflow represented approximately 13 and 83 percent of all model inflows, on average.
- The average infiltration from the wetland complex was approximately 5 cfs, and represented approximately 3.4 percent of all model inflows.
- The average change in aquifer storage was slightly positive, reflecting the transient boundary conditions assigned in the model, and represented 0.2 percent of all model inflows.
- Average groundwater outflow along the Puget Sound shoreline represented approximately 91 percent of all model outflows.
- Discharge to surface water (e.g., Sequalitchew Lake, wetlands, Sequalitchew Creek, Diversion Canal) represented the balance of model outflows (approximately 9 percent, on average). Dewatering wells were not simulated in the baseline model.

Figure 20 shows a line chart of the baseline model groundwater balance over the model timeframe, with rates provided in cfs. The monthly variability in recharge is largely balanced by changes in aquifer storage and discharge to surface water.

5.6.2 Wetland Complex Groundwater Balance Analysis

For the purposes of the groundwater balance analysis, wetlands were grouped consistent with the previous water balance analysis (Aspect, 2004a) as follows:

- Bell, Hamer, and McKay (BHM) Marshes
- East Edmond Marsh (East EM)
- West Edmond Marsh (West EM)

Time-averaged infiltration and discharge rates for the wetland complex are presented on Figure 21. For the baseline model:

- Infiltration in BHM Marshes represented approximately 29 percent of the total wetland infiltration, on average.
- Average infiltration in East EM, with the peat removed from the “cookie cutter” channel, represented approximately 68 percent of the total wetland infiltration.
- Average infiltration in West EM represented approximately 3 percent of the total wetland infiltration.
- For the combined wetlands, the average groundwater-to-surface water discharge was approximately 19 percent of infiltration from the wetlands.
- Average groundwater-to-surface water discharge rates to the BHM Marshes, East EM, and West EM were approximately 66, 26, and 7 percent, respectively, of total groundwater-to-surface water discharge within the wetlands.

Figure 22 shows a line chart of the infiltration and discharge for the wetland groups under baseline conditions, as well as the net wetland flow. Infiltration rates at the West EM were the lowest, occurred with the lowest frequency, and were the least sensitive to seasonal precipitation patterns, compared to the other wetland groups.

6 Model Predictions for Future Mining Conditions

Following calibration and validation, the DuPont model was used to predict decreases in groundwater conditions during the four sequential future steps of proposed dewatering and mining activity in the South Parcel. As described in Section 4.6.5, dewatering Steps 1, 2, and 3 simulated 10, 24, and 66 active dewatering wells, respectively. Step 4 simulated the post-mining condition with pumping terminated and groundwater passively discharging at the toe of the newly mined slope. For direct comparison with baseline model results, predictive models used the same baseline boundary conditions as the validation model, except for pumping at active dewatering wells.

Model results indicate that pumping rates will equilibrate within one month, and water levels will largely equilibrate within 60 days of a change in pumping rates. For the purposes of this modeling effort, we assumed surface water levels in the wetlands will be similar to historical conditions.

Results of the predictive models are discussed below by dewatering phase, in terms of predicted decreases in groundwater levels. To support the discussion, predicted decreases in groundwater levels are presented in a table, graphs, and maps. Baseline groundwater levels are sensitive to seasonal and longer-term precipitation patterns (e.g., see Figure 15), and groundwater levels during the four dewatering phases are predicted to likewise remain sensitive to precipitation patterns.

For each of the monitoring wells and each of the dewatering steps, Table 8 provides the maximum decrease in groundwater level based on refined model results, with and without including model uncertainty. For the purposes of communicating refined model results, we focus on the maximum decrease in groundwater level without including model uncertainty represented by the values on the left half of Table 8. Additional discussion of model uncertainty is provided in Section 6.5.

Figure 23 provides a collection of graphs comparing groundwater levels (elevations) for each dewatering step by well. The upper graphs on Figure 23 compare baseline groundwater levels and predicted groundwater levels for each of the four dewatering phases. The error bars illustrate the minimum groundwater levels at the 95-percent confidence interval, as a measure of model uncertainty. The 95-percent confidence interval was calculated using the 1-tailed test and the well-specific standard deviation of residuals from the residual statistics for the entire 11-year model validation period. For predictive model results, the 95-percent confidence interval was increased proportional to the average water level decrease at that location. Additional discussion of model uncertainty is provided in Section 6.5.

The middle graphs on Figure 23 show the ranges in monthly groundwater level elevations for baseline conditions and each of the four dewatering phases. The color bars reflect the potential effects of annual hydrologic variability. As described above, the error bars illustrate the minimum groundwater level at the 95-percent confidence interval, as a measure of model uncertainty.

The lower graphs on Figure 23 show the range in monthly groundwater levels decrease from baseline for each of the four dewatering steps. The color bars reflect the potential effects of annual hydrologic variability. As described above, the error bars illustrate the minimum groundwater level at the 95-percent confidence interval, as a measure of model uncertainty.

Figure 24a through Figure 24d shows maps of predicted maximum groundwater level decreases from baseline conditions for each of the four dewatering steps. The contour lines on Figure 24a through Figure 24d are lines of equal groundwater level decrease. Predicted groundwater level decreases during the planned four mining steps are described below.

6.1 Future Mining Step 1: Initial 10-well Dewatering Test

Step 1 dewatering will include 10 active wells located in the northern portion of the South Parcel, as shown on Figure 14. To simulate Step 1, the validated model was modified by adding 10 wells screened across the Steilacoom Gravels and Vashon Outwash. Wells were simulated to pump up to 1 cfs each unless the available drawdown in the well limited the pumping rate. After the first month of pumping all 10 wells, the combined pumping rate is predicted to be approximately 3.6 cfs, on average, and up to approximately 5.5 cfs during the wet season.

Groundwater level decreases are predicted to stabilize within approximately 60 days after pumping starts based on model results. During Step 1, the model-predicted decreases in groundwater levels are most evident at monitoring wells CHMW-2s and CHMW-2D, which are the closest monitoring wells to the proposed location of the Step 1 dewatering wells (see Figure 24a through Figure 24d; monitoring well locations are depicted on Figure 4). At more distant monitoring wells, the predicted groundwater level decreases are less than half the observed range in baseline groundwater levels. The maximum groundwater level decrease at CHMW-2D is predicted to be approximately 8.8 feet. The maximum groundwater level decrease at upgradient monitoring well MW-D-3 (adjacent to the Diversion Canal east of the mine expansion) is predicted to be approximately 1.8 feet. The maximum groundwater level decrease at monitoring wells MW-EM-1D and MW-EM-2D (in Edmonds Marsh) is predicted to be approximately 0.5 foot and 0.1 foot, respectively.

During Step 1, little or no effects on wetlands or groundwater discharge to Sequalitchew Creek were predicted by the model. The overall average wetland infiltration rate is predicted to remain similar to baseline conditions (Figure 19). The predicted average rates of wetland infiltration to groundwater, and discharge from wetland to surface water, are similar to baseline conditions (Figure 21). The timing of net wetland flow (wetland infiltration to groundwater and discharge from the wetland to surface water) is predicted to be approximately the same as baseline conditions (Figure 22). During Step 1, the JBLM water supply overflow showed no significant change in flow rates compared to baseline conditions.

6.2 Future Mining Step 2: Active Dewatering In Preparation for Mining

During Step 2, the dewatering well network will be expanded to the south along the South Parcel mine perimeter as well as adding a few wells in the interior as shown in Figure 14. To simulate Step 2, the validated model was modified by adding 24 wells screened across the Steilacoom Gravels and Vashon Outwash. The dewatering wells are arranged in two lines on either side of the initial mine trough, with 19 boundary wells and 5 inner wells. Wells were simulated to pump up to 1 cfs each unless the available drawdown in the well limited the pumping rate. After the first month of pumping all 24 wells, the combined pumping rate is predicted to be approximately 5.2 cfs, on average, and up to approximately 8.8 cfs during the wet season.

Groundwater level decreases at upgradient monitoring wells are predicted to stabilize within approximately 60 days after pumping starts based on model results. During Step 2, the maximum groundwater level decreases at CHMW-2D and CHMW-1 are predicted to be approximately 45 feet and 5.2 feet, respectively (see Table 8 and Figures 23 and 24). At this step, monitoring well CHMW-2D will be interior to the dewatering well network. The maximum groundwater level decrease at upgradient monitoring well MW-D-3 is predicted to be approximately 4.3 feet. The maximum groundwater level decreases at MW-EM-1D and MW-EM-2D are predicted to be approximately 1.5 feet and 0.2 feet, respectively.

During Step 2, the predicted overall wetland infiltration rate will be approximately 0.2 cfs greater than baseline conditions (Figure 19), assuming wetland water levels are maintained. Most of the predicted changes in infiltration will occur in the East Edmond Marsh area (Figure 21). The predicted timing of net wetland flow will remain approximately the same as baseline conditions (Figure 22). Groundwater discharge to Sequalitchew Creek during Step 2 is predicted to remain similar to baseline conditions. During Step 2, the JBLM water supply overflow showed no significant change in flow rates compared to baseline conditions.

6.3 Future Mining Step 3: Active Dewatering During Mining

Step 3 dewatering was simulated with 66 active wells along the eastern and southern South Parcel mine boundary, as shown in Figure 14. The dewatering wells are arranged in two lines on either side of the initial mine trough, with 54 boundary wells and 12 interior wells. The combined pumping rate is predicted to be approximately 6.9 cfs, on average, and up to approximately 12.2 cfs during the wet season. It may not be necessary to operate all dewatering wells as the final mine trough progresses, once an alternative (passive) dewatering system is in place. However, for the purposes of evaluating the maximum effects of dewatering during Step 3, the DuPont model simulated all dewatering wells operating simultaneously as a conservative assumption.

Groundwater level decreases are predicted to stabilize within approximately 60 days after pumping starts based on model results. During Step 3, the maximum groundwater level decreases at CHMW-2D, CHMW-1, CHMW-4D, and CHMW-3D are predicted to be approximately 51 feet, 60 feet, 15 feet, and 57 feet, respectively (see Table 8 and Figures 23 and 24). The maximum groundwater level decreases at MW-EM-1D and MW-EM-2D are predicted to be approximately 5.1 feet and 0.4 feet, respectively. The maximum groundwater level decreases at upgradient monitoring wells MW-D-3 and MW-93-MFS-C-5 are predicted to be approximately 7.7 feet and 4.2 feet, respectively. The groundwater levels during Step 3 are predicted to be approximately 10 to 20 feet above the Olympia Beds along the mine trough.

During Step 3, the predicted overall wetland infiltration rate will be approximately 0.6 cfs greater than baseline conditions (Figure 19), assuming wetland water levels are constant. Most of the predicted changes in infiltration will occur in the East Edmond Marsh area (Figure 21). Based on model results, the lower groundwater levels under West Edmond Marsh will reduce groundwater discharge to surface water during Step 3 (Figure 22). Groundwater discharge to Sequalitchew Creek during Step 3 is predicted to be 0.5 cfs less than baseline conditions, on average, with the greatest decreases during the wet

season. As with Steps 1 and 2, the JBLM water supply overflow showed no significant change in flow rates in Step 3 compared to baseline conditions.

6.4 Future Mining Step 4: Post-Mining Conditions

During Step 4, pumping from the dewatering well network will cease, groundwater will emanate from the toe of the mined slope, forming wetlands along the toe of the slope and on portions of the mine floor of the South Parcel. Overflow from the wetlands will be collected and conveyed to an infiltration pond on the floor of the existing mine, . As described in Section 4.3.1, the Step 4 ground surface (model top) elevation was modified to reflect the final mine grade (Figure 6) to simulate passive groundwater discharge into the mine. The flow rate of groundwater discharging into the mine is predicted to be 6.9 cfs, on average, and up to 13.7 cfs during the wet season. Collected groundwater discharging into the mine will be re-infiltrated in the western portion of the mine area. The re-infiltration of collected groundwater seeping into the mine will recharge the Sea Level Aquifer and will not affect groundwater levels in the Vashon Outwash aquifer. As such, re-infiltration was not simulated in the DuPont model.

Groundwater level decreases are predicted to stabilize within approximately 60 days after pumping stops based on model results. Groundwater levels will recover slightly relative to the active pumping of Step 3. During Step 4, the maximum groundwater level decreases at monitoring wells along the mine trough (CHMW-2D, CHMW-1, CHMW-4D, and CHMW-3S), are predicted to be approximately 32 feet, 30 feet, 14.0 feet, and 50 feet, respectively. The maximum groundwater level decreases at upgradient monitoring wells MW-D-3 and MW-93-MFS-C-5 are predicted to be approximately 6.6 feet and 3.6 feet, respectively. The maximum groundwater level decreases at MW-EM-1D and MW-EM-2D are predicted to be approximately 4.7 feet and 0.4 feet, respectively (see Figures 23 and 24).

During Step 4, the predicted overall wetland infiltration rate will be approximately 0.5 cfs greater than baseline conditions (Figure 19), assuming stream restoration efforts maintain wetland water levels. Most of the predicted changes in infiltration will occur in East Edmond Marsh area (Figure 21). Based on model results, the result of lower groundwater levels under West EM will reduce groundwater discharge to surface water during Step 4 than during Baseline conditions (Figure 22). Groundwater discharge to Sequalitchew Creek during Step 4 is predicted to be 0.5 cfs less than baseline conditions, on average, with the greatest decreases during the wet season.

During Step 4, the JBLM water supply overflow showed no significant change in flow rates compared to baseline conditions (Figure 19).

6.5 Quantifying Model Uncertainty

All predictions of any groundwater model, including the DuPont model, are subject to uncertainty – for example, in the model parameters and boundary conditions, conceptual model construction, and future conditions. While these some of these uncertainties can be controlled through the robustness of the data collection, calibration, and validation process, they cannot be eliminated and some uncertainties, particularly related to future conditions, are not knowable.

One method for acknowledging uncertainty in model predictions is to quantify the knowable components (i.e., model bias) and incorporate it into the evaluation of future conditions. We can calculate a lower confidence limit on the predicted groundwater levels, then perform environmental evaluations based on those lower limits. If the environmental analyses are still favorable, then we can have increased confidence in the groundwater model and a smaller chance of an adverse outcome.

We calculated a measure of overall model bias based on the scaled standard deviation of the differences between the validated model water levels and the measured water levels at each groundwater monitoring location over the validation period. The scaled standard deviation is the standard deviation divided by the range in the observed water levels. This analysis used the raw validation results, before application of post-modeling refinement. As such, this analysis incorporates uncertainty from the model validation (baseline conditions, without dewatering) and application of the model to the future dewatering scenarios.

A lower 95-percent confidence interval for predicted water levels was calculated by multiplying the scaled standard deviation by the sum of the range in future water levels and the drawdown and the z-value corresponding to a one-tailed 95-percent confidence interval for a normal distribution (i.e., z = 1.28). Expressed mathematically, this uncertainty is equal to:

1.28 * (scaled standard deviation) * (maximum drawdown + observed range).

As an example of this approach, consider monitoring well CHMW-2D. The observed range in water levels from 2004 to 2015 was 6.89 feet at CHMW-2D, and the standard deviation of the validated model is 0.66 feet (Table 7). Thus, the scaled standard deviation is 9.6 percent (0.66 feet/6.89 feet).

The maximum drawdown at CHMW-2D during Step 1 is predicted to be 8.8 feet (Table 8), based on refined model results. The model uncertainty is therefore approximately 1.9 feet (1.28 * 9.5% * (8.8 ft + 6.89 ft). Thus, the maximum predicted drawdown, including model uncertainty, is predicted to be approximately 10.7 feet (Table 8).

Similar calculations were made for each well in each month in each dewatering step, and are the basis for the minimum groundwater levels described in the following section.

6.6 Minimum Groundwater Levels in Each Dewatering Step

A primary use of the output from the predictive model runs is to establish minimum groundwater levels at the various monitoring wells for each dewatering step. These minimum water levels will be evaluated to determine environmental impacts, and if acceptable relative to the mitigation provided by the Restoration Plan, will be used as performance thresholds for the dewatering program. Measured groundwater levels below the performance threshold would trigger adaptive management, as described in the South Parcel Monitoring Plan (Aspect, 2017).

The minimum groundwater levels for each monitoring well, in each month, in each dewatering step are provided in Table 9. These minimum groundwater levels are the 95% lower confidence interval for the groundwater level predicted by the DuPont Model, and have been calculated for each existing monitoring well for each month of each

dewatering step. Minimum groundwater levels can be calculated with the DuPont Model for any new monitoring wells once the location has been determined.

Steps 1 and 2 will not last through all months of a year, but precise starting months and duration are not firmly established. Minimum groundwater levels were calculated for all months to allow flexibility in the future.

Table 1: Summary of Hydrostratigraphic Units and Calibrated Parameter Values

Project #040001 -South Parcel Mine Expansion
Dupont, WA

Hydrostratigraphic Unit in DuPont Model	Correlated USGS Hydrogeologic Unit and Partial Description	Principal Layers in DuPont Model	Horizontal Hydraulic Conductivity (feet/day)					Vertical Anisotropy (-)	Specific Yield (-)	Specific Storage (1/foot)
			Max.	75 percentile	Average	25 percentile	Min.	horizontal: vertical		
Steilacoom Gravel	A1 – "recessional outwash…sand and gravel deposited by large meltwater streams…"	1,2	3,900	1,600	1,100	350	36	2.7	0.07	6.1E-05
Upper Confining Unit	A2 – "low-permeability unit composed of Vashon till and lesser amounts of ice-contact, moraine and fine-grained glaciolacustrine deposits…"	3	1.61	0.47	0.33	0.16	0.017	1.0	0.07	5.0E-05
Vashon Outwash	A3 – "aquifer composed of Vashon advance outwash…"	4,5	49	11	7.7	2.4	0.27	15.1	0.09	2.7E-05
Olympia Beds (Qob)	B – "low-permeability unit composed of fine-grained silts and clays deposited during the Olympia interglacial…"	6,7	0.018 (uniform)					10.0	0.09	1.1E-04
Sea Level Aquifer	C – "aquifer composed of pre-Olympia glacial drift deposits consisteing of sand and gravel…"	8,9	690 (uniform)					6.3	0.18	6.0E-05

Table 2: Summary of Wetland Properties used in Model

Project #040001 -South Parcel Mine Expansion
Dupont, WA

	Drain and River Cells			River Cells Only			
Wetland	Area In Model (acres)	Staff Gage(s) used to Establish Stage	Average Stage (feet)	Average Vertical K (feet/day)	Average Bottom Elevation (feet)	Wetland Water Depth (feet)	
						Average	Standard Deviation
Bell Marsh	11	SG-BM-1	218.4	0.55	215.6	2.8	1.0
McKay Marsh	35	SG-MKM-1	215.2	0.0086	213.6	1.6	1.1
Hamer Marsh	67	SG-HM-1	213.7	0.0090	211.7	2.0	0.9
East Edmond Marsh (JBLM)	25	SG-EM-3E, SG-SCM-1	212.1	0.020	210.0	2.1	0.5
East Edmond Marsh (JBLM) - Channel	10		212.1	11	210.0	2.1	0.5
East Edmond Marsh	27	SG-EM-2E, SG-EM-3W	211.9	0.0013	210.0	1.9	0.5
East Edmond Marsh - Channel	8		211.9	39	210.0	1.9	0.5
West Edmond Marsh - Eastern	29	SG-EM-2W, SG-EM-1/1A	210.4	0.0010	207.7	2.7	0.4
West Edmond Marsh - Middle	25		208.9	0.0026	206.6	2.2	1.1
West Edmond Marsh - Western	7		207.4	0.0015	205.8	1.6	1.4

Notes:

Wetlands were simulated with drains cells (for surface runoff) and river cells (for connection with aquifer) across the same areas, and with the same stage values.

The wetland area was assigned based on historical aerial photos.

Monthly-variable stages were assigned based on staff gage observations. Where two staff gages were used, stages were linearly interpolated.

Drain cells were uniformly assigned a vertical hydraulic conductivity (vertical K) of 10 feet per day.

Vertical K for river cells was calibrated.

The wetland bottom elevation was estimated.

The wetland peat was assigned a thickness of 1 foot.

The wetland water depth provides information on seasonal differences in water levels.

Table 3: Parameters Adjusted during Calibration

Project #040001 -South Parcel Mine Expansion
Dupont, WA

Hydraulic Conductivity		
Hydrostratigraphic Unit	***Horizontal Hydraulic Conductivity***	***Vertical Hydraulic Conductivity***
Steilacoom Gravel	Regularization with Pilot Points	Anisotropy Maintained
Upper Confining Unit	Regularization with Pilot Points	Anisotropy Maintained
Vashon Outwash	Regularization with Pilot Points	Anisotropy Maintained
Olympia Beds	Piecewise Constancy	Anisotropy Maintained
Sea Level Aquifer	Piecewise Constancy	Anisotropy Maintained
Storage Coefficients		
Hydrostratigraphic Unit	***Specific Yield***	***Specific Storage***
Steilacoom Gravel	Piecewise Constancy	Piecewise Constancy

Notes:

1. Model predictions are presented at the typical field-measurement precision (0.01 ft).
2. Maximum Change in Water Level based on refined model results.
3. Maximum Change in Water Level calculated for 95% lower confidence interval for 1-tailed test.
4. Shaded values indicate forecasted change in water level exceeds half the range in observed values.

Legend

- **Qf (Fill)**
  Artificial fill. Likely consists primarily of crushed rock and rip-rap placed for railroad embankment.
- **Qw (Wetland Deposits)**
  Peat, organic-rich muck, silt and clay.
- **Qal (Recent Alluvium)**
  Silt, sand, gravel, and peat deposited in stream beds and estuaries, includes some lacustrine and beach deposits.
- **Qvr (Vashon Recessional Glacial Outwash)**
  Medium dense to dense, slightly silty to clean sand and gravel. Includes some silty beds. The majority of near-surface Vashon recessional outwash on the Project Site is made up of the Steilacoom Gravel member, which is composed of sandy gravel and gravelly sand, with minor amounts of silt.
- **Qvi (Ice-Contact Deposits)**
  Water-worked sands and gravels with interbeds and lenses of silty, till-like deposits.
- **Qvt/Qvi (Till and Ice Contact Deposits)**
  Dense to very dense discontinuous layers of silty, sandy, and gravelly basal till. Ice contact deposits contain water-worked sands and gravels with interbeds and lenses of silty, till-like deposits.
- **Qva (Vashon Advance Glacial Outwash)**
  Sand and gravel, and lacustrine clay, silt, and sand of northern source, deposited during Vashon glacial advance.
- **Qob (Olympia Beds)**
  The Olympia Beds Qob unit is generally composed of interbedded lacustrine silt and clay and fluvial deposits.
- **Olympia Beds Truncation (Surface Projection)**
  Approximate surface projection line showing the northwestward lateral subcrop extent of the Olympia Beds unit. Dashed where approximate, dotted where inferred.

Note: Map modified based on subsurface data and geologic interpretation from Walsh, Logan and Polenz 2003; Walsh et al. 2003, Walters and Kimmel, 1968, and Troost, Booth, and Borden, in review.

A Performance Thresholds: Predicted Changes and Ranges in Groundwater Levels

B Sampling and Analysis Plan

1 Introduction

This document presents the Monitoring Plan for dewatering of the South Parcel of CalPortland's DuPont Mine. The South Parcel is a 177-acre property located southeast of the existing mine, shown on Figure 1. CalPortland proposes to expand the existing mine by extracting sand and gravel from the South Parcel. Groundwater saturates the lower level of gravels that are proposed for extraction. For mining to occur, these gravels of the South Parcel would need to be dewatered by installing a series of pumping wells to capture groundwater. The dewatering activity would affect groundwater levels in the surrounding area.

In 2011, CalPortland, the City of DuPont, Washington State Department of Ecology (Ecology), and a group of seven environmental organizations collectively known as the Environmental Caucus entered into a Settlement Agreement to define the conditions under which mining of the South Parcel could occur. The Settlement Agreement requires the development and permitting of a Restoration Plan for the Sequalitchew Creek watershed. It also requires the development of a Monitoring Plan for ensuring that changes in groundwater levels resulting from dewatering are within expected (and agreed-upon) limits.

Section 7.3 of the 2011 Settlement Agreement specifies that the Monitoring Plan will *"…include a series of monitoring actions to allow a comparison of predicted and actual changes in groundwater draw-down levels, and a process for the Parties to meet and confer if groundwater monitoring results do not meet the criteria provided in the Monitoring Plan."* This document was developed to meet that requirement.

The aim of the Restoration Plan is to increase available habitat for aquatic species through the restoration and enhancement of creek flow from Sequalitchew Lake to the Puget Sound. The Restoration Plan includes the following restoration actions, among others: comprehensive beaver management to restore flow from Sequalitchew Lake to West Edmond Marsh, improvements to the outlet of Sequalitchew Lake to reduce barriers to flow down the creek system, rehabilitating fish passage through the DuPont Railroad Trail by replacing a section of trail that is built on fill with a pedestrian bridge, culvert evaluation and replacement, and habitat restoration in Sequalitchew Creek downstream of Edmond Marsh. Implementing these actions will involve changes to marsh water levels and increases in Sequalitchew Creek flows.

The Restoration Plan actions are intended to occur concurrently with South Parcel mining activities. Under the terms of the Settlement Agreement, mining of the South Parcel cannot commence until all necessary permits for the Restoration Plan have been obtained. The Restoration Plan will include a monitoring component aimed at measuring the success of restoration actions and adaptively responding if goals are not met.

As specified in the Settlement Agreement, this Monitoring Plan focuses on observing and responding to changes in groundwater levels. Marsh water levels and streamflows will

also be monitored (as required by Section 7.2 of the Settlement Agreement), but they are not the focus of the adaptive management actions identified in the Monitoring Plan.

This Monitoring Plan consists of three components:

1) The main text, which outlines the framework for monitoring and decision making at a conceptual level.

2) A set of figures illustrating the performance thresholds for each month at each well in each dewatering step (Appendix A).

3) A sampling and analysis plan (SAP; Appendix B), which provides the specific details of monitoring, such as identification of monitoring locations, parameters, and frequency, as well as monitoring methods.

The parties acknowledge that the Monitoring Plan may be updated or amended by mutual agreement of the parties.

2 Goals and Objectives

This Monitoring Plan strives to monitor and respond to maintain groundwater at or above predicted levels beneath the marshes and Sequalitchew Creek, and manage groundwater to maintain conditions conducive to safe and efficient mining in the South Parcel.

Articulating the specific goals, objectives, and performance thresholds of a plan provides clarity in measuring the success of the actions taken and guidance for managing unanticipated circumstances. Goals are the overarching principles behind the Monitoring Plan. Objectives identify specific, measurable elements that are undertaken to meet the goal(s) of a project. They provide more detail on how the goals will be achieved, and criteria for determining when their achievement has occurred.

For each objective, a performance threshold is identified to measure success in meeting that objective. Failure to meet the performance threshold will trigger the adaptive management process and require iterative additional actions until it is met. If monitoring indicates that a performance threshold is not being met, additional action will be necessary and the adaptive management process (described in Section 4) will be used iteratively to identify and implement actions intended to improve conditions until the performance threshold has been met.

The goals, objectives, and thresholds of the Monitoring Plan are:

Goal 1. Maintain groundwater at or above predicted levels beneath Edmond Marsh and Sequalitchew Creek.

> **Objective 1A**. Groundwater levels at monitoring wells near Edmond Marsh and Sequalitchew Creek are at or above predicted levels.
>
> **Performance Threshold**: Monthly groundwater level measurements are at or above target levels established for each step of the dewatering process at each well and for each month of the year, based on statistical analysis of groundwater model predictions over a range of historical climate conditions. Initial target levels are included in Tables 4, 6, 8, and 10.

Goal 2. Maintain groundwater conditions conducive to safe and efficient mining and processing of the South Parcel aggregates.

> **Objective 2A**. Moisture content of mined aggregate is at appropriately low levels for safe and efficient mining and processing.

3 Dewatering Plan Overview

The entire mining process will take many years and is designed to proceed slowly from areas of least potential impact toward areas of increasing potential impact, allowing time and opportunity to confirm predictions and adaptively manage the mining and dewatering effort before irreversible changes occur.

Mining of the South Parcel will proceed slowly from the north to the south over a period of 5 to 8 years, extracting gravel to create a broad trough along the eastern property boundary. Wells will be installed and pumped in advance of mining to intercept groundwater and dry out the gravels for mining. The purpose of mining a trough is to minimize the amount of time that active dewatering by pumping wells is required. Once mining of each section of trough is completed, the adjacent wells can be turned off, allowing groundwater to passively seep from the stable mine slope and flow by gravity to an infiltration facility on floor of the existing mine. After mining the trough along the perimeter, gravel will be extracted from the interior area.

The following section describes four steps of the dewatering plan, but it is important to recognize that these steps occur on very different time scales. Figure 2 provides an overview of the timeline for the four steps of dewatering, assuming that mining proceeds rapidly during the period of active dewatering (Step 3).

The initial step is a 60-day pumping test that is completely reversible (i.e., no gravel will be extracted during the test). The results of that test will be analyzed and evaluated, and plans adjusted as necessary prior to commencing the next phase.

The second step involves installing and pumping additional dewatering wells to lower water levels in the first mine segment in preparation for mining. This step would last about six months and functions as a greatly expanded pumping test. As with the first step, it is also completely reversible.

The third step—active dewatering during mining—involves mining the trough described above. Additional dewatering wells will be installed and pumped as mining progresses. Mining will begin at the location farthest from the Edmond Marsh and Sequalitchew Creek and proceed slowly south. Completing the trough would require 5 to 8 years depending on market conditions and the success in meeting predicted groundwater levels. The potential impact on groundwater levels builds slowly over time as wells are added and mining progresses south. This allows ample opportunity to monitor and adapt to the conditions observed before mining proceeds into each dewatered segment.

The final step—passive dewatering—begins when mining of the trough described above is complete and the last dewatering well is turned off. Passive dewatering represents the groundwater condition that will continue in perpetuity. Groundwater, no longer intercepted by wells, would form seeps at the toe of the eastern mine slope. It would flow by gravity through newly created wetlands and a vegetated swale to an infiltration pond located at the bottom of the existing mine. Once this step has begun, further mining activities in the interior of the South Parcel would not affect groundwater.

Additional detail about each of these steps is described in the following section.

3.1 Four Steps of Dewatering Plan

The dewatering necessary to accomplish the mine expansion will occur in four steps as outlined below to address the needs of the mining operations and to provide an opportunity for adaptive management, as described in Section 4. Figure 3 depicts locations of the wells planned for installation in each step. All water generated during dewatering will be infiltrated within the footprint of the current mine, west of the expansion area. Infiltrated water will travel vertically into the ground to the aquifer then flow westward and discharge as seeps to Puget Sound

Step 1. Initial Pumping Test: The first step is a 10-well pumping test, conducted for a minimum of 60 days, to validate model predictions of dewatering effectiveness in the local vicinity of the test wells and make any necessary changes to the model parameters and/or plans for subsequent dewatering and mining activities. The 10 wells will be located in the northeastern portion of the South Parcel as shown on Figure 3. Monitoring will be conducted throughout the test in the pumping wells and existing monitoring wells. The combined pumping rate during Step 1 is predicted to be approximately 3.5 cubic feet per second (cfs) on average, and up to approximately 5 cfs if pumping during the wet season. The model predicts that groundwater level changes will stabilize within approximately 60 days of the start of pumping. No mining will occur in the South Parcel during this step. Step 1 could occur at any time prior to mining; it is not anticipated that all permits for mining would need to be obtained before Step 1 could occur.

Step 2. Preparation for Mining/ Dewatering Test: Following completion of the initial pumping test, the next step of the dewatering plan involves expanding the dewatering well network along the eastern edge of the mine area with two purposes: 1) to evaluate model predictions across a wider extent (making any necessary changes to model parameters and/or to subsequent dewatering/mining activities); and 2) to dewater gravels for the first segment of mining. No mining will occur in the South Parcel before this step is completed.

During Step 2, an expected 14 additional dewatering wells will be installed along the South Parcel mine boundary, including wells located interior to the mine, as shown on Figure 3. The dewatering wells will be arranged in two lines on either side of the initial mine trough, including 19 boundary wells and 5 interior wells. Two additional monitoring wells will also be installed to measure drawdown within the mine interior. Step 2 is expected to last for up to 6 months,with the first two months being a second pumping test again lasting a minimum of 60 days, followed by an estimated four additional months of pumping to dry gravels in the Segment 1A in preparation for mining. The results from the first 60 days would be used to evaluate the model; this evaluation would occur concurrently with the continued dewatering in preparation for mining. The predicted total system pumping rate of approximately 5.1 cfs on average and up to approximately 8 cfs during the wet season.

Since a key component of Step 2 is preparation of the site for mining, pumping during Step 2 would only occur once mining and restoration permits have been obtained.

Step 3. Active Dewatering during Mining: Step 3 is active dewatering as mining begins to form a broad trough in the northeastern corner of the site. Over the next 5 to 8 years,

mining will then proceed from north to south along eastern boundary of site. Step 3 dewatering is predicted to use 66 dewatering wells arranged in two lines on either side of the initial mine trough, with 54 boundary wells and 12 inner wells, as shown on Figure 3. The wells are installed and pumped ahead of the trough's southern progression; as mining of an area is completed, wells along that portion of the trough are shut off, allowing groundwater to begin seeping from the newly mined slope. Groundwater seeping into the mine will be collected in a vegetated swale and conveyed to the infiltration pond located at the bottom of the existing mine.

If all 66 dewatering wells were operating, the combined pumping rate is predicted to be approximately 6.8 cfs on average and up to approximately 11 cfs during the wet season. However, it is unlikely that all dewatering wells would need to be operated at any one time as wells will be phased off as mining progresses.

Step 4. Cessation of Active Dewatering: During Step 4, pumping from the dewatering well network will cease, and the post-mining groundwater flow condition will be established consistent with reclamation objectives. Once all dewatering wells are off, mining above the water table will continue in the interior of the South Parcel. Groundwater will flow from the toe of the newly mined slope on the eastern boundary of the property and be collected and conveyed to an infiltration pond in the bottom of the existing mine, from where it will continue its westward flow, ultimately entering Puget Sound. Groundwater levels will increase slightly following the cessation of active dewatering as they adjust to long-term equilibrium with the new spring locations that will form along the toe of the mined slope. Step 4 lasts through mining of the remaining interior areas and through the post-mining period.

3.2 Dewatering Well Construction

The dewatering wells are designed to accommodate large drawdowns (up to 70 feet), and operate under a wide range of flow rates against a wide range of heads. All dewatering wells will be screened to the depth of the Olympia Beds, with nominal 10-foot sumps installed into the top of the Olympia Beds. Expected well depths will range from about 75 to 115 feet to accommodate the variation in aquifer thickness (between ground surface and the Olympia Beds contact) and the 10-foot sump into the Olympia Beds. The dewatering wells will be screened across the lower zone and a portion of the upper aquifer zone (generally 40- to 50-foot screen lengths). Continuous slot, v-wire wrapped stainless-steel well screens will be used for maximum dewatering efficiency (low head loss). Anticipated well flows range from approximately 400 gallons per minute (gpm) initially to an average of approximately 50 to 200 gpm to maintain drawdown once storage is depleted.

3.3 Predicted Effects of Dewatering on Groundwater Levels

The effects of the four-step dewatering plan on groundwater levels have been evaluated using a numerical, three-dimensional, groundwater model developed specifically for the project (DuPont model). The model is transient, meaning that it simulates changes in groundwater levels over time, and runs on a monthly time step for a roughly 12-year period from March 2004 to December 2015 that includes wet and dry climate conditions.

This allows the model to be used to analyze the effects of the proposed dewatering plan over a range of weather conditions.

The model was developed using data from 2004 to 2010 and calibrated to observed water levels at 19 wells. The calibrated model achieved a "good fit" with a mean residual (difference between predicted and observed) of 1.7 feet or about 6 percent of the difference in minimum and maximum groundwater levels at the calibration targets. The model was validated over 2004 to 2015 (after a change in the precipitation data source) and the validation statistics were similar to the calibration with a mean residual of 1.87 feet providing confidence in its use to simulate groundwater conditions. Additional detail on groundwater model development, calibration, validation and predictive results is available in the Groundwater Model Update (Aspect, 2017).

The DuPont model was used to predict changes in groundwater conditions during the four sequential steps of proposed dewatering and mining activity in the South Parcel. These predictive runs used the same weather and boundary conditions as model calibration with the only change being the addition of pumping wells and changes in surface topography with mining. Dewatering Steps 1, 2, and 3 simulated 10, 24, and 66 active dewatering wells, respectively. Step 4 simulated the post-mining condition with pumping terminated and groundwater passively discharging at the toe of the newly mined slope.

Results of the predictive models are discussed below by dewatering step, in terms of predicted changes in groundwater levels. Baseline groundwater levels are sensitive to seasonal and longer-term precipitation patterns, and the model indicates that groundwater levels during the four dewatering steps will likewise remain sensitive to precipitation patterns. Monitoring well locations are shown on Figure 4.

In Step 1, the changes in groundwater levels are most evident at the monitoring wells closest to the pumping test (CHMW-2S and CHMW-2D). The maximum groundwater level change at CHMW-2D is predicted to be approximately 9 feet, whereas minimal groundwater level change (less than 0.5 foot) is predicted at monitoring wells in Edmond Marsh (MW-EM-1D and MW-EM-2D).

During Step 2, the maximum change in groundwater level is approximately 45 feet and would occur at CHMW-2D located on the northeastern edge of the South Parcel and within the dewatering well network. The maximum groundwater level changes in the closest monitoring wells in Edmond Marsh (MW-EM-1D and MW-EM-2D) are predicted to be approximately 1.3 feet and 0.2 feet, respectively.

During Step 3, maximum groundwater level changes of up to about 60 feet are predicted at wells within the mine area. The maximum groundwater level changes at MW-EM-1D and MW-EM-2D (Edmond Marsh) are predicted to be approximately 5.2 feet and 0.4 feet, respectively. The groundwater levels during Step 3 are predicted to be approximately 10 to 20 feet above the Olympia Beds along the mine trough.

During Step 4, following cessation of active pumping, the maximum change in groundwater levels along the eastern slope of the mine ranges from about 14 to 49 feet. The maximum groundwater level changes at the closest Edmond Marsh Wells (MW-EM-1D and MW-EM-2D) are predicted to be approximately 5.0 feet and 0.4 feet,

respectively. A map of the predicted contours of groundwater drawdown after cessation of active pumping is shown on Figure 5. Solid drawdown contours on Figure 5 indicate areas of greater certainty closer to the monitoring well network and model calibration targets, dashed drawdown contours indicate areas of lesser certainty.

The groundwater model was used to develop performance thresholds for each well in each month during each dewatering step. The thresholds are based on the predicted range in water levels under seasonal and annual variation in climate. The performance thresholds were established at the lower 95th-percentile confidence interval for the predicted water levels.

As an example, Figure 6 provides the range of model predictions (groundwater elevation, and change from baseline water levels) over varying climate conditions for well CHMW-2D, located near the proposed location of the pumping test. The vertical lines in Figure 6 indicate the lower end of the predicted range. The bottom of the vertical line is the performance threshold. The performance threshold will change by well, by month (to account for annual seasonal patterns), and by dewatering steps. Similar figures have been prepared for each monitoring well and are presented in Appendix A.

4 Adaptive Management

This Monitoring Plan implements adaptive management to observe and respond to changes in groundwater levels occurring during mining of the South Parcel. This section first introduces the fundamental steps of effective adaptive management, then establishes key commitments by CalPortland to be met throughout the adaptive management process, and then walks through the detailed adaptive management plan, including the groundwater performance thresholds, for each dewatering step.

4.1 Process of Adaptive Management

Adaptive management has been described as "*a systematic process for continually improving management policies and practices by learning from the outcomes of operational programs"* (Nyberg, 1999). Adaptive management typically consists of a monitoring system to identify changes in the environment coupled with a response system to adjust the activities in response to monitoring results. The adaptive management system proposed for implementation on this project was developed as a combination of the systems proposed by Ralph and Poole (2003) and Nyberg (1999). It consists of five key sequential elements, as illustrated on Figure 7:

A. **Assess:** Information is compiled from monitoring data, geologic investigations, groundwater modeling, and other available sources. The compiled information is used to identify issues, refine objectives, and screen potential alternative approaches. Predictions of the potential effects of the action on groundwater levels are developed.

B. **Design:** Based on the results of the assessment stage, design of the proposed action proceeds. Design will result in a specific plan of action, and supporting evaluations to ensure that the anticipated results are consistent with the identified objectives, the Monitoring Plan, and prior environmental assessments. Predictions of groundwater levels are refined as the design evolves. Analyses conducted during the design stage could result in an iterative process of assessment and design. Any required permitting is also included in the design stage.

C. **Implement and Monitor:** The approved plan is put into action, concurrently with monitoring focused on key indicators tied to the identified objectives. Monitoring data indicating conditions worse than forecasted are acted on rapidly, moving into the evaluation and adjustment stages.

D. **Evaluate:** Monitoring data are evaluated relative to the objectives and forecasted results developed in the assessment and design stages. Differences between forecasts and results are identified and the causes for those differences investigated.

E. **Adjust:** Information learned in previous steps is used to adjust the actions, if necessary. The Monitoring Plan provides an initial identification of potential adjustments in each dewatering step, but additional adjustments could be developed to fit specific situations.

The adaptive management process is iterative and would repeat until the mining project is completed. If an adjustment is identified, the process would begin again from the assessment and design stages, followed by implementation of the adjustment and associated monitoring, then evaluation and further response (if necessary). If an adjustment is not necessary, then the process still repeats. In this case, the assessment and design stages would largely rely on the previously approved plans, but there is still potential for more minor refinements based on the information learned.

Throughout the adaptive management process, status updates, monitoring data, and final reports will be shared with the Environmental Caucus. Should groundwater levels not meet the performance thresholds established in this plan, then CalPortland would notify the Environmental Caucus and plan and implement adjustments. If adjustments are unsuccessful in meeting predicted groundwater levels, CalPortland and the Environmental Caucus would initiate a technical review conference and, if necessary, meet and confer to share information and determine the appropriate additional steps.

4.2 Key Adaptive Management Commitments

This section establishes the commitments related to key components of adaptive management. First, an overview of the anticipated schedule for the four dewatering steps is presented. Then the commitments to the frequency that groundwater levels will be compared with the performance thresholds is established, followed by a summary of the notifications that will be provided if certain events occur (such as starting to pump new wells, or measurements of groundwater levels that are below performance thresholds). The next section summarizes the reports that will be provide throughout the process, ranging from relatively simple progress updates to detailed reports on the pumping tests. Then several overall limitations on advancement of mining and dewatering are established. Finally, the meet and confer process for resolving disputes is defined.

Additional detail about the adaptive management process as it applies to each dewatering Step is presented in Section 4.3.

4.2.1 Anticipated Schedule

Mining of the South Parcel will occur over many years, and the anticipated project schedule has been designed to include sufficient time for the adaptive management process to succeed in meeting performance thresholds before mining or dewatering advances. An overview of the anticipated schedule is presented on Figure 8; additional schedule detail is presented in the detailed adaptive management plan for each Step presented in Section 4.3.

Mining and dewatering activities would not begin until a series of conditions identified in Section 4.3 of the 2011 Settlement Agreement have been met. Those conditions include: 1) environmental review (SEPA) has been completed; 2) permits for the Restoration Plan have been issued [including the required authorizations and approvals from Joint Base Lewis-McChord (JBLM) for restoration activities on JBLM property], and applicable appeal periods have expired (except for federal permits); and 3) all necessary permits and approvals for South Parcel mining have been obtained. This paragraph is intended as a summary only; to the extent that it is inconsistent with the Settlement Agreement, the Settlement Agreement shall govern.

Step 1 is anticipated to require a year to complete from initial planning through reporting and discussion of the results and any resulting adjustments to the dewatering plan. Planning and well installation for Step 2 would overlap with completion of the reporting and review components of Step 1. Once Step 1 has been completed, the pumping test component of Step 2 would begin.

Step 2 is anticipated to require 6 months of active pumping—the first 2 months would be a larger-scale pumping test, and dewatering would continue over the subsequent 4 months in preparation for the start of mining. Reporting and review of results would be performed while dewatering continues.

Step 3 would only commence when groundwater levels are above the performance thresholds and water levels are at appropriately low levels for safe and efficient mining and processing. If groundwater levels meet performance thresholds, Step 2 would flow into Step 3 and the start of mining. Otherwise, Step 2 may require a longer period to perform the necessary adjustments to achieve sufficient dewatering for mining while maintaining groundwater levels consistent with the performance thresholds and prior environmental analyses, or update the environmental analyses, if necessary.

Mining would proceed south over a period of multiple years. The actual rate of mining depends on market demand. CalPortland expects that mining the first four segments (1A through 1D) would take 4 to 8 years and has committed (see Section 4.2.5) to completing those four segments in no less than 3 years total, or a minimum of 9 months for each segment. Figure 8 shows the timeline for mining of the South Parcel in the unlikely event that mining were to progress at this accelerated pace and the first four segments were to be completed in three years.

Step 4 will begin after active dewatering ceases. Depending on market demand for aggregate products, mining of the remainder of the South Parcel is expected to occur over 5 to 8 years after cessation of active dewatering.

4.2.2 Comparison of Groundwater Levels with Performance Thresholds

Success of the dewatering plan is evaluated by comparing groundwater levels with the performance thresholds.

A summary of the monitoring events where comparisons with the predicted ranges will be performed is provided in Table 1. The frequency of these comparisons will vary over time with more frequent evaluations at the start of each dewatering step or when changes to dewatering are made. If any of these monitoring results indicate groundwater levels are not above the performance thresholds, CalPortland will notify the Environmental Caucus according to the timelines described in Section 4.2.3, which vary by dewatering Step, and begin the adjustment process.

Table 1. Frequency of Comparison to Performance Thresholds

Dewatering Step	Frequency of Comparison
Step 1 – Initial Pumping Test	Changing frequency during test: hourly -> daily -> weekly
Step 2 – Preparation for Mining/ Dewatering Test	Changing frequency during first 2 months/ pumping test: daily -> weekly, then Weekly at key wells, Twice monthly at all others
Step 3 – Active Dewatering during Mining	For 3 months when new wells start pumping: weekly at key wells and twice monthly at all others, then Monthly.
Step 4 – Cessation of Active Dewatering	Monthly

Note: Key wells are the monitoring wells in the South Parcel (CHMW-1 through 4) and the closest marsh monitoring stations (EM-1 and -2), including both shallow and deep wells at those locations.

4.2.3 Notifications

Notifications are intended to alert the Environmental Caucus to the occurrence of an event. Routine reporting, including project status updates, data summaries, pumping test analyses, are described in the next section (Section 4.2.4).

CalPortland will inform the designated representative of the Environmental Caucus of each of the following types of events:

1) At the start of each dewatering step;

2) Major milestones within each step (such as addition of new pumping wells);

3) Upon collection of monitoring data indicating actual groundwater levels are lower than the performance thresholds; and

4) Implementation of response actions.

The Environmental Caucus will provide timely notice of any changes in its attorney, consultant, or designated representative or their contact information.

Notification points in each of the dewatering steps are summarized in Table 2, except for routine reporting milestones (which are summarized in Table 3). Notifications will be provided in writing by email, letter, or memorandum/report, as appropriate for the nature of the notification. It is anticipated that most notifications will be provided by email.

Groundwater monitoring data (including raw data) would be provided within 2 days of any notification that monitoring results are below performance thresholds.

Table 2. Summary of Notifications by Dewatering Step

Dewatering Step	Events Triggering Notification of Environmental Caucus	Timeline for Notification
Step 1 – Initial Pumping Test	Updates to pumping test plan	Within 3 days of updating plan
	Installation of pumping test wells	1 week prior to start of drilling
	Start of pumping test	1 week prior to start of pumping
	Monitoring results below performance thresholds	Within 24 hours of measurement
	Any adjustments implemented during pumping test	Within 24 hours of change
	End of pumping test	Within 24 hours
Step 2 – Preparation for Mining/ Dewatering Test	Updates to dewatering plan based on Step 1 results	Within 3 days of updating plan
	Installation of Step 2 dewatering wells	1 week prior to start of drilling
	Start of dewatering	1 week prior to start of pumping
	Monitoring results below performance thresholds	Within 48 hours of measurement
	Any adjustments implemented during dewatering	Within 24 hours of change
Step 3 – Active Dewatering during Mining	Commencement of mining in the South Parcel	1 month prior to start of mining
	Initiation of pumping at new wells	1 week prior to start of pumping
	Monitoring results below performance thresholds	Within 3 days of measurement
	Any adjustments implemented during dewatering	Within 3 days of change
	Cessation of active dewatering	Within 1 week of ceasing dewatering
Step 4 – Cessation of Active Dewatering	Monitoring results below predicted values	Within 3 days of measurement
	Completion of mining in South Parcel	Within 1 month of completion

The timeline for notification that monitoring results are below performance thresholds increases from 24 hours in Step 1 to 48 hours in Step 2 to 3 days in Steps 3 and 4 for four reasons:

1) the rate of change in groundwater levels will slow as mining progresses;

2) confidence increases over time as the number of wells pumping and set of successful groundwater measurements grows (mining and dewatering only advance when performance thresholds are met; see Section 4.2.5 for the specific limitations);

3) new wells begin pumping substantially in advance of mining both in time and space and dewatering proceeds from farthest away towards the creek and

marshes, which allows for the marginal impact of adding new wells to be reversible, even in during Step 3; and

4) Gravel would continue to be mined, but the volume that could be mined during the notification period is nominal compared with the volume of each mine segment, which are expected to require 1.5 to 2 years of mining to complete.

4.2.4 Routine Reporting

CalPortland will routinely share information about mining, dewatering, and the adaptive management process with the Environmental Caucus to achieve a variety of purposes, including sharing and interpreting monitoring data, documenting actions taken during a dewatering step, providing updated model predictions and analysis, and response actions, if necessary.

The specific reports required during each step of dewatering are summarized in Table 3. Additional detail about the individual reports and their role in the adaptive management process is presented in the Detailed Adaptive Management Plan in Section 4.3.

Table 3. Summary of Reporting by Dewatering Step

Dewatering Step	Reports	Minimum Frequency of Reporting
Step 1 – Initial Pumping Test	Pumping Test Design	One time
	Pumping Test Progress	Weekly during test
	Pumping Test Results	One time
Step 2 – Preparation for Mining/ Dewatering Test	Dewatering Plan for Step 2, if revised.	One time
	Pumping Test Progress	Weekly for first 2 months
	Pumping Test Results	One time – 4 months after start of Step 2
	Dewatering Summary Memos	Monthly
Step 3 – Active Dewatering during Mining	Dewatering Plan, Mining Plan, or SAP, if revised.	One time
	Dewatering Summary Memos,	Monthly for 3 months after each new set of dewatering wells, then quarterly
Step 4 – Cessation of Active Dewatering	Dewatering Summary Memos for first year	Quarterly for 2 years, then annually

The purpose and contents of each report are outlined below:

- Pumping Test Design/Dewatering Plans will provide the plan for performing the pumping tests and/or dewatering. These plans will include the proposed well pumping and observation well locations, depths, well construction, drilling methods, data collection, and timelines.

- Pumping Test Progress will provide a status update during the pumping test including an overview of progress toward completing the test, identifying which wells are pumping and pumping rates, locations and frequency of monitoring, any changes to the pumping test plan, and notes on how the test is proceeding.

- Pumping Test Results will present a detailed reporting of the execution of the pumping test, a summary of the data collected, including figures showing groundwater levels and pumping rates over time, comparisons of groundwater levels with performance thresholds, data analysis and results (estimates of key hydrogeologic parameters), and a comparison between model predictions and pumping test results for the purpose of model evaluation and validation.

- Dewatering Summary Memos will provide a summary of mining and dewatering progress, including information on any new wells installed, initiation of pumping at new wells, overview of wells that are pumping and pumping rates, cessation of pumping at wells, areas of active mining, and reclamation activities.

Reports will be prepared by a third-party consultant to be selected and paid for by CalPortland. The reports will be distributed to the Environmental Caucus electronically in protected documents, with hard copies available on request. Raw monitoring data will be provided with any groundwater measurement below a performance threshold, or when requested by the Environmental Caucus.

4.2.5 Limitations on Mining

In order to establish bounds on the pace and advancement of mining that will allow time for the adaptive management process to succeed, CalPortland commits to the following limitations on mining and dewatering activities in the South Parcel:

1) Mining associated with active dewatering (i.e., mining of the trough along the eastern boundary of the South Parcel; Figure 3) will last at least 3 years.

2) The mine trough has been divided into four segments (1A to 1D; Figure 3). Mining of each segment will last at least 9 months.

3) Mining will not advance into the next segment, unless groundwater levels meet performance thresholds.

4) Dewatering activity will not intensify through commencing pumping at new wells or increasing pumping rates at existing wells (except for normal seasonal changes in pumping rates), unless groundwater levels meet performance thresholds.

These limitations do not apply to operations of the existing mine and processing area, or extraction of gravel from areas west of the Olympia Bed truncation within the existing mine or North Parcel as these areas do not require dewatering.

4.2.6 Meet and Confer Process

Section 7.3 of the Settlement Agreement states that the Monitoring Plan will include a "process for the Parties to meet and confer if the groundwater levels do not meet the criteria provided in the Monitoring Plan." The process described below involves two steps for the parties (CalPortland and the Environmental Caucus) to follow with respect to groundwater information and data obtained during the monitoring process. The first step is for the parties' technical consultants to engage in one or more technical review conferences. If necessary, the second step would involve one or more meetings between the parties' designated representatives to discuss any differences of opinion or interpretation that the technical consultants are unable to resolve. Each of these two steps is discussed further below. This two-step process may be invoked at any time, including but not limited to the various specific points in the adaptive management process identified in Section 4.3 below.

Technical Review Conferences. The Environmental Caucus may initiate a request for a technical review conference of the parties' technical consultants at any time to discuss any questions or concerns it might have about any aspect of the groundwater monitoring data. The conferences may be in person or via conference call or other communications technology, and there may be multiple conferences to discuss any issues identified by the Environmental Caucus. The technical consultants would work in good faith during these review conferences to resolve any differences in interpretation of the groundwater monitoring data.

Party Representative Discussions. If the good-faith efforts of the technical consultants are unable to resolve any differences of opinion regarding the interpretation of the groundwater data, including but not limited to what the data shows regarding groundwater levels, either CalPortland or the Environmental Caucus may request a meeting of the parties' designated representatives or principals by providing notice to the other party of the desire to meet, and a brief explanation of the reasons for the request.

Once noticed is provided, CalPortland and the Environmental Caucus would work collaboratively to agree on a meeting format, date, time, and place to be held within 30 days of the request to hold a Technical Review Conference or a Party Representative Discussion. Meetings may be in person or via conference call or other communications technology, and there may be multiple meetings. This paragraph is intended to generally describe, but not constrain, the ways that the parties may choose to meet. Based on the issue raised, CalPortland would prepare and provide appropriate information summarizing the issue and current status of mining and dewatering activities, sharing related monitoring data (including raw data, if requested), and identifying potential responses.

Representatives of CalPortland and the Environmental Caucus will confer during the meeting on the most appropriate response with the goal of reaching consensus. If consensus cannot be reached, the parties would enter mediation, making good-faith efforts to hold a meeting with a mutually agreed-upon mediator within 45 days of the initiation of any request to the other party for mediation.

4.3 Detailed Adaptive Management Plan

This section is the core of the Monitoring Plan. It walks through each step of the dewatering plan providing conceptual details about how the stages of adaptive management would apply to that step. Specifically, this section establishes the objectives, provides an overview of monitoring activities, outlines an approximate schedule, summarizes the approach for data evaluation, and provides initial identification of potential response actions for each step of the dewatering plan.

Specific details of the monitoring activities (e.g., monitoring locations, frequency, and methods) are provided in the SAP in Appendix B.

Although the stages of adaptive management are presented sequentially in each step, it is important to recognize that the adaptive management process will be implemented iteratively within the step, particularly for Steps 2 and 3. For example, evaluation will be conducted each time monitoring data is collected, and that evaluation could trigger adjustment and looping back through the process during the same dewatering step. Alternately, if the monitoring data consistently indicate that performance thresholds are being met, the adaptive management process for a step could be completed without requiring iteration or adjustments.

4.3.1 Step 1 – Initial Pumping Test

Step 1 is envisioned as a 10-well pumping test, conducted for a minimum of 60 days, to validate model predictions of dewatering effectiveness in the local vicinity of the test wells, and make any necessary changes to the model parameters and/or to plans for subsequent dewatering and mining activities. No mining will occur in the South Parcel during Step 1.

The adaptive management process in Step 1 is illustrated on Figure 9.

A. Assess

The assessment stage for Step 1 will include compilation of existing monitoring data, geologic information, results from prior pumping tests conducted by CH2M Hill (2000), and the latest groundwater modeling simulations of the Step 1 pumping test. Monitoring data will continue to be collected and will be incorporated into the assessment for the pumping test.

Two initial objectives have been identified for the Step 1 pumping test:

1) Evaluate model predictions near the test wells.

2) Test dewatering design for meeting mining needs (i.e., achieving necessary drawdown), collecting information to refine the dewatering design, such as the number, screening, and spacing of wells.

B. Design

Based on the information collected during the assessment phase, CalPortland, and its consultants, will prepare a detailed plan for the pumping test. The plan will identify the number and location of pumping and observation wells, well drilling and construction, pumping rates, duration, monitoring locations, equipment, and frequency, etc.

The pumping test plan will be provided to the Environmental Caucus.

C. Implement and Monitor

CalPortland will install the pumping wells and any new observation wells, and conduct the pumping test. The minimum duration of pumping during the test will be 60 days.

Monitoring would consist of two components: 1) high-frequency automated monitoring at wells that are expected to be affected by the pumping test and at sensitive receptors, and 2) continuation of routine manual monitoring at other groundwater and surface water locations.

High-frequency monitoring using pressure transducers would be performed in observation wells near the pumping test location (CHMW-2D, -2S, and MW-D-3), and at wells located nearest to Sequalitchew Creek and West Edmond Marsh (CHMW-3S &-3D and MW-EM-1D). Typically, the frequency of data collection is programmed to vary throughout a pumping test with rapid data collection at the start tapering to less frequent as groundwater levels near stabilization.

Routine monitoring would continue to occur at the normal monitoring locations, including wetland, stream, and groundwater locations outside the area of influence of the pumping test. The streamflow monitoring stations are continuously recording. Manual measurements will be used at the wetland and groundwater locations not near the pumping test.

The Environmental Caucus will be notified of the installation of wells and the start and end of the pumping test. CalPortland will also provide weekly summaries of pumping test progress, and notification (within 24 hours) of any monitoring results below the performance thresholds. Routine reporting is summarized in Table 3 and notifications are outlined in Table 2.

D. Evaluate

Data will be screened as they are collected to determine if immediate action is required. In such an event, the Environmental Caucus would be notified within 24 hours, and the project would move immediately to the adjustment stage.

As monitoring data are collected, they also will be evaluated to see if the test is well-designed and the monitoring network is effective. If necessary, the project may enter the adjustment step to improve the pumping test to collect better information.

Once representative monitoring results are being collected, they will be screened against performance thresholds in Table 4 for the appropriate well and month. The performance thresholds were established at the lower 95th-percentile confidence interval for the predicted water levels [see Section 3.3 and the Groundwater Model Update (Aspect, 2017)]. The frequency of screening will vary during the test beginning with hourly at the start and reducing to daily then weekly as the test progresses, as outlined in Table 1.

If the monitoring results indicate that groundwater levels near the marshes are lower than the performance thresholds, CalPortland would develop and implement appropriate adjustments during the pumping test.

If monitoring results indicate groundwater levels are lower than the performance thresholds in wells that are not near the marshes or other sensitive receptors (i.e., monitoring wells on the South Parcel), then the test would be completed as planned. These results would be evaluated and any anticipated adjustments for future steps identified.

Even if the observations made during the test are above the performance thresholds, they still may provide valuable information for refining the model, mine plan, and Monitoring Plan. Those observations will be considered during assessment and design for Step 2.

The evaluation will also include comparison of climate and water level conditions prior to the test with the range of conditions experienced during the model calibration and validation period.

E. Adjust

Adjustments during the pumping test could occur for two reasons:

1) The monitoring data indicate that data collected are not sufficient to achieve the objectives of the test; or

2) The monitoring data indicate that groundwater levels are below the performance thresholds.

Potential adjustments consist of modifying or terminating the pumping test, and are listed in Table 5. Since no mining below the pre-project groundwater elevation would occur during this dewatering step, any change in groundwater could be reversed by turning the dewatering wells off.

Table 5. Potential Response Actions during Step 1 – Initial Pumping Test

Modify pumping test:
Changing pumping rates
Changing the number of pumping wells
Changing the duration of pumping
Changing monitoring locations including installing new wells
Performing additional testing
Cease pumping test.

CalPortland will notify the Environmental Caucus of any adjustments to the pumping test within 24 hours of the change.

Reporting and Discussion

At the conclusion of the Step 1 pumping test, whether completed as planned, adjusted, or terminated, CalPortland will prepare an interpretative report documenting the pumping test, summarizing the monitoring data, comparing monitoring results with prior model predictions, and making recommendations for the assessment and design phases of the next step.

The report will be provided to the Environmental Caucus, with a 3-month period for review and discussion of the results. CalPortland commits to meeting with the Caucus as often as necessary during the review period to facilitate open communications and timely review. Should the Environmental Caucus and CalPortland have different interpretations

of the dewatering test results, either party may request technical review conferences of the parties' technical consultants, followed by, if necessary, meetings of the parties' representatives, as described in Section 4.2.6 above.

Anticipated Schedule
The schedule for Step 1, in the context of the overall mining schedule, is illustrated in Figure 8. It is expected to require about a year to complete Step 1, with the following anticipated schedule:

- Planning the Pumping Test 1 month
- Installing and Developing Wells 2–3 months
- Performing the Pumping Test 2 months
- Evaluating Results and Reporting 2 months
- Model Updates (if necessary) 2–3 months
- Review by and discussion with Environmental Caucus 3 months

Incorporation of the results into the design of future steps could require additional time.

4.3.2 Step 2 – Preparation for Mining/ Dewatering Test

In Step 2, additional dewatering wells will be installed and will be pumped for several months to draw down groundwater until the gravel in the first mine segment of the South Parcel is dry enough to mine. If monitoring results are above performance thresholds during Step 2, the intent is to continue dewatering from those wells and transition smoothly into Step 3 – Active Dewatering during Mining. Step 3 would only commence when groundwater levels are above the performance thresholds.

The dewatering activity will also serve as a greatly expanded pumping test, the effects of which are completely reversible. The information collected in the first 60 days is most valuable as a pumping test, so evaluation and reporting on the test will focus on this period. The pumping test portion of Step 2 will occur for a minimum of 60 days.

The adaptive management plan for Step 2 is illustrated on Figure 10.

A. Assess
The planning for Step 2 will incorporate the results of Step 1, including any updates to the groundwater model, this Monitoring Plan, or mine plan resulting from Step 1.

In the assessment phase for Step 2, the results of the pumping test in Step 1 will be compared with the groundwater model. If they agree, then design would move forward as planned. If there are notable differences, the groundwater model would be evaluated and potentially modified.

The first level of model evaluation and modification would consist of updating the model to reflect the specific conditions of the Step 1 test (well locations, well construction, pumping rates, antecedent weather conditions, etc.) and developing a set of model predictions specific to the actual test conditions. These updates only modify the scenario for Step 1 and would not require recalibration of the model.

If the predictions from the updated model are notably inconsistent with the results of the pumping test, then the model parameters would be modified and calibrated to the observed data. Then, the full suite of predictive scenarios would be evaluated and compared with the groundwater levels included in the environmental analyses and permitting. If within the contemplated range, the project would move forward to the design phase with the revised model. If not, additional environmental analysis may be necessary.

The initially identified objectives for Step 2 are:

1) Evaluate whether groundwater levels at monitoring wells are above the performance thresholds; and,

2) Confirm that groundwater levels are low enough within the material to be mined to allow for safe and efficient mining and processing.

B. Design

Based on the results of the assessment step, the dewatering plan for Step 2 and the associated monitoring will be designed by CalPortland. Updates to the design will be simulated with the groundwater model and compared with prior environmental analyses as described above. If the model was updated in Step 1 or the assessment stage of Step 2, the predictive results from the updated model will be used to establish new performance thresholds.

Updates to the design and predictions of its impacts on groundwater will be provided to the Environmental Caucus.

C. Implement and Monitor

The additional dewatering wells for Step 2 will be installed and begin pumping. Pumped water will be discharged to an infiltration facility on the floor of existing mine. Pumping will occur for a minimum of 60 days to complete the dewatering test plus an estimated four additional months to dry gravels in Segment 1A sufficiently for mining.

Monitoring would consist of weekly monitoring at the key wells on the South Parcel in the portions of Edmond Marsh closest to the mine (key wells are defined in Table 1) and twice monthly monitoring at the other well, staff gage, and flow monitoring stations. Stations with continuously recording instrumentation, such as the flow monitoring stations, will be downloaded during these visits. Pressure transducers would also be installed to allow for continuous monitoring in key monitoring wells. Manual measurements will be collected from the other locations, such as staff gages and more distant wells.

The Environmental Caucus will be notified of the installation of wells and the start of dewatering. CalPortland will also provide weekly summaries of dewatering progress during the first two months, then monthly summaries. CalPortland will notify the Environmental Caucus (within 24 hours) of any monitoring results below the performance thresholds. Routine reporting is summarized in Table 3 and notifications are outlined in Table 2.

D. Evaluate

The evaluation stage in Step 2 is very similar to the evaluation stage of Step 1, as both actions are essentially pumping tests at different spatial scales.

Data will be screened as they are collected to determine if immediate action is required. In such an event, the Environmental Caucus would be notified and the project would move immediately to the adjustment stage.

Monitoring results will be screened against the performance thresholds in Table 6 for the appropriate well and month. The performance thresholds were established at the lower 95th-percentile confidence interval for the predicted water levels [see Section 3.3 and the Groundwater Model Update (Aspect, 2017)]. If the monitoring results indicate that groundwater levels are lower than the performance thresholds, CalPortland will develop and implement appropriate adjustments.

Even if the groundwater levels are above the performance thresholds, they still may provide valuable information for refining the model, mine plan, and/or this Monitoring Plan. Those observations will be considered during assessment and design for the next dewatering step.

The evaluation will also consider the effect of conditions occurring at the time of monitoring (such as climate conditions, development, and Restoration Plan activities) with the range of conditions experienced during the model calibration and validation period, and include that information in the interpretation of results.

E. Adjust

Adjustment during the pumping test could occur for two reasons:

1) The monitoring data indicate that dewatering could cause groundwater drawdown beyond that previously contemplated and permitted; or

2) The monitoring data indicate that groundwater levels are not sufficiently low within the mine to allow for safe and efficient mining and processing in Step 3.

The first case would trigger rapid development and implementation of adjustments by CalPortland. If adjustments are not feasible or are exhausted without success, CalPortland would request to initiate the technical review conference of the parties' technical consultants, followed by, if necessary, meetings of the parties' representatives, as described in Section 4.2.6. The Environmental Caucus may also initiate this process.

In the second case, CalPortland would refine the dewatering plan while pumping continues. Potential adjustments include modifying or terminating the pumping test, and are listed in additional detail in Table 7. The list of adjustments provided in Table 7 is not intended to limit the range of potential responses.

CalPortland will notify the Environmental Caucus of any adjustments within 24 hours of the change.

Step 2 is completely reversible as no mining below the pre-project groundwater elevation would occur. Any change in groundwater could be reversed by ceasing to pump from the dewatering wells.

Table 7. Potential Response Actions during Step 2 – Preparation for Mining/Dewatering Test

Revise monitoring (change frequency of monitoring, or monitoring locations).
Install additional monitoring locations.
Change pumping rates.
Change pumping locations (adding or decommissioning) wells.
Modify the duration of pumping.
Cease dewatering.

Reporting and Discussion

In addition to the dewatering summaries described above, an interpretative report will be prepared in the third month of pumping for Step 2. The report will summarize the pumping-test portion of Step 2 by summarizing the first 2 months of data, comparing monitoring results with prior model predictions, documenting any response actions taken, and making recommendations for the assessment and design phases of the next step.

The report will be provided to the Environmental Caucus, with a 2-month period for review and discussion of the results. CalPortland commits to making its technical consultant available to meet with the Caucus's technical consultant as often as necessary during the review period to facilitate open communications and timely review. Should the parties' technical consultants be unable to resolve any difference in opinion in interpreting the dewatering test results, either party may request a meeting of the parties' designated representatives, as described in Section 4.2.6 above.

Anticipated Schedule

Step 2 is expected to require a about a year to complete, though the planning and well installation stages may overlap with the later reporting and discussions related to Step 1. The schedule for Step 2 and relationship with the Step 1 pumping test are shown on Figure 8. The anticipated schedule for key elements of Step 2, assuming performance thresholds are met, is:

Planning the Dewatering	2 months	
Installing and Developing Wells	2–3 months	
Performing the Pumping Test	2 months	
Evaluating Results and Reporting	2 month	Simultaneously: Continue Dewatering in Preparation for Mining
Update Model (if necessary)	1 month	
Review by and discussion with EC	2 months	4 months

If groundwater levels meet performance thresholds, Step 2 would flow into Step 3 and the start of mining. Otherwise, Step 2 may require a longer period to perform the

necessary adjustments to achieve sufficient dewatering for mining while maintaining groundwater levels consistent with the performance thresholds and prior environmental analyses, or update the environmental analyses, if necessary.

Step 3 would only commence when groundwater levels are above the performance thresholds and water levels are at appropriately low levels for safe and efficient mining and processing.

4.3.3 Step 3 – Active Dewatering during Mining

During Step 3, mining will begin in the northeastern portion of the South Parcel and proceed south to mine a trough along the eastern boundary. Additional dewatering wells will be installed and pumped to dewater gravel in subsequent mine segments in the South Parcel. CalPortland would not start pumping additional dewatering wells until groundwater levels are at or above performance thresholds.

As mining is completed, reclamation of the eastern mined slope will begin. Pumping wells adjacent to mine segments that are under reclamation will be turned off incrementally to allow natural springs to form at the toe of the mined slope and vegetation to become established.

Steps 3 and 4 are different from the first two steps in that changes to groundwater in these steps are not as easily reversed. As such, the adaptive management plan is focused on identifying when adjustments are necessary.

The adaptive management plan for Step 3 is iterative, and activities would loop continuously through the adaptive management stages throughout implementation of Step 3. The adaptive management plan for Step 3 is illustrated on Figure 11.

A. Assess

The planning for Step 3 will begin prior to the completion of Step 2 to allow for a potentially smooth transition, if performance thresholds are being met. The planning stage will incorporate previously collected monitoring data as well as any updates to the groundwater model, monitoring plan, or dewatering and mining plans.

If monitoring data from prior steps meet the performance thresholds, the planning for Step 3 is expected to move forward in accordance with the mine plan.

Differences between monitoring results and predictions would result in re-evaluation of the groundwater model. The re-evaluation would first simulate the specific conditions of Step 2, then more broadly update the model if predictions still do not match observations. If significant model updates are required, the full suite of scenarios would be simulated and results compared with the prior environmental analyses and permitting. Only if model results are within the predicted range may the project move forward to the design phase with the revised model.

The initially identified objectives for Step 3 are:

1) Evaluate whether groundwater levels at monitoring wells are above the performance thresholds for the appropriate month; and

2) Confirm that groundwater levels are low enough within the material to be mined to allow for safe and efficient mining and processing.

B. Design

Based on the results of the prior steps and assessment for Step 3, the dewatering plan, mining plan, and the associated monitoring will be updated by CalPortland, if necessary. Updates to the design will be simulated with the groundwater model and compared with the performance thresholds. Updated documents will be provided to the Environmental Caucus.

C. Implement and Monitor

Mining will begin at the northern edge of the South Parcel in the area dewatered in Step 2. As mining progresses, additional dewatering wells will be installed to the south of the current wells and begin pumping. As mining is completed in an area, the nearby wells will be turned off, allowing groundwater to emerge from springs from the toe of the completed slope. Both pumped groundwater and spring flow will be conveyed to an infiltration pond installed on the floor of the existing mine.

Monitoring would continue at all normal well, wetland, and streamflow monitoring stations. Streamflow and select well monitoring stations would have continuous recording instruments installed. Other locations would use manual measurements.

The frequency of monitoring would vary during Step 3. In the 3 months after the start of pumping for each new group of monitoring wells, monitoring would be weekly at key wells (defined in Table 1) and twice monthly monitoring at the other well, staff gage, and flow monitoring stations. After that, monitoring will be performed monthly.

D. Evaluate

As with prior steps, monitoring results will be screened against performance thresholds for Step 3 (Table 8) for the appropriate well and month. The performance thresholds were established at the lower 95th-percentile confidence interval for the predicted water levels [see Section 3.3 and the Groundwater Model Update (Aspect, 2017)]. If the model was previously updated, performance thresholds based on predictive results from the updated model will be used for the comparison. The evaluation will also consider the effect of conditions occurring at the time of monitoring (such as climate conditions, development, and Restoration Plan activities) with the range of conditions experienced during the baseline period.

If the monitoring results indicate that groundwater levels are lower than the performance thresholds, CalPortland would evaluate and implement appropriate adjustments.

Although the primary focus is on changes in groundwater levels, streamflow and surface water monitoring results will also be reviewed. By this point in the project, streamflow and surface water monitoring results will be affected by Restoration Plan activities, which are likely to have a larger effect than mining on the surface water bodies. The Restoration Plan will incorporate its own adaptive management process.

E. Adjust

Step 3 involves mining below the current aquifer level. As such, it is more difficult to reverse than prior steps; however, mining is designed to begin away from the marshes

and Sequalitchew Creek and proceed southward toward them over a period of years. This will slowly change water levels beneath the marshes and creek and allow time for response actions should the monitoring data and evaluations indicate they are necessary.

If groundwater levels are below the performance thresholds, CalPortland would develop and implement adjustments. Unlike in the prior steps, re-examination of the groundwater model is not a first element of evaluating potential response actions in Step 3.

Either party may initiate a request for a technical review conference and, if necessary, meetings of the parties' representatives, as described under Section 4.2.6 above. If adjustments are not feasible or are exhausted without meeting performance thresholds, CalPortland would initiate the process to discuss alternative approaches and next steps.

Selection of potential response actions is shown in Table 9. The suite of appropriate response actions will change over time as mining progresses. For example, early in Step 3 there is more flexibility to alter the mine plan. As mining progresses further south, the ability for alterations to the mine plan to produce a meaningful change in groundwater levels is reduced.

Table 9. Potential Response Actions during Step 3 – Active Dewatering during Mining

Revise mine phasing to allow time for additional monitoring, analyses, testing, and planning.
Revise dewatering plan (number of wells, spacing, alignment, pumping duration).
Revise mining plan to change depth or extent of mining.
Install partial slurry cutoff wall.
Provide additional mitigation.
Cease dewatering and mining.

Reporting and Discussion

During Step 3, CalPortland will prepare summary memos providing comparison of observed groundwater levels over the past 3 months with model predictions, as well as an update on dewatering and mining status, and any response actions taken. The summary memos will be prepared monthly for 3 months after each new set of dewatering wells begins pumping, then quarterly. The memos will be provided to the Environmental Caucus.

Anticipated Schedule

Mining would proceed south over a period of years. Completion of Step 3 is expected to take 4 to 8 years. The mining schedule is, in part, driven by the market demand for aggregate. CalPortland has committed to complete Step 3 in no less than 3 years, or a minimum of 9 months per each of the first four segments (1A to 1D). The minimum timeline for completion of Step 3 is illustrated in Figure 8.

4.3.4 Step 4 – Cessation of Active Dewatering

This final step of dewatering commences once mining and reclamation advances to the point that the last dewatering wells installed in Step 3 have been turned off. At that point, groundwater will emerge from springs along the length of the toe of the mined (and reclaimed) slope along the eastern and a portion of the southern mine boundaries. Step 3 is expected to transition smoothly into Step 4, given the multiple-year duration of Step 3 and that ceasing to pump the dewatering wells will result in lower environmental impact.

Several steps of the adaptive management process (i.e., assess and design) are not as relevant in Step 4, because it is a largely passive step with respect to the effects on groundwater levels. Mining and reclamation activities will continue within the South Parcel, but those activities would no longer influence groundwater levels.

As such, this discussion focuses on ongoing monitoring, data evaluation, and potential response actions. The adaptive management plan for Step 4 is illustrated on Figure 12.

C. Monitoring

Monthly monitoring would continue for the duration of mining at the normal well, wetland, and streamflow monitoring stations. Continuous instrumentation will be maintained at streamflow monitoring stations. Staff gage and well monitoring locations will be manually measured.

D. Evaluate

Monitoring results would continue to be screened relative to the performance thresholds shown in Table 10, or as refined from the most recent groundwater model. The performance thresholds were established at the lower 95th-percentile confidence interval for the predicted water levels [see Section 3.3 and the Groundwater Model Update (Aspect, 2017)]. It is unlikely that events will result in short-term changes in groundwater levels in Step 4. Therefore, the evaluation will focus on longer-term comparisons with model predictions and observations of changes in the marshes and Sequalitchew Creek.

E. Adjust

If groundwater levels persist lower than the performance thresholds, CalPortland and the Environmental Caucus would hold one or more technical review conferences of the parties' technical consultants and, if necessary, meetings of the parties' representatives (as described in Section 4.2.6). to discuss and select appropriate adjustments. Either party may initiate this process.

Reporting

Quarterly summary memos will be prepared for the first year after cessation of dewatering. Annual reports will be prepared for the remaining duration of mining of the South Parcel.

Anticipated Schedule

Step 4 will begin after active dewatering ceases. Depending on market demand for aggregate products, mining of the remainder of the South Parcel is expected to occur over 5 to 8 years after cessation of active dewatering. Active adaptive management during Step 4 would cease when the following conditions are met:

- Mining of the South Parcel is complete, and

- Measured groundwater levels have been met performance thresholds for at least 3 consecutive years.

5 Relationship of Adaptive Management Process to Sequalitchew Creek Restoration Plan

Mining of the South Parcel and the restoration of Sequalitchew Creek are separate, but interacting, projects. Each project has its own adaptive management process tailored to achieving the goals and objectives of that project. The interaction between the two adaptive management processes is three-fold: 1) project schedules that encourage restoration in advance of the potential impacts from mining; 2) development of performance thresholds for mining that support restoration based on prior technical studies, including the cumulative effects analysis prepared in 2016 (Aspect and Anchor, 2016); and 3) coordinated monitoring and open sharing of information.

Project Schedules. The mining and restoration projects have been designed to facilitate restoration occurring in advance of the potential impacts from mining. This relationship between the project schedules is founded in key elements of the settlement agreement:

1) The mining project cannot begin until all permits for restoration have been obtained and the required authorizations or approvals from JBLM needed to implement the restoration elements on JBLM have been obtained.

2) The first actions of the mining project are pumping and dewatering tests (i.e., Steps 1 and 2) and are expected to take about 1.5 to 2 years to complete and no less than 9 months[1], as described in Section 4.2.1. The effects of Steps 1 and 2 on groundwater are completely reversible.

3) The first South Parcel mining segment is located furthest from the wetlands and Sequalitchew Creek. Mining and dewatering proceed slowly toward the Creek over a period of not less than 3 years, and more likely 4 to 8 years.

4) There are no schedule constraints or limits imposed on the pace of restoration activities.

The Restoration Plan schedule is anticipated to begin with the elements that immediately restore flow through the system—specifically, beaver management and improvements at the outlet of Sequalitchew Lake. The actions will be followed by improvements that enhance flows (e.g., connections from Hamer Marsh) and make it easier to maintain flows (e.g., installation of the Railroad Trail bridge and sealing\restoration of the losing reach). Finally, habitat restoration, through culvert replacements and enhancement of wetland and stream habitats, is the final component of the Restoration Plan.

Although a detailed schedule has not been developed for implementation of the Restoration Plan, it is anticipated restoration activities will begin immediately shortly after Restoration Plan permits are obtained and it should require no more than 6 years to complete construction and implementation of all elements of the Restoration Plan. The

[1] Minimum durations for the pumping test and review and discussion stages of Steps 1 and 2 are established in Section 4.3. The specified timeframes add up to a minimum duration of 9 months, however this duration is unrealistically short as it does not include time for other key steps, like well installation or report writing.

flow restoration actions should be completed within two years from the start of the project, and followed by flow maintenance and enhancement, which may require 3 years to complete, but could overlap with the flow restoration actions. Finally, construction of habitat restoration improvements could be completed within 3 years and could overlap or dovetail with the related flow maintenance and enhancement elements.

A timeline relating the anticipated schedules for restoration and mining is presented on Figure 13. Restoration activities should be successful in restoring flows to Sequalitchew Creek within the first 2 years. During this time, the mining project would complete the second pumping test (Step 2) and, if groundwater levels meet performance thresholds and mining progresses at the fastest allowable pace, mine Segment 1A and advance into Segment 1B. The anticipated increase in flow is much greater than the potential impact from the mining project, and the full benefit in flow quantity may be achieved in these first 2 years; whereas the impact from mining is minimal at first and increases slowly over time. The impact from mining is expected to peak during mining of Segment 1C, when the greatest number of wells are pumping[2].

Even if mining is proceeding rapidly, CalPortland has committed that mining of Segment 1 would not be completed in less than 3 years, with each segment lasting at least 9 months. At this pace, the peak impact from mining could be expected around 2 to 3 years after the start of restoration. Even if delayed, the flow restoration action should have occurred by this time and only a fraction of flow restoration is necessary to offset the impacts from mining.

Performance Thresholds that are Supportive of Restoration. The cumulative effects analysis (Aspect and Anchor, 2016) found that the changes in the marshes would be dominated by the Restoration Project (which requires lowering marsh water levels to achieve flow from Sequalitchew Lake to the ravine), rather than increased infiltration resulting from lower groundwater levels. The marshes would have significantly more water flowing through them than under current conditions, resulting in consistent water levels year-round at the target levels established in the Restoration Plan, except for some periods in the driest years.

The cumulative effects analysis also concluded that the predominant cumulative effect on Sequalitchew Creek would be an increase in annual average flows by approximately 10 cfs, with abundant year-round flow most of the time. By comparison, the stream flow reductions from mining is expected to be less than 1 cfs, and only apparent during limited periods in atypical summers.

The anticipated benefits to streamflow from restoration are much larger than the potential impacts from mining. As a result, the success of the restoration project is not expected to be particularly sensitive to the groundwater levels resulting from mining. Monitoring during mining will ensure that groundwater levels remain within the expected range that will support the anticipated increases in stream flow from the restoration project. If

[2] To be conservative, the potential impacts of mining described in the cumulative effects analysis (Aspect and Anchor, 2016) were based on all wells pumping at the same time. In practice, this condition is unlikely to occur as initial wells would be phased off as mining progresses.

groundwater levels are not maintained within the expected range, corrective actions will be implemented in accordance with the adaptive management plan for mining.

Coordinated Monitoring and Information Sharing. To facilitate the coordinated collection and exchange of information, the two projects share an integrated SAP (Appendix B). The SAP outlines the collection of information on groundwater levels, surface water levels, streamflow, and surface water quality to support both plans. Each plan also outlines how information will be shared so that plan implementers have the data necessary to make informed management decisions.

Sampling and Analysis Plan

A.1. Introduction

This document presents the Sampling and Analysis Plan (SAP) to collect the information necessary to support the adaptive management processes of the South Parcel Monitoring Plan and the Restoration Plan for the Sequalitchew Creek Watershed. This SAP is intended to direct collection, processing, and reporting of data by a single, reliable, and consistent source that will be used to inform both adaptive management plans.

A.2. Background

A.2.1. Baseline Monitoring Program

A baseline monitoring program of surface water and groundwater within the Sequalitchew Creek basin is currently conducted by CalPortland as a component of mine planning. The monitoring program generally consists of measuring water levels and flows on a monthly basis at multiple locations in Sequalitchew Creek and its related marshes. The hydrologic monitoring program has four basic elements:

- Groundwater elevation monitoring;
- Surface water elevation monitoring;
- Surface water streamflow monitoring; and
- Surface water quality monitoring (e.g., temperature, dissolved oxygen, and turbidity).

The monitoring program is summarized in Table 1, and monitoring locations are shown on Figure 1.

The baseline monitoring program began in 1999, then expanded significantly in 2003. Monitoring data has previously been presented in four reports (Aspect, 2004a, 2004b; Aspect and Anchor, 2007; and Appendix B of Anchor QEA and Aspect, 2010). The 2004 reports describe the surface water and groundwater systems of the Sequalitchew Creek basin and summarize the monitoring data collected through 2004. The 2007 report presents monitoring data collected in 2005 and 2006. The 2010 report provides summary hydrographs of streamflow and marsh levels, illustrating the data available at that time.

A.2.1.1. Groundwater Level Monitoring

In the baseline monitoring program, groundwater levels are monitored monthly at a network of 20 wells located throughout the watershed, including within the mine area, marshes, and upland areas:

- North Parcel mine area: OB-1
- South Parcel mine area: CHMW-1, CHMW-2S and -2D, CHMW-3S and -3D, and CHMW-4S and -4D
- Marshes and Lakes:
    - Edmond Marsh: MW-EM-1S and -1D, MW-EM-2S and -2D, and EM-3
    - Hamer and McKay Marshes: MW-HM-1
    - Sequalitchew Lake: MW-SL-1
    - Pond Lake: MW-PL-1
- Upland areas: D-3 (near Landfill #5) and SRC-MW-2 (east of Hamer Marsh)

Water levels are measured manually by measuring the depth to water from the top of the well casing. The top-of-casing elevation of each well has been surveyed relative to the National Geodetic Vertical Datum of 1929 (NGVD 29) to allow for calculation of groundwater elevations. Well logs for the existing monitoring wells are provided in Attachment A.

A.2.2. Surface Water Monitoring

A.2.2.1. Water Levels

The baseline monitoring program includes monthly measurement of surface water elevations at 15 locations in the Sequalitchew Creek watershed (Figure 1).

In many locations, staff gages are located close to monitoring wells to allow for coupled observations of surface water and groundwater levels. The following staff gages are included in the baseline monitoring program:

- Bell Marsh: SG-BM-1
- McKay Marsh: SG-MKM-1
- Hamer Marsh: SG-HM-1
- Sequalitchew Creek Marsh: SG-SCM-1 and SG-EM-3E
- East Edmond Marsh: SG-EM-3W and SG-EM-2E
- West Edmond Marsh: SG-EM-1/1A and SG-EM-2W
- Wetland 1D: SG-WL1D-1
- Pond Lake: SG-PL-1

- Diversion Canal: SG-DC-1, SG-DC-2, and SG-DC-3

The typical staff gage installed on this project is an enamel plate capable of measuring water levels in 0.01-foot increments over a 3.33-foot range. The staff gages at the west end of West Edmond Marsh (SG-EM-1/1A) are paired, with SG-EM-1 located near well MW- EM-1 and used to measure higher water levels in winter and SG-EM-1A located in a low spot behind the beaver dam at the outlet and used for measuring lower water levels in summer.

In addition, surface water levels are measured as a component of the three continuous flow monitoring stations described in Section A.2.2.3.

A.2.2.2. Water Quality

Beginning in 2009, surface water quality has been monitored monthly at three locations: the Diversion Weir, the outlet of Hamer Marsh, and the mid-ravine gage on Sequalitchew Creek. Monthly monitoring consists of field measurements of temperature, dissolved oxygen, specific conductance, oxidation reduction potential, and turbidity with a YSI Pro Plus and a Hach Turbidimeter. Several samples have been collected for laboratory analysis for select metals (iron, copper, and zinc) and total petroleum hydrocarbons.

A.2.2.3. Streamflow

The baseline streamflow monitoring program consists of continuous measurements at three stations, periodic measurements at three stations, and visual observations at five locations. The specific locations monitored are:

- Continuous streamflow monitoring at the Diversion Weir, and mid-ravine[1] and lower-ravine stations in Sequalitchew Creek.
- Periodic streamflow measurements at three locations in the Diversion Canal (SG-DC-1, SG-DC-2, SG-DC-3); and
- Visual estimates of flow at five locations:
    - Culvert from Hamer Marsh to Edmond Marsh,
    - Culvert from Sequalitchew Creek Marsh to Diversion Canal
    - Ditch at Plant Road flowing to Hamer Marsh,
    - Sequalitchew Creek at footbridge downstream of W. Edmond Marsh, and
    - Sequalitchew Creek under Center Drive.

Measurements of streamflow are made using the conventional current-meter method as described by the U.S. Geological Survey (USGS, 1982). Stream velocities are measured and discharges are calculated using a SonTek Flowtracker.

Discharge measurements are initially made at various stream stages to determine a relationship between stage and discharge. Discharge measurements are then made at

[1] The mid-ravine station was formerly known as the Upper gage or SC-Upper.

periodic intervals to verify the stage-discharge relationship or to define any change in the relationship caused by changes in channel geometry and/or channel roughness.

Rating curves, which relate water depth to flow in the channel, have been developed for each flow monitoring location based on a number of manual flow measurements collected over a range of different flows. These rating curves are used to convert observed water depths (stage) to flows.

Stream stage at each station is measured using a 4230 Bubble Flow Meter manufactured by Teledyne ISCO and powered by a 12-volt deep-cycle lead-acid battery. The meter uses an internal air compressor to force a metered amount of air through a bubble line submerged in the flow channel. The water level above the bubble line orifice is determined by measuring the pressure needed to force air bubbles out of the line. An internal data logger records the water level as bubbler pressure at 15-minute intervals. The water level is converted to a stage height by correlating the meter readings to manual measurements taken during monthly site visits from a staff gage that is installed at each station. The equipment for the stations is serviced once a month by replacing the batteries and downloading the data to a portable computer.

Flow over the Diversion Weir is monitored by continuously monitoring stage using an ISCO 4230 and calculating discharge with a standard weir equation for a fully contracted rectangular weir from the United States Bureau of Reclamation's (USBR) Water Measurement Manual (USBR, 2001). The weir equation is presented in Section A.5.4.1.

A.2.2.4. Habitat Monitoring

Wetland Habitat

Wetland monitoring conducted to date has been focused on documenting baseline (pre-project) conditions of three key variables in habitats: topography, hydrology, and vegetation. Major changes to the boundary of Edmond Marsh have been analyzed from high-resolution aerial photos, and compared to field-collected data. Twelve vegetation monitoring transects are located throughout the Sequalitchew Creek basin: in Edmond Marsh, Sequalitchew Creek Ravine, Wetland 1D, Pond Lake, and Brackish Marsh. Overall, patterns in species presence detected during the monitoring in the period from 2004–2015 have been documented by Anchor QEA (2016).

Stream Habitat

Anchor Environmental (Anchor; now Anchor QEA) has previously evaluated stream habitat in Sequalitchew Creek using toe-width and stage-discharge analysis methods as a component of the Fish Habitat Benefit Evaluation for Sequalitchew Creek (Anchor, 2004). Additional information on the methodology and background can be found in that document.

The **Toe-Width Method** applies information on active channel width to estimate the optimal flows (maximum habitat) for salmon spawning and rearing. Within Reach 2 and 3, transects were established in areas with fairly uniform depth over a gravel/cobble substrate (5 transects and 4 transects, respectively). Since Reach 1 was located in the estuary, no toe-width transects were established. Additional transects were established to represent riffle habitat in all three reaches.

The **Stage-Discharge Analysis** provides a more detailed evaluation of how habitat availability changes with incremental increases in flow by linking data on the physical relationship between water surface elevation (stage), velocity, and discharge with the biological habitat preferences of spawning and rearing salmon. Stage-discharge relationships in lower Sequalitchew Creek were developed at numerous transects that were selected to be representative of habitat conditions in the study area.

A.3. Roles and Responsibilities

The roles and responsibilities of all key members of the monitoring team are shown in Table 2 below. The monitoring team may be comprised of one or more qualified consulting firms, governmental agencies (e.g., USGS or Ecology), or nongovernmental organizations.

Table 2. Monitoring Team Roles and Responsibilities

Position	Roles and Responsibilities
Project Manager—Monitoring Team	Responsible for oversight of monitoring personnel, coordinating project tasks defined in the Consultant scope of work, tracking project progress and schedule relative to budget, and manage staff to complete project activities.
Principal-in-Charge—Monitoring Team	Responsible for oversight to project team to ensure that QC procedures are followed and project data quality objectives (DQOs) are being met. Oversight of development of project SAP, field audits, and project reports.
Data QC/Reporting Lead—Monitoring Team	Responsible for developing SAP, standard operating procedures (SOPs), and data QA/QC procedures for project. Responsible for managing project database, completing data QC on all project data, and reporting for individual events and the overall project.
Technology Lead—Hydrology/Water Quality	Responsible for the design of each monitoring station. Provide oversight for installation of each station's monitoring system. Provide oversight for monitoring station maintenance and lead equipment troubleshooting activities.
Data Collection Lead—Hydrology/Water Quality	Manages and oversees monitoring and maintenance activities that are completed in the field for hydrology and water quality data collection.
Data Collection Lead—Habitat	Manages and oversees habitat monitoring activities.

A.4. Monitoring Approach

The monitoring conducted under this SAP will collect data necessary to assess whether activities associated with the South Parcel expansion and restoration of Sequalitchew Creek are achieving the objectives of the South Parcel Monitoring Plan and the Restoration Plan for the Sequalitchew Creek Watershed. The monitoring approach is targeted at the specific performance and aspirational thresholds identified in those plans.

The monitoring program includes six components that will be implemented at key locations within the watershed: groundwater level, surface water level, stream flow, surface water quality, habitat, and precipitation monitoring. Each of these components are described below. A cross walk between specific SAP elements and the objectives of the Monitoring Plan and Restoration Plan is provided in Table 3.

In addition to the main monitoring activities, stand-alone special studies will be implemented to address specific concerns of the mine expansion and watershed restoration. These special studies will be developed further as mining and restoration planning progresses, but are described generally in Section A.8.

A.4.1. Groundwater levels

Groundwater levels will be monitored primarily for comparison with the performance thresholds of the South Parcel Monitoring Plan.

Groundwater level monitoring will use the existing network of monitoring wells (described in Section A.2.1 and shown in Figure 1) and new dewatering wells and monitoring wells that will be installed specifically for this project. Water level monitoring will include a combination of spot measurements in active dewatering wells and adjacent temporary monitoring wells, continuous monitoring at key monitoring wells adjacent to the active dewatering area and beneath West Edmond Marsh, and routine monthly or semimonthly monitoring at other wells in the network.

As described in the Monitoring Plan, active dewatering of the South Parcel will occur in three sequential steps, involving progressively more dewatering wells, from 10 wells during Step 1, up to 66 wells during Step 3. Water levels will be measured periodically in the active dewatering wells, in new observation wells located adjacent to the active dewatering wells, and in several long-term monitoring wells installed in the interior of the South Parcel. Water level monitoring at these wells will be used to assess performance of the dewatering operation and, once mining operations commence in the South Parcel, will indicate if the moisture content of the mined aggregate is at appropriately low levels for safe, efficient mining and processing.

Outside of the South Parcel, groundwater level monitoring will consist of a combination of continuous monitoring and monthly or semimonthly manual measurements. During all Dewatering Steps, water levels will be monitored continuously in key wells located along the eastern boundary of the South parcel and in the western portion of Edmond Marsh. Specifically, the following key wells will be monitored continuously: CHMW-1, CHMW-2S and -2D, CHMW-3S and -3D, CHMW-4S and -4D. MW-EM-1S and -1D and MW-EM-2S and -2D. Water levels at all other groundwater monitoring wells will be measured monthly, except during Dewatering Step 2, when twice monthly measurements will occur, and Dewatering Step 3 when twice monthly measurements will occur for 3 months once new dewatering wells start pumping.

Monitoring wells are generally one- or two-inch-diameter PVC casings protected with a locking steel surface monument. Well depths vary from 5 feet for shallow piezometers to 85 feet for wells penetrating the Vashon Outwash gravels. Monitoring well logs are provided in Attachment A.

Continuous groundwater level monitoring will be conducted using a submersible pressure transducer connected to an aboveground data logger housed in a weather-resistant enclosure. Instruments will measure and record water level at 15-minute intervals. Data loggers will be downloaded by field staff at least weekly during Dewatering Steps 1 through 3 and once each month during Step 4.

A.4.2. Surface water levels

Surface water level monitoring data will primarily be used to compare the effects of restoration efforts with the performance and aspirational thresholds specified in the Restoration Plan. Surface water monitoring will occur at 12 stations as shown on Figure 1 and listed in Table 3 (station IDs have a "SG" prefix).

Continuous surface water monitoring will occur at SG-EM-1/1A and SG-EM-2E. Continuous water level data will be useful for assessing the water level response to precipitation. Water level will be measured manually once per month at the other stations; except during Dewatering Step 2, when twice-monthly measurements will occur. More frequent spot measurements will be made during specific restoration activities, such as the installation and adjustment of flexible levelers at beaver dams. New staff gage locations may be installed and added to the monitoring program as necessary to support adaptive management of the flexible levelers.

Surface water level monitoring at the seven locations in Sequalitchew Marsh, East Edmond Marsh, and West Edmond Marsh will provide feedback for efforts to increase westward flows in Sequalitchew Creek. Surface water level monitoring at SG-HM-1 in Hamer Marsh, in concert with groundwater level measurements at MW-HM-1 and MW-EM-3, will assess the increase in subsurface flow from Hamer Marsh to East Edmond Marsh following installation of the weir at Hamer Marsh outlet.

All surface water level monitoring stations are currently equipped with staff gages; either Stevens Style A or C porcelain-enameled iron plate. Style A gages are 3.33 feet long and 4 inches wide with graduated marks every 0.02 feet. Style C gages are also 3.33 feet long and are 2.5 inches wide with graduated marks every 0.01 foot. Water levels are measured to the nearest 0.01 foot. Water level is converted to surface water elevation by subtracting the staff gage height from the surveyed top-of-staff gage elevation and then adding the measured staff gage water level. At SG-EM-1 and SG-EM-2W, continuous water level monitoring will be conducted using a pressure transducer housed in a PVC stilling well that is mounted adjacent to the staff gage. The pressure transducer will be connected to the data logger used for continuous groundwater monitoring at the adjacent groundwater monitoring wells (MW-EM-1D for SG-EM-1/1A and MW-EM-2D for SG-EM-2W).

A.4.3. Streamflow

Streamflow monitoring will include:

- Continuous streamflow monitoring at five locations: the three existing streamflow monitoring stations (i.e., the Diversion Weir, and mid-ravine and lower stations in Sequalitchew Creek) and two new gaging stations on Sequalitchew Creek at the Lake Outlet and at Center Drive.

- Visual observations at the culvert from Hamer Marsh to Edmond Marsh.

At each continuous gaging station, water level will be measured and recorded every 15 minutes using a pressure transducer housed in a PVC stilling well and connected to a data logger that is housed in a weatherproof enclosure. Each continuous stream flow gaging station will include a Stevens Style A or C porcelain-enameled iron-plate staff gage, as described previous for the water level monitoring sites. Water level measured by the pressure transducer will be calibrated to the staff gage at the site. Field staff will service and download the data loggers at least monthly.

At the Diversion Weir, flow will be calculated using a standard discharge equation for a fully contracted rectangular weir as described above in Section A.5.4.1. At the other four gaging stations, stage-discharge or rating curves will need to be developed and maintained to calculate flow. Rating curves will be developed and maintained consistent with industry standard practices, as is currently done.

Flow through the culvert from Hamer Marsh to Edmond Marsh will be visually estimated monthly. Additional locations for visual flow estimates may be added at any time to respond to conditions observed in the field or adaptive management needs.

Following installation of the weir at the outlet of Hamer Marsh, outflow from Hamer Marsh to the Diversion Canal will be determined using the appropriate weir equation, based on water level observations at SG-HM-1, whose staff gage elevation relative the top of the weir will be established.

Continuous flow data from the Diversion Weir will be used to assess achievement of the Restoration Plan performance threshold to reduce flow to the Diversion Canal.

Continuous flow data from the Sequalitchew Lake Outlet and Center Drive gages will be used to assess achievement of the performance standard to match flows at those two locations.

Flow data at Center Drive, Upper Sequalitchew Creek, and Lower Sequalitchew Creek gages will be used to assess achievement of the performance standard to eliminate flow losses in the ravine.

Spot flow measurements at the Hamer Marsh Weir, at the culvert between Hamer Marsh and East Edmond Marsh, and in the ditch under Plant Road to Hamer Marsh, in concert with surface and shallow groundwater monitoring in and around Hamer Marsh, will be used to assess efforts to increase surface and groundwater flow from Hamer Marsh into East Edmond Marsh.

Going forward, the sampling program will no longer collect spot flow measurements in the Diversion Canal, since those data are not relevant to the objectives of the South Parcel Monitoring Plan or the Restoration Plan.

A.4.4. Surface Water Quality

The evaluation of habitat suitability will include monitoring water quality conditions in the watershed restoration area. In particular, stream temperature is predicted to increase in summer as a result of the restoration and mining projects for two reasons: 1) water

temperatures in Sequalitchew Lake are warmer than the groundwater discharge that currently provides the flow in Sequalitchew Creek during summer, and 2) dewatering for mining will reduce the groundwater discharge. Prior monitoring indicates that Sequalitchew Lake temperatures can reach up to 21°C in summer, whereas Sequalitchew Creek is currently 12 to 13°C. This condition is largely natural resulting from solar radiation on the lake surface. However, it also represents the primary tradeoff of restoration—greatly increased flow and reconnection to the natural water source in exchange for higher temperatures in summer.

The water quality monitoring program has been designed to monitor for unintended consequences, primarily focused on temperature, resulting from the restoration and mining projects. Stream temperatures will be monitored continuously at the five locations in the Sequalitchew Creek watershed where flow is measured (Sequalitchew Lake Outlet, Diversion Weir, Center Drive, and mid-ravine and lower ravine Sequalitchew Creek stations), as well as at the continuous water level monitoring stations in East Edmond Marsh (SG-EM-1 and SG-EM-2). The pressure transducers used to monitor water levels will be equipped with temperature sensors and will record water temperature every 15 minutes. The monitoring data will allow for developing temperature profiles along Sequalitchew Creek from headwaters to near the mouth.

These monitoring data will inform the adaptive management components of the Restoration Plan. The Restoration Plan includes several restoration elements that either include specific components that would reduce temperatures, or include flexible elements that could be implemented adaptively in response to monitoring data that indicate unanticipated effects on stream temperature. Specifically, the following elements of the Restoration Plan have components related to temperature, beyond those aimed at increasing flow through the system:

> G – Losing Reach—restoration of riparian vegetation in the losing reach will benefit stream temperature through shading.
>
> J – Ravine Habitat—this element is intended to adapt to habitat conditions that emerge once flow is restored in the ravine. Envisioned as being used to enhance stream structure through large woody debris placement, it could also be used to address temperature issues by creating pools as refugia or shading through riparian plantings.

In addition to temperature, water quality monitoring will include periodic *in-situ* monitoring of temperature, dissolved oxygen, and turbidity at select surface water level monitoring locations.

Periodic *in-situ* water quality measurements of temperature, dissolved oxygen, and turbidity will be collected using portable water quality meters. Measurements will occur monthly, except during Dewatering Step 2, when measurements will be taken twice each month. These water quality data, used in conjunction with measurements of physical habitat characteristics, will inform the assessment of habitat conditions relative to performance thresholds in the Restoration Plan.

A special study of Hamer Marsh water quality will be developed and implemented separately as described in Section A.8.

A.4.5. Habitat

A.4.5.1. Wetland Habitat

The most important effect of the combined mining and restoration projects would be the restoration of a surface water and wetland community connection between the ravine and Edmond Marsh. Data collection discussed in this section is focused on detecting changes to vegetation and habitat structure. This will be used in conjunction with the collection of hydrology data (see section A.5.2) and topography to understand the effects of the project. Hydrology (water surface elevation) data will be used to further understand habitat changes:

- Changes in water surface elevations, particularly in East Edmond Marsh;
- Changes in the magnitude of seasonal fluctuation in water surface elevations;
- Changes in the location and amount of open-water habitat, specifically any loss of open-water habitat in East Edmond Marsh, or greater persistence (later in the growing season) of open water habitats in West Edmond Marsh; and
- The establishment of a surface water and wetland community connection between the ravine and Edmond Marsh.

The baseline wetland habitat monitoring approach (see Section A.2.2.4) will continue to be used to identify patterns in plant species presence, hydrology, and topography under changing conditions along these established transects for comparison and analysis with post-project conditions. New transects will be established between Edmond Marsh and Lower Sequalitchew Creek. Baseline data was not collected in this reach due to the lack of flow and wetland or riparian vegetation during the baseline period.

A.4.5.2. Stream Habitat

Stream habitat will be monitored by measuring physical habitat characteristics at consistent locations over time. Habitat monitoring stations will be established as cross sections of Sequalitchew Creek spaced 100 feet apart for 1,500 feet upstream of the BNSF culvert, then 200 feet apart upstream to the east end of Edmond Marsh. This will provide additional resolution in the area likely to be used for spawning by Chum.

At each section, the following physical parameters will be monitored: flow depth, velocity, substrate size and cover. Cross sections will be monitored in years 0, 1, 2, 3, 5, and 10 commencing prior to construction of the first Restoration Plan element.

Observations of fish presence and active erosion will be noted during the cross-section surveys. Surveys of large woody material will be conducted in years 5 and 10.

A.4.6. Precipitation

Precipitation will be continuously monitored with a tipping bucket rain gage to be located on or near the South Parcel (e.g., City Hall, Pioneer Middle School, or Chloe Clark Elementary). An on-site, program-operated rain gage will likely provide a more complete data set that is of known quality and will better represent precipitation occurring within the watershed than would data from the McMillin Reservoir rain gage, which has been used for prior monitoring efforts.

A continuous precipitation record will provide a context for evaluating short-term changes in surface water and shallow groundwater levels, stream flows, and water quality conditions monitored within the watershed in response to storm events. Observed seasonal precipitation patterns will be used in the analysis of seasonal groundwater and surface water levels, stream flows, and water quality conditions.

The rain gage will be installed at the top of a 1.5-inch-diameter steel pole, approximately 10 feet above the ground surface. The rain gage will be wired to a data logger that will record and totalize rainfall on a 15-minute interval. The data logger will be housed in a durable, weatherproof steel enclosure.

The rain gage will be maintained per manufacturer's recommendations (see Section A.5.7 for methods). The rain gage will be capable of measuring only liquid precipitation (i.e., rainfall or melted snow); it will not be a heated rain gage capable of melting snow. Alternate rain data from the McMillin Reservoir rain gage or PRISM estimates of gridded precipitation for the project area will be used should the project rain gage malfunction.

A.5. Monitoring Procedures

This section provides specific procedural guidelines regarding routine field measurement and maintenance activities pursuant to the monitoring objectives detailed in the previous section.

Campbell Scientific (CSI) pressure transducers and data loggers will be employed at groundwater, surface water, streamflow monitoring stations, which continually measure level and water temperature. A project rain gage will be installed at one of the central monitoring stations, and be recorded by the station data logger. Equipment specifications and installation guidelines for continual monitoring stations includes the following:

- Parameter data (e.g., level, temperature, precipitation) will be recorded at a minimum of 15-minute intervals.
- Transducers selected for each station will be designed with a PSI range and cable length that is appropriate for the range of water levels expected in the observation well or surface water environment.
- Transducer sensor diaphragms will be vented to the atmosphere; eliminating corrections regarding barometric pressure compensation.
- Groundwater pressure transducers will be suspended from a fixed reference point in each monitoring well, at a point below the lowest expected water level. Suspending

the transducer prevents corrosion/interference of benthic sediment, or level discrepancies/drift due to settling.

- Surface water pressure transducers will be installed at a fixed point within a PVC stilling well, adjacent to the station staff plate.
- All level and flow rate measurements will be reported in decimal-feet and cubic feet per second (cfs), respectively.

Water levels measurements at stations recording continuous data will be maintained within a 0.02-foot tolerance. If the difference between the level measured during site inspections and the data logger recorded level is greater than ± 0.02 feet, field personnel will calibrate the data logger recorded level during routine site inspections. Differences in level, as well as calibration points, will be recorded on field sheets. Level drift observed from either the pressure transducer, or movement of the suspension cable, will be corrected by linear interpolation within the project dataset.

A.5.1. Routine Station Inspections

Routine site inspections will occur at least monthly while the project is actively collecting water quality, level, and/or flow data. Field staff will complete a field data collection form, or electronic equivalent, when conducting station inspections (see example in Attachment B). During monthly inspections, all equipment will be maintained per manufacturer recommendation, and include the following tasks:

- Download data logger module records;
- Maintain station grounds for clear and safe access;
- Clean and maintain enclosures, sensors, and monitoring equipment;
- Change/charge station batteries; and
- Calibrate/verify the accuracy, precision, and operation of sampling and monitoring equipment.

All observed and recorded field measurements, as detailed below, will be updated within the project database following routine inspection activities.

A.5.2. Groundwater levels

Groundwater levels are measured in monitoring well stations using a 150- or 300-foot electronic water level indicator. Depth to water is measured from a black mark on the top of the well casing and recorded to the nearest 0.01 foot. The depth to water is converted to a groundwater elevation by subtracting the depth to water from the surveyed top of casing elevations. Groundwater level measurements will be conducted and recorded on field sheets, or electronic equivalents, during each routine site inspection.

The well casings are accessed by unlocking and removing the lids on the steel stick-up-style monuments protecting each well. MW-C5-3 is maintained by JBLM. A key to unlock MW-C5-3 is obtained from JBLM during each site visit.

A.5.3. Surface water levels

Surface water levels are visually observed/measured during routine site inspections from staff plate gages; measured to the nearest 0.01 foot. Water levels will be converted to surface water elevation by subtracting the staff gage height from the surveyed top-of-staff gage elevation and then adding the measured staff gage water level.

A.5.4. Streamflow

Streamflow monitoring for this project will be performed by continuously observing the water level in the stream and calculating flow using one of two methods: a standardized weir-discharge equation or a stage-discharge rating curve.

Stream water levels will be visually observed/measured during routine site inspections from staff plate gages. CSI pressure transducers at continuous-record streamflow stations will be calibrated to the correspond station staff-gage level. Spot level measurements and observations at all other stations will be recorded during routine inspections. All level measurements will be used to calculate and update discharge flow volumes from each station.

A.5.4.1. Weir-Discharge Equations

Streamflow at the Diversion Weir is calculated using a standard discharge equation for a fully contracted rectangular weir from the USBR's Water Measurement Manual (USBR, 2001). The equation relates discharge (Q) to the length of the weir (l) and depth (d) of water over the weir as follows:

$$Q = 3.33*(l - 0.2*d)*d^{(3/2)}$$

It is imperative to maintain flow through weirs free from debris and obstructions, to ensure accurate level/flow measurements. Weir discharge equations will be incorporated into the project database, to ensure precision when field personnel transcribe field observations and measurements.

A.5.4.2. Stage-Discharge Rating Curve

Open-channel streamflow monitoring stations require the development of flow rating curves, which relate observed water depths (i.e., stage) to flow volumes. Rating curves will be developed for each flow monitoring location based on manual flow measurements collected over a range of different flows.

Measurements of streamflow (in cubic feet per second [cfs]) will be made using the conventional current-meter method as described by the USGS (1982). Stream velocities will be measured and discharges are calculated using a SonTek Flowtracker, or other similar velocity meter.

In accordance with the USGS current-meter method, observations of width, depth, and velocity will be made at approximately 10 to 15 intervals in a cross section by wading the stream. The average velocity of each subsection will be taken at 0.6 of the depth below the water surface. That velocity represents the average velocity for that stream subsection, whose cross-section area will be calculated from the corresponding width and

depth measurements. A streamflow measurement is the sum of the flow in each subsection.

The recorded discharge measurements are plotted against corresponding stage heights. The stage-discharge rating (i.e., regression equation) is determined by plotting a best-fit line through a series of stage-discharge points.

Rating curves will be developed at streamflow monitoring stations during a minimum of three (3) different flow event regimes, including flows covering the low-, mid-, and high ranges of the depths expected in each channel. To measure flows at these ranges, field personnel will collect flow measurements during various intensity storm events, as well as baseflow conditions. For existing stations, the rating curves developed during baseline monitoring will be used initially.

Rating curves are evaluated by comparing sets of flow event measurements to determine if the average rating curve for each event graphs similarly on a stage-discharge plot. A change in curve shape or shift in location indicates a change in channel geomorphology and a new rating curve is developed and updated, as necessary. Manual streamflow measurements are made at periodic intervals to verify the rating curve and evaluate if there has been any change in the stage-discharge relationship caused by changes in channel geometry and/or channel roughness. Rating curves were previously developed and reported for the mid-ravine and lower Sequalitchew Creek stations (Aspect and Anchor, 2007), and have continued to evolve since. The rating curves from these stations will be evaluated against new flow-discharge measurements, to ensure updated and accurate rating curves are used.

A.5.5. Surface water quality

Surface water quality parameters, including temperature, dissolved oxygen, pH, and turbidity will be monitored at all surface water stations. Water quality parameters are measured with a YSI Pro Plus multiparameter meter and a Hach Turbidimeter or equivalent instruments.

Surface water temperature will be continually logged by integrated CSI pressure transducer temperature sensors or equivalent equipment (e.g., Onset Hobo/Tidbit© temperature loggers). Temperature sensors will have a minimum accuracy/precision range of +/- 0.2°C. Temperature sensors will be calibrated and maintained in accordance with Ecology's (2015) Standard Operating Procedure (SOP) for Continuous Temperature Monitoring of Fresh Water Rivers and Streams (EAP080). Deployment techniques for temperature sensors/loggers will follow guidance and from Ecology's SOP; however, may vary slightly based on alternative equipment specifications.

Table 4 summarizes the water quality parameters and standard methods that will be employed for the surface water quality monitoring objectives of this project.

Table 4. Water Quality Grab Sample Parameters and Methods

Sample Type	Field Collection Containers	Parameter	Holding Time	Method	Lab Sample Container	Preservative
Continuous	*In-situ* stream or surface water station	Temperature	N/A	Continually logged via CSI pressure transducer, or equivalent	*In situ* (n/a)	*In situ* (n/a)
Grab	1-liter poly	pH	15 minutes	EPA 150.1 via YSI	*In situ* (n/a)	*In situ* (n/a)
		Dissolved Oxygen	15 minutes	EPA 150.2 via YSI	*In situ* (n/a)	*In situ* (n/a)
		Turbidity	15 minutes	EPA 180.1 via YSI	*In situ* (n/a)	*In situ* (n/a)

Manual grab samples will be collected by directly filling sample bottles from the monitoring discharge point, using a “clean hands” approach. The principle of the “clean hands” technique is that field personnel wear appropriate noncontaminating, disposable, powderless gloves during the entire grab sample collection procedure; changing gloves frequently with each change in task.

In-situ measurements with the YSI multiparameter meter may be conducted by directly submerging the sensors into surface waters, so long as there is no interference from bottom sediments or debris.

A.5.5.1. Equipment maintenance

Monitoring equipment will be inspected and serviced as recommended by the manufacturer, or at least once preceding the deployment of temporary monitoring station setups. Generally, equipment maintenance includes: inspection, testing, calibration, and replacement of worn or missing components. Table 5 summarizes the water quality field equipment specifications for this project, including: parameters, decontamination, and calibration procedures.

Table 5. Field Monitoring Equipment Decontamination and Calibration Procedures

Equipment	Parameters	Decontamination Procedure	Calibration Procedures
YSI water quality multimeter, or equivalent	pH; dissolved oxygen	Rinse sensors thoroughly with DI water as needed Store sensors in KCl solution between uses.	Perform the following prior to each site inspection: • Three-point calibration of pH (4,7,10) • Dissolved oxygen using barometric pressure and/or saturation method
HACH Turbidimeter, or equivalent	Turbidity	Rinse sample vials thoroughly with DI water as needed.	Perform reference calibration before every sample period, in accordance with manufacturer specifications.
Continually logged via CSI pressure transducer, or equivalent	Temperature	Gently clean temperature loggers with a soft cloth or soft-bristled brush to remove any biofouling or sediment.	Record ten reference *in-situ* measurements using NIST field thermometer. Compare the mean absolute value of the NIST thermometer measurements against the continuous temperature logger for the same time period; ensure the mean difference isn't greater than 0.2°C.

A.5.5.2. Qualitative Observations

In addition to the quantitative observations of water quality described above, surface water stations will be qualitatively inspected for the following, where applicable:

- Channel conditions, including the presence/absence of beaver dams, downed trees, streambed composition, vegetation, and particularly fast or slow flow velocities.
- Water color, floating oil and grease, floating debris/scum, and materials that may be toxic or harmful to human or other life.

A.5.6. Habitat

Habitat data are collected for two purposes: 1) stream cross sections are measured for comparison with the performance and aspirational thresholds of Goal 2 of the Restoration Plan, and 2) wetland and additional stream habitat measurements are collected to understand the linkages between stream restoration activities and effects on habitat. The wetland and additional stream habitat measurements could inform decisions to employ additional adaptive management strategies or modify existing strategies to limit impacts and/or increase benefits. The supplemental data would not be applicable to the evaluation of performance or aspirational thresholds.

A.5.6.1. Wetland Habitat

Wetland habitat will be measured using established transects with surveyed topography that has been related to surface water monitoring stations. The protocols for point intercept methods for determination of the vegetation community will generally follow Heady et al., 1959. Vegetation data will be collected annually at the end of the growing season (September or October, typically). A tape measure will be strung between fixed points (T-stakes or rebar, typically) and all vegetation species present at each given interval (1-foot or 2-foot, depending on transect length) will be recorded along with the distance from the start of the transect for correlation to surveyed ground surface elevation and surface water elevation data collected throughout the growing season.

A.5.6.2. Stream Habitat

Habitat monitoring stations will be established as cross sections and marked with driven rebar, or similar, in the field. Stations will be spaced 100 feet apart for 1,500 feet upstream of the BNSF culvert, and will be spaced 200 feet apart upstream to the east end of Edmond Marsh. At each section, the following data will be collected, at the frequency indicated in Table 6.

Table 6. Stream Habitat Monitoring Parameters and Methods

Parameter	Method	Precision/ units	Frequency
Depth	Measured every 2 feet within the wetted width of the section using a stadia rod.	0.1 foot	Years 0,1,2,3,5,10
Velocity	Measured at least every 2 feet within the wetted width of the section with a minimum of five measurements using a current velocity meter (Swoffer 2100 or similar).	0.1 feet per second (fps) for velocities between 0.5 and 25 fps	Years 0,1,2,3,5,10
Substrate size	D50 of randomly chosen substrate at least every 2 feet within the wetted width of the section with a minimum of 10 measurements.	1 mm	Years 0,1,2,3,5,10
Cover	Densiometer	Intersects	Years 0,1,2,3,5,10

Additional observations will be collected along the creek and referenced by distance upstream from the BNSF culvert (by station), as shown in Table 7.

Table 7. Additional Habitat Observations

Parameter	Method	Precision/ units	Frequency
Large Woody Material	Repeat existing survey based on methodology by Fox and Boulton (2007).	Count	Years 5, 10
Fish Presence	Visual identification	Species/ size (approx.)/ behavior	0,1,2,3,5,10
Active erosion	Visual identification	Photo documentation with scale	0,1,2,3,5,10

All data, except large woody material, will be collected once per indicated year in November or December when flows are between 100 and 200 percent of mean monthly average flow (or as predicted during years 1 and 2). Data on large woody material can be collected at any time of year.

All data will be presented in an annual monitoring report, including summarization and analysis of the data in terms of the quantity of usable and optimal habitat for Chum spawning and salmonid rearing. Trends over monitoring years will be included along with adaptive management considerations regarding the project performance or this sampling methodology.

A.5.7. Precipitation

For this project, a Hydrological Services Model TB3, or similar, tipping bucket rain gage will be installed at the designated site on the South Parcel. This instrument measures rainfall at 0.01-inch increments. The rain gauge will be connected to a CSI data logger, recording rainfall data at 15-minute intervals. The rain gage will be downloaded at least once each month. Field staff will inspect the rain gage monthly and service as needed. Rain gage calibration checks will occur using the method and at the frequency recommended by the manufacturer.

A.6. Quality Control

This section presents the quality control (QC) requirements for field and laboratory activities associated with this project.

A.6.1. Field

Field measurement equipment, dataloggers, and pressure transducers will be maintained and calibrated every month, at a minimum, to help ensure proper monitoring station operation. Preventative maintenance of the pressure transducers and water quality multimeters will be performed as specified by the manufacturer. The pressure transducers and sensors will be calibrated to the manufacturer's recommendations.

Original field records will be maintained in designated binders for all monitoring and field-related activities using project-specific forms, and guided by the procedures outlined in this SAP. Field documentation will include monthly inspection field sheets, maintenance/calibration logs, COC forms, and other required documentation. All entries in field notebooks will be written in pencil or waterproof ink. When errors are made,

project staff cross-out the error and enter the correct information. All corrections will be initialed and dated. Electronic equivalents of field forms may be used.

Field personnel will employ the following additional field-sample collection QC procedures, as needed:

- Collect grab water quality samples in certified contaminant-free or properly decontaminated containers.
- Use "clean hands/dirty hands" sampling techniques (that is, one team member performs "dirty tasks," while the other member performs "clean tasks," such as handling sample collection bottles).
- Hold samples on ice in coolers during retrieval and delivery to analytical laboratory.
- Deliver samples to analytical laboratory with proper chain of custody, and within holding times.

A.6.2. Laboratory

An accredited laboratory will be contracted to complete additional analyses, as needed, by the inclusion of special studies. Analytical test methods will be standardized and in accordance with procedures approved under 40 Code of Federal Regulations (CFR) §136. The minimum laboratory QA/QC requirements shall also include, but may not necessarily be limited to the following:

- Calibration of analytical laboratory instruments within acceptable limits.
- Periodic inspection, maintenance/servicing, and analysis of quality indicator samples, as necessary, to determine the accuracy and precision of procedures, instruments, and operators.
- Statistical procedures, such as control charts to monitor the precision and accuracy of the analytical data and to establish acceptance ranges and control limits. These data shall be maintained with project records and available upon request or during an audit.
- A continuous review of results to identify and correct problems originating with the instrument, the methodology or the analyst.
- Thorough documentation of the performance of systems, procedures, and operators.
- Certify that electronic data deliverables will exactly match all hard copy data.
- Provide notification of all nonconforming events and conditions, including missed holding times and delays in turnaround time, potentially impacting sample analysis.

A summary of laboratory QA/QC procedures will be requested in the final analytical report deliverables.

A.7. Data Management

This section describes the data management procedures to be used for ensuring access to consistently reliable data. The data management procedure includes 1) recording measurements in the field, 2) downloading data from storage devices in the field, and 3) transferring these data into project databases. There are two separate databases, one for hydrologic data and managed by the hydrology/water quality consultant, and a second for storing vegetation information from the wetland transects and quadrats in the marshes and creek, managed by the habitat consultant. This section defines the structure, inputs, outputs, and quality assurance(QA) and quality control (QC) procedures for the hydrologic database. These data management procedures closely follow those used for current and prior monitoring activities.

A.7.1. Hydrologic Data Collection

Field measurements/observations will be recorded in the field notebook. The field notebook will include the following data sheets: field visit data sheets, field equipment calibration sheets, and the equipment maintenance activity log. Custom field data sheets will be developed for the actual equipment installed. Examples of field data sheets are in Attachment B. Electronic equivalents of field forms may be developed and used.

The Data Collection Lead is responsible for updating and storing the field notebook. The field notebook will be photocopied monthly, and the copy stored at the Consultant's offices. Data loggers will be downloaded onto a project-designated field computer using applicable software and returned to the Consultant's office for transfer to the project database, as described below. Information from field notebook is transcribed into the project database manually. The project data files and database are stored on the Consultant's server, which is to be backed up for disaster recovery purposes at least once per week.

A.7.2. Hydrologic Database Structure

Hydrologic data are stored in an existing central Microsoft Access database created for the ongoing monitoring activities, and a set of specially formatted spreadsheets for ISCO datalogger data. The database will be used to assist with the analysis of groundwater and surface water conditions, and both consolidation and dissemination of information to other parties. The database provides a central storage area for ongoing data collected by Aspect Consulting, LLC and previous data sources, and allows data to be viewed in a uniform manner.

This database is structured such that, whenever possible, user input is validated using predefined formats and common terms making data input fast and simple, while ensuring that data can be accessed reliably through predefined queries. The data management tools in the database include:

- Task/field event setup for verifying completeness of data;
- Manual data entry;
- Querying and reporting tools; and

- Output of graphs and tabulated data.

Additional features designed to protect the integrity of the data and ensure smooth operation of the database include compact on close, tag data additions and modifications with date/time stamp and user id, and "*edit guard*" function that avoids inadvertent editing errors.

Due to the volume of ISCO bubbler data collected since 2004, it is currently managed as a set of Excel spreadsheets that combine to allow storage, correction, and graphing of the raw 15-minute stage data into final analysis and figures.

A.7.3. Database Inputs

Existing hydrologic data currently reside in the database. Data from planned monitoring described in this SAP will be routinely entered into the database as described below.

A.7.3.1. Existing Data

The following types of data were previously input for existing monitoring points:

- Survey coordinates and elevation data for staff gages and well top-of-casing elevations;
- Staff gage and well water level data;
- 15-minute continuous-record stream stage data;
- Stream stage-discharge rating equations for SC-Upper and SC-Lower;
- Standard weir equation for the Diversion Weir; and
- Spot flow measurements.

Existing water quality data is stored in an EQUIS database.

A.7.3.2. New Data

Data inputs from planned data collection include:

- Survey coordinates and elevation data for new staff gages (e.g., at SC-Center Drive gaging station and Sequalitchew Lake Outlet gaging station);
- New surface water staff gage measurements;
- Depth to groundwater measurements from wells;
- Monthly 15-minute stage-height data files for continuous flow and surface water monitoring stations;
- Monthly 15-minute groundwater level data files for continuous groundwater level monitoring stations;
- Monthly 15-minute precipitation data files from on-site rain gage;
- Water quality data;
- New manual streamflow flow measurements; and

- New stream stage-discharge rating equations, as necessary.

Staff gage, depth-to-groundwater, and spot water quality measurements are manually entered directly into the database using the manual data entry form following each field visit. The form includes fields for all monitoring data to help verify completeness.

Continuous stage height, groundwater level, temperature, and precipitation data files are loaded into the database and verified against manual measurements. Manual streamflow measurements and staff gage readings for the Sequalitchew Lake Outlet, SC-Center Drive, SC-Upper, and SC-Lower gaging stations are also entered into MS Excel to evaluate the appropriateness of the current rating curves for each station. When a new rating equation is necessary, it is entered manually into the database and applied to a specific date range for the station.

A.7.3.3. Back-up Precipitation Data

In the event the project rain gage malfunctions, precipitation data from the McMillin Reservoir weather station will be used to fill data gaps, as available. The McMillin Reservoir weather station is located about 20 miles northeast of the project area. This gage was selected as the most appropriate source of back-up precipitation data because it is the closest station with a lengthy period of record, and it receives similar monthly and annual precipitation amounts (Aspect, 2004a).

The precipitation data from McMillin Reservoir are collected as a part of the National Weather Service's (NWC) Cooperative Observer Program (COOP). Electronic files of daily precipitation can be downloaded from the COOP website and imported directly into the database using automated data import routines.

A.7.4. Database Outputs

Figures and tabulated data outputs are generated by an either automated output from the database, or generated via spreadsheet through Tableau. When new figures or tables are desired, water levels and flows are recalculated and printed from their appropriate software.

Water level elevations are calculated in the database, based on the supplied reference elevations for each point. The surveyed elevation of staff gages and monitoring wells is input in the database with a timestamp of when it was measured. Old water levels can be recalculated, based on resurveyed reference elevations when new ones become available.

Raw stage data from the continuous record stream gages is processed with the supplied stage-discharge ratings. Each station has a list of correlations that are applied over a specified time frame—typically for a given year or set of years. From the processed stage data, streamflow in either hourly or 15-minute data intervals is then averaged to mean daily flow for use in graphs and tables.

Precipitation data from the site rain gage is processed to calculate daily, monthly, and annual precipitation totals. Precipitation data at the appropriate time scale is exported to Excel for display on graphs and tables. The data export includes qualifiers indicating the quantity of missing data, if any.

Water quality data are stored and processed in the database. Continuous temperature data will be aggregated to calculate daily and monthly minimum and maximum temperatures as well as the 7-day average of daily maximum temperatures (7-DADMax), which has regulatory significance. Periodic water quality observations will also be output from the database.

A standard monthly report will be developed to assist with routine sharing of information during the mining and restoration projects. The report format will present a summary of observations for the prior month, and compare the observations with relevant performance and aspirational thresholds to determine if the adaptive management processes have been triggered.

A.7.5. QA/QC Protocol

QA/QC protocol for this project fall into three categories, based on which step of data collection and entry is taking place. Data QA/QC occurs during data collection in the field, data entry, and data reporting.

Key components of each QA/QC procedure are summarized below.

A.7.5.1. Data Collection

- The task/field event setup feature identifies all current monitoring points, and organizes them in the order that the data is typically collected on preprinted field forms. This feature helps ensure the completeness of data, especially in the event of field staff turnover.
- While measurements are being collected, the field staff quickly references the previous event's field form to verify the current measurement seems reasonable, and remeasures if necessary.

A.7.5.2. Data Entry

Manual data entry utilizes real-time data verification against defined valid values, acceptable data ranges, expected parameters, and standard data formats. Entries that fall outside these defined parameters will return an error message and reject the data.

A.7.5.3. Data Reporting

After each data entry event, data is reviewed in tabulated and graphical formats. This allows the user to readily identify data outliers and missing values. Data tables and figures will be inspected each month as a final step to verify the completeness and quality of monitoring data.

A.7.6. Data Archival (EIM)

To provide long-term data preservation by a neutral party, data collected under this SAP will be uploaded annually to Ecology's Environmental Information Management (EIM) database: http://www.ecy.wa.gov/eim/. Alternately, data collected by a governmental party with a similar, publicly accessible database (e.g., USGS's Nationwide Water Information System) may be stored in that database.

A.8. Special Studies

This SAP describes the routine monitoring approaches and methods for use in implementing the mining and restoration plans. Those plans also identify several special studies—notably the 60-day pumping test proposed as Step 1 of dewatering, and a study of water quality in Hamer Marsh to determine if it is adequate for improving the connection to Sequalitchew Creek. Specific plans will be developed for these studies, and others that may arise during implementation and adaptive management of the projects.

Geologic & Monitoring Well Construction Log

Project Number	Well Number	Sheet
040001	BM-MW-1	1 of 1

Project Name: North Sequalitchew Creek
Location: DuPont, Washington
Drilling Method: Hollow Stem Auger - 4" ID ; Holt Drilling
Sampling Method: 3" Diameter D&M

Top of Casing Elev. (ft mllw): 232.32
Ground Surfave Elev. (ft): 229.37
Depth to Water (ft bgs): 12.5
Start Date: August 3, 2004
Finish Date: August 3, 2004

Depth feet	Well Construction	Tests\Remarks	Blows/ 6"	Sample ID	Mtl. Graphic	Description
1	5" diameter steel monument, cement seal 0'-1.5'					Brown, dry, GRAVEL, trace silt; gravel fine to coarse, predominantly coarse; abundant cobbles, subrounded to rounded (GW)
2						
3						(Road fill)
4	Natural Fill 1.5'-5'					
5		18"/4"	11	5-6.5		Brown to tan, moist sandy GRAVEL, trace silt; gravel fine to coarse, subrounded to rounded; sand predominantly medium to coarse.
6			12			
7			10			
8		18"/12"	4	7.5-9		Brown to reddish brown, moist, slightly gravelly SAND, trace silt; sand fine to coarse, predominantly medium; gravel fine, subangular to rounded (SP)
9	Bentonite Chips 5'-12'		10			
10			16			
11		18"/5"	9	10-11.5		Occasional coarse gravel and grades medium to coarse sand.
12		8/3/04 ▼	15			
13		18"/6"	19			
	10/20 silica sand filter pack 12'-26.5'		8	12.5-14		Brown to red-brown, wet, gravelly SAND, trace silt; sand predominantly coarse; gravel fine to coarse, predominantly fine.
15		18"/10"	14			
16			15			
17			9	15-16.5		
18		18"/8"	10			Yellowish-green to brown, highly oxidized, wet, slightly to trace silt; sandy GRAVEL; gravel fine to coarse; sand predominantly coarse (GW-GM)
19			16			
20	20-slot screen 15'-25'; slip cap with SS screw 25'-25.3'	18"/12"	5	17.5-19		Yellow brown, highly oxidized, wet, slightly gravelly SAND, trace silt; sand medium to coarse, predominantly coarse; gravel predominantly fine (SP)
21			8			Grades to slightly silty and gravelly in shoe (SP-SM)
22			8			
23		18"/14"	9	20-21.5		Gray olive, wet, SAND; trace gravel; trace to no silt; sand predominantly medium to coarse (SP)
24			11			
25		18"/3"	13			Gray green, wet, slightly silty to trace silt, sandy GRAVEL; gravel fine to coarse, subrounded to rounded; sand medium to coarse. (GP-GM)
26			13	22.5-24		Gray green, wet, SAND; sand medium (SP)
27			25			
28			24			Gray olive, wet, sandy GRAVEL, trace silt; gravel fine to coarse, sand predominantly medium to coarse (GP)
29			28	25-26.5		Gray olive, wet, slightly silty sandy GRAVEL; gravel fine to coarse; sand medium to coarse (GP-GM)
			19			
			17			Total depth = 25' drilled; 26.5' driven.

Sampler Type (ST):

___ IN ___ TO ___ FT.

FORMATION DESCRIPTION

0'-5' Coarse sand with medium gravel, brown in color

5'-10' Coarse to medium sand, with large and medium cobbles

10'-15' Fine silty sand, wet, light brown

11' Static water level

15'-20' Fine, dense sand with silt and uniform cobbles

20'-24' Fine silty sand, dense with uniform cobbles

WELL DEVELOPMENT DATA

8-12-96 Bailed 15 gallons from well to remove sediments
Temperature: 60 degrees F
pH: 6.0 Very silty, brown

8-14-96 Pumped 150 gallons from well to stabilize.
Temperature: 60 degrees F
pH; 6.0 Clear, no sediment

CalPortland -- Dupont, WA

YSI Professional Handheld Multimeter Calibration Record	
CONDUCTIVITY and PH CALIBRATION*	DO CALIBRATION*
1. Press the Cal key. **2. Highlight the parameter you wish to calibrate and press enter. For Conductivity, a second menu will offer the option of calibrating Specific Conductance, Conductivity, or Salinity. Calibrating one automatically calibrates the other two. An additional sub-menu will require you to select the calibration units. For pH, auto-buffer recognition will determine which buffer the sensor is in and it will allow you to calibrate up to 6 points.** **3. Place the correct amount of calibration standard into a clean, dry or pre-rinsed container.** **4. Immerse the probe into the solution, making sure the sensor and thermistor are adequately immersed. Allow at least one minute for temperature to stabilize.** **5. For any of parameters, enter the calibration solution value by highlighting Calibration Value, pressing enter, and then using the alpha/numeric keypad to enter the known value. Once you have entered the value of the calibration standard, highlight <<<ENTER>>> and press enter.** **6. Wait for the readings to stabilize, highlight Accept Calibration and press enter to calibrate.** **7. For pH, continue with the next point by placing the probe in a second buffer and following the on-screen instructions or press Cal to complete the calibration.**	The Pro Plus offers four options for calibrating dissolved oxygen. The first is an air calibration method in % saturation. The second and third calibrates in mg/L or ppm to a solution with a known DO concentration (usually determined by a Winkler Titration). Calibration of any option (% or mg/L and ppm) will automatically calibrate the other. The fourth option is a zero calibration. If performing a zero calibration, you must perform a % or mg/L calibration following the zero calibration. For both ease of use and accuracy, YSI recommends performing the following 1-point DO % calibration: 1. Moisten the sponge in the cal/transport sleeve with a small amount of water and install it on the probe. The cal/transport sleeve ensures venting to the atmosphere. Disengage a thread or two to ensure atmospheric venting. Make sure the DO and temperature sensors are not immersed in the water. 2. Turn the instrument on. 3. Press the Cal key, highlight DO and press enter. 4. Highlight DO%, then press Enter. 5. Verify the barometric pressure and salinity displayed are accurate. Once DO and temperature are stable, highlight Accept Calibration and press enter.
*Additional calibration information can be found at: http://www.ysi.com/media/pdfs/605595-YSI-Pro-Plus-Quick-Start-Guide-RevB.pdf

1 Introduction

Glacier Northwest, Inc. dba CalPortland is seeking regulatory approvals for the Pioneer Aggregates South Parcel Project (South Parcel Project or Project), which proposes to extend sand and gravel mine operations to the southeast of existing activities at the Pioneer Aggregates Mine in DuPont, Washington. This Fisheries Technical Report (Report) has been prepared in support of the South Parcel Project. Figure 1 provides an overview map of the South Parcel Project.

This document evaluates the environmental conditions and potential impacts of the South Parcel Project (Proposed Action) and No Action Alternative on fisheries resources. These analyses are being conducted as a component of the State Environmental Policy Act (SEPA) evaluation for the South Parcel Project.

The following Report describes existing conditions of fisheries (affected environment) and potential impacts from the Proposed Action. In addition, proposed monitoring and mitigation measures for the Proposed Action are presented. The Sequalitchew Creek Restoration Plan, developed by CalPortland and the Environmental Caucus in accordance with the 2011 Settlement Agreement, includes a commitment from CalPortland for funding, monitoring data, and advocacy. The plan also requires coordination between the Environmental Caucus, South Puget Sound Salmon Enhancement Group (SPSSEG), and Joint Base Lewis-McChord (JBLM). In the absence of CalPortland, the advocate and sponsor for the Sequalitchew Creek Restoration Plan under the No Action Alternative would be SPSSEG.

1.1 Description of the Proposed Action

Consistent with 2012 Settlement Agreement discussed later, the South Parcel Project includes horizontal expansion of mining into approximately 188 acres previously undisturbed by mining, and vertical expansion of approximately 125 acres where re-mining will deepen a portion of the existing mine. The South Parcel Project would extend mining at the current rate for approximately 14 additional years.

The Proposed Action activities would be focused southeast of the existing Pioneer Aggregates Mine in DuPont, southwestern Pierce County, Sections 22, 23, and 26, Township 19 North, Range 1 East, of the Willamette Meridian (Figure 1). The Project is bordered to the north and west by the existing Pioneer Aggregates Mine; to the east by industrial and distribution facilities including Amazon, Dania, Pier 1 Imports, and FedEx; and to the south by Sequalitchew Creek and the Creekside Village residential development. The Project would occur on lands owned by Weyerhaeuser Company and leased to CalPortland.

The South Parcel Project includes mining within areas previously undisturbed by mining (termed the "Expansion Area") and mining deeper within a portion of the existing mine, referred to as the "Re-Mine Area." The Expansion Area is approximately 188 acres composed of three subareas (see Figure 2). The Kettle Area is a 10.8-acre previously undisturbed area. The 9.2-acre Buffer Strip is a

strip of vegetation that was retained along the inside of the originally permitted mine bordering the South Parcel. The South Parcel is 168 acres located southeast of the original mine and inside the Mineral Resource Overlay in the City of DuPont's adopted Comprehensive Plan.

The Re-Mine Area consists of 125 acres in the southeastern portion of the existing mine where current conditions limit the depth of mining activities. Lowering of the groundwater elevation would allow vertical expansion of the mine.

The South Parcel Project was developed consistent with a 2012 Settlement Agreement between CalPortland, the City of DuPont, the Washington State Department of Ecology (Ecology), and a coalition of environmental groups collectively referred to as the Environmental Caucus. The Settlement Agreement describes a process for a Restoration Plan for the Sequalitchew Creek watershed to be permitted and implemented contemporaneously with mining of the South Parcel. The Restoration Plan is designed "to help restore and enhance the Sequalitchew Creek watershed, including flows along the entire length of the Creek." The Restoration Plan is not intended solely as mitigation for the South Parcel Project, but the benefits of implementing the Restoration Plan will mitigate for the impacts of the mine. The Restoration Plan is described in Section 4.

1.2 Existing Mine

CalPortland's original sand and gravel mine was permitted in 1997 (355 acres). As provided under the Settlement Agreement, CalPortland applied for permits in 2013 for the North Parcel Mine Expansion to allow mining of approximately 142 acres within the North Parcel. Following the publication of a Final Environmental Impact Statement (EIS) in June 2013, the North Parcel mining expansion was permitted in 2014.

Mining activities at the existing site include mining, processing, transport of sand and gravel, and manufacturing of concrete. The processing area is located adjacent to the mine site on a 52-acre parcel owned by Glacier. Sand and gravel is removed from the mine by bull dozers and wheel loaders and transferred to the processing area by conveyor belts. At the processing facility, the material from the mine is crushed, washed, and separated into different size gradations. Aggregate products are stored in stockpiles in the processing area for distribution.

After completion of the production process, the majority of the finished aggregate products are transported from the plant area by conveyors and placed onto barges (approximately 80%) at Glacier's dock and barge loading facility at Tatsolo Point. The remainder (approximately 20%) is sold as aggregate or used to make concrete on-site; in both cases it is transported by truck.

Water used to wash gravel during processing is recycled through a clarifying process to remove silt and clay. This fine material is then run through a belt press to remove excess water and transported by truck and placed in holding cells in the mine, where it is allowed to dry for up to 3 years.

After drying, fines may be used to raise the floor of the mine by placing the material in cells separated by rock curtains to facilitate drainage. The material is placed in approximately 6-inch lifts and compacted to a material dry density of 90% (ASTM International [ASTM]:D-1557) or greater. Once filled to the desired height with fines from the belt press in this manner, a gravel cap of not less than 10 feet is placed over the compacted fines to mitigate potential for settlement and facilitate drainage.

1.3 Description of No Action Alternative

This document also evaluates the No Action Alternative. A No Action Alternative is required by SEPA. "No action" is interpreted to mean that the City would take no action on the mining proposal, but it does not necessarily mean that nothing would happen on the subject site.

Under the No Action Alternative, the South Parcel would not be mined but the property could be developed for manufacturing and research and residential uses under existing land use and zoning designations.

Portions of the South Parcel are zoned for Manufacturing and Research Park (MRP; 136.2 acres), Residential-4 (R-4; 16.1 acres), Residential Reserve (RR; 22.3 acres), and Open Space (OS; 3.8 acres). The MRP zoned areas are subject to restrictive covenants related to the Former DuPont Works Cleanup Site. These covenants restrict use of the property to industrial uses and, barring further remediation activities, would prevent re-zoning of the MRP areas.

The extent of development could vary considerably depending on zoning, density, and Project-specific and regulatory elements such as setbacks, open space, and critical areas. Areas zoned MRP would be available for development of up to 112 acres of light manufacturing and research. Buildings may be up to 65 to 70 feet tall, and there are no maximum lot coverage requirements other than those necessary to meet required setbacks (25 feet on the front property line, 15 feet on the sides and rear) and landscaping requirements (20% of lot area). Provision of 0.3 to 1 parking space per employee working at maximum shift is required.

Under the No Action Alternative, development would occur consistent with the City of DuPont Municipal Code (DMC) critical areas chapter (DMC 25.105), which could allow for development near the top of the Sequalitchew Creek ravine with a setback to be determined by a geotechnical engineer or engineering geologist.

The areas of the South Parcel zoned R-4 can be developed at a density of up to 4.5 single-family residences per gross acre,[1] resulting in a total of approximately 76 residences. An additional 4 single-

1 "Gross acre" means land designated for residential purposes in the Comprehensive Plan, inclusive of related streets and neighborhood parks (DMC 25.10.040).

family residences could be developed in the smaller portion zoned for RR density (one dwelling unit per 5 gross acres).

There would be no changes in the use of the areas of the South Parcel zoned for OS. These areas currently include the naturally vegetated slope of the Sequalitchew Creek ravine and the Sequalitchew Creek pedestrian trail.

A summary of the parcels, zoning, and development potential of the South Parcel is presented in Table 1.

Table 1
Parcels, Zoning, and Development Potential of the South Parcel

Parcel No.	Zoning	Parcel Area in Acres	Potential Development
0119262015	MRP	21.0	16.8 acres MRP
	OS	3.8	None
	Total	**24.7**	**16.8 acres MRP**
0119262016	MRP	34.1	27.3 acres MRP
0119233016	MRP	20.0	16.0 acres MRP
0119233017	MRP	20.3	16.3 acres MRP
0119233014	MRP	20.3	16.3 acres MRP
0119233015	MRP	20.5	16.4 acres MRP
0119233011	R-4	16.1	72 residences
	R-R	22.3	4 residences
	Total	**38.4**	**76 residences**

Note:
Potential development for MRP areas includes buildings, parking lots, and access roads, but not vegetated areas.

Under the No Action Alternative scenarios, there would be no change in use of the areas within the existing mine. However, once the Re-Mine Area is reclaimed, it would likely be redeveloped according to its underlying zoning, similar to the South Parcel.

The Kettle Wetland is within the existing mine and would remain intact, the buffers would remain vegetated, and mining operations would continue in other portions of the existing mine. The Kettle Wetland and its buffer would be subject to local and state wetland protection statutes, but other mine-related buffers could potentially be removed once the existing mine is reclaimed and redeveloped for future uses.

2 Affected Environment

The affected environment for the fisheries analysis is focused on the lower 1.4 miles of Sequalitchew Creek, and the estuary and brackish marsh near the mouth of the creek. Other affected environments addressed in this analysis include the Puget Sound nearshore north of the Nisqually flats to Tatsolo Point and potential fish habitat in the Edmond Marsh Complex. These areas are all outside the footprint of the South Parcel Project but are subject to potential indirect effects from Project-related changes to the Vashon Aquifer and the Restoration Plan.

The fisheries resources that exist within the proposed mine expansion area have been previously described in the *Pioneer Aggregates Mining Facility and Reclamation Plan Final EIS* (City of DuPont 1993). Additional sources of fisheries information consulted for this analysis include the following:

- *Summary of Cumulative Effects of DuPont Mining and Restoration Projects on Aquatic Habitat, Surface Water and Groundwater* (Aspect 2016)
- *Pioneer Aggregates Mining Expansion and North Sequalitchew Project Surface Water and Geomorphology Technical Report* (Herrera Environmental Consultants 2005a)
- *Fish Habitat Benefit Evaluation for Sequalitchew Creek: Pioneer Aggregates North Sequalitchew Creek Project* (Anchor Environmental 2004a)
- *Supplemental Report: North Sequalitchew Creek Project* (Anchor Environmental 2004b)
- *Salmonid Habitat Limiting Factor Analysis: Chambers-Clover Creek Watershed WRIA 12* (Runge et al. 2003)
- *A Twentieth Century History of Sequalitchew Creek* (Andrews and Swint 1994)

2.1 Sequalitchew Creek

A description of the Sequalitchew Creek watershed and the physical and biological habitat characteristics of Sequalitchew Creek is presented in the following sections. Additional description of the historical, existing, and predicted conditions of water quality and quantity records in this document can be found in the *Earth and Water Resources Report, DuPont Mine South Parcel Project* (Aspect 2022).

2.1.1 Sequalitchew Creek Watershed

Sequalitchew Creek (Water Resource Inventory Area 12-0019) drains a watershed covering approximately 38.4 square miles that discharges into Puget Sound (Runge et al. 2003). Figure 1 illustrates the characteristics of the Sequalitchew Creek drainage basin. Above the headwaters of Sequalitchew Creek is a cryptorheic[2] basin with headwaters located at river mile (RM) 9.6 in Kinsey Marsh on the east side of Interstate 5 (I-5). Kinsey Marsh flows drain to Murray Creek which flows 3.8 miles to American Lake on the west side of I-5. American Lake (1,162 surface acres) has no

[2] A crytorheic basin is a watershed that terminates where flow goes entirely subsurface.

defined outflow channel; however, there is a weir that maintains the maximum elevation of the lake water. On rare occasions, runoff from American Lake flows into Sequalitchew Lake (81 surface acres) but the frequency of surface flow is too low to form a defined channel between the two waterbodies (CH2M Hill 2003). A regional groundwater table maintains the water level in American Lake and Sequalitchew Lake (Andrews and Swint 1994).

2.1.2 Physical Habitat Characteristics of Upper Sequalitchew Creek

Sequalitchew Creek is largely an artificial channel from its source at the Lake Sequalitchew weir to the west end of West Edmond Marsh. This channel is excavated within the existing wetland complex and has extremely low velocity where it flows in a culvert under DuPont Steilacoom Road. Except under extreme high flow conditions, all flow that passes through that culvert either infiltrates or evaporates within the Edmond Marsh Complex. The Edmond Marsh Complex is described in detail in the *Plants and Animals Technical Report, DuPont Mine South Parcel Project* (Anchor QEA 2022). Descriptions of direct, indirect, and cumulative impacts to the Edmond Marsh related to the alternatives can also be found in that document.

2.1.3 Physical Habitat Characteristics of Lower Sequalitchew Creek

Sequalitchew Creek above RM 1.0 and below Edmond Marsh is typically dry. Only rarely is there a surface water connection between Edmond Marsh and Lower Sequalitchew Creek. There are no gage data for this reach, but analysis of the mid-ravine and lower ravine gages suggests that they are infrequent (maybe a handful over 19 years) and short lived (approximately 1 to 5 days). Most appear related to storm events, but some are from humans removing or altering the beaver dam at the west end of Edmond Marsh. The source of water in the lower mile of the creek is groundwater discharged from the Vashon Aquifer as springs in the Sequalitchew Creek ravine, below elevations of approximately 195 feet down to the top elevation of the Olympia Bed deposits at elevations between approximately 100 and 120 feet, spanning a creek reach of approximately 0.7 mile. Based on stream gaging data, this groundwater discharge to the creek varies between approximately 0.5 cubic feet per second (cfs) in the summer to 2.5 cfs in the winter. Progressing downstream past the Olympia Bed Truncation, Sequalitchew Creek becomes a losing stream as the water table drops through the outwash to near sea level (Aspect 2022).

The slope of the thalweg[3] ranges from about 2% to 3% in the ravine and the width of the stream varies from about 12 to 20 feet. Pebble counts of the streambed material were conducted at 21 stations. At 15 stations, the median gravel size (D_{50}) was between 0.5 and 1.5 inches. At the remaining 6 sites, the gravel was finer.

[3] The thalweg is the line connecting the lowest points of successive cross-sections along the course of a stream.

Sequalitchew Creek in the lower ravine has average annual flow of 2.8 cfs. The flows rises to between 3 and 4 cfs during the spawning periods for the salmonid species using the creek (Figure 5). During summer, flows drop and sometimes the creek dries up completely, leaving only small pools wetted (Runge et al. 2003). As a result, fish are unable to use the creek throughout the year, and aquatic invertebrate prey production is reduced (Bell 1991).

Comparison of recent flow monitoring results with earlier gaging efforts in 1977 to 1978 (Thut et al. 1978) and 1984 to 1987 (Firth 1991) indicates that the streamflow is about 38% to 55% lower now than it was in those periods. Average monthly flow rates near the mouth of Sequalitchew Creek are shown in Table 2.

Table 2
Average Flows in Sequalitchew Creek Watershed

	Average Flow in cfs				
	Diversion Weir	Mid-Sequalitchew Creek Ravine	Lower Sequalitchew Creek Ravine		
Month	2003 to 2021	2004 to 2021	1977 to 1978	1984 to 1987	1999 to 2021
January	15.6	2.5	9.7	5.9	4.0
February	19.6	2.6	12.8	8.5	4.2
March	21.5	2.2	12.2	8.7	3.8
April	19.8	2.0	0.7	9.4	3.2
May	12.7	1.6	1.6	7.8	2.7
June	7.4	1.2	1.5	3.7	1.9
July	3.2	0.9	0.2	1.3	1.3
August	2.8	0.8	0.1	1.0	1.1
September	2.4	0.8	0.1	1.0	1.1
October	3.7	0.8	0.1	1.4	1.4
November	7.1	1.3	2.4	3.7	2.6
December	10.9	1.9	10.5	5.1	3.5
Mean annual flow	10.5	1.6	4.3	4.8	2.7

Note:
All results are in cfs.

This change in flows in Lower Sequalitchew Creek was the result of actions upstream in Edmond Marsh. The Washington Department of Fish and Wildlife (WDFW) created a channel through Edmond Marsh around 1976. The purpose of the channel was to facilitate the use of Lake Sequalitchew in a fish augmentation program. The channel was maintained to prevent beaver dams and vegetation from raising water levels in the marsh. With higher water levels in Edmond Marsh, more water flows out the Diversion Canal and less flows toward Lower

Sequalitchew Creek. Maintenance of the channel was necessary to attract juvenile fish to migrate to Puget Sound via Edmond Marsh and the Sequalitchew Creek Ravine rather than the Diversion Canal. The route of migration through the marsh and ravine would have a much larger rate of survival as it would provide opportunities for growth and acclimation in the estuary. It is assumed that any fish migrating via the Diversion Canal would be killed or stunned by the drop to Tatsolo Point.

2.1.4 Biological Habitat Characteristics of Sequalitchew Creek

The Sequalitchew Creek drainage basin contains both anadromous and resident fish that occur at different times of the year and use different portions of the creek. Figure 3 shows the extent of documented anadromous fish use reported for Sequalitchew Creek within the Project area including coho salmon (*Oncorhynchus kisutch*), chum salmon (*O. keta*), and cutthroat trout (*O. clarkii*) (Runge et al. 2003; WDFW 2022). The U.S. Fish and Wildlife Service also identifies bull trout (*Salvelinus confluentus*), a threatened species, as occurring in the Project vicinity (USFWS 2003, 2022). Native bull trout populations are known to be present in the Nisqually River, whose mouth is located approximately 1 mile south of Sequalitchew Creek (Runge et al. 2003; SalmonScape 2022). Although suitable habitat for bull trout does not exist within Lower Sequalitchew Creek, it is likely that this species is present in the nearshore habitat and could enter Lower Sequalitchew Creek estuary to forage during salmon smolt out-migration.

Resident fish reported or expected to occur in Sequalitchew Creek within the Project area include cutthroat trout (*O. clarkii*), rainbow trout (*O. mykiss*), sculpins (*Cottus* sp.), and western brook lamprey (*Lampetra richardsonii*) (City of DuPont 1992; Wydoski and Whitney 1979). Other resident fish reported to occur in the Sequalitchew Creek drainage basin, but outside the Project area, include kokanee salmon (*O. nerka*) and spiny ray fish in American Lake and Sequalitchew Lake (Pierce County 1996). Chum salmon have been reported to spawn in the lower 650 feet of Sequalitchew Creek in the past (City of DuPont 1993).

2.1.4.1 Historical Augmentation of the Fishery

WDFW augmented the fishery of Sequalitchew Creek intermittently from 1980 to 2001. Coho salmon smolts were released into Sequalitchew Creek from 1980 to 1994 and again in 2001. The annual number of coho salmon smolts released ranged from 2,280 to 987,480 with an average annual release of 238,477. These smolts were released in the spring (March 25 to May 31) between 1980 and 1994, and during the winter (December 11) in 2001. Fall Chinook salmon (O. *tshawytscha*) smolts were also released into Sequalitchew Creek in 1990 and 1991. These smolts were released in the spring (April 2 to 16) in numbers that ranged from 19,800 to 42,800 with an average annual release of 27,533. Coho salmon, chum salmon, and cutthroat trout are currently reported to utilize Sequalitchew Creek according to the most recent information from WDFW (SalmonScape 2022) and the *WRIA 12 Salmonid Habitat Limiting Factors Report* (Runge et al. 2003).

Coho salmon spawning survey records for Sequalitchew Creek indicate sporadic observations have been made by WDFW in 1962, and between 1982 and 1985. These surveys conducted in the winter (November 6 to December 27) extended from the mouth to RM 1.6. These data indicate that the annual number of adult coho salmon observed ranged from 0 to 145 with an annual average of 22. These surveys occurred during the period when smolts were released in the watershed, and flows were maintained by cutting a channel through Edmond Marsh.

The time of year when anadromous fish are reported to occur in Sequalitchew Creek within the Project area is as follows: Coho salmon smolts out-migrate from March to May, while returning adults spawn from late November to early January. Chum salmon spawn between December and February, and the fry out-migrate immediately after emerging from the gravels, which is usually between March and June (WDF 1975). Resident and sea-run cutthroat trout reside in Sequalitchew Creek throughout the entire year. Adults typically spawn in the spring and summer (February to August) and the fry emerge in late summer. Adult bull trout can potentially be present in the lowest portions of Sequalitchew Creek at any time of the year but are most likely to enter the stream to forage on out-migrating salmon smolts between March and June. Bull trout are not expected to use Sequalitchew Creek for spawning purposes due to the limited known distribution in the vicinity and the lack of spawning conditions that bull trout require (Runge et al. 2003).

2.1.4.2 Fish Habitat Under Existing Flows

Anchor Environmental (2004a, 2004b) completed an analysis of salmonid spawning and passage in Sequalitchew Creek based on water depth and flow. The analysis was conducted for coho salmon, chum salmon, and cutthroat trout. The Toe-Width Method and the Stage Discharge Analysis methods were combined to characterize the existing stream habitat. The Toe-Width Method provides a calculation for optimal flow conditions in cfs for the stream and uses data on the physical characteristics of the stream channel to estimate the streamflow that provides the maximum habitat for salmonid spawning and rearing. The Stage Discharge Analysis provides an analysis of minimum flow conditions for a given life stage. Both approaches utilize WDFW-developed and approved formulas.

The Toe-Width Method results indicate that optimal flows for both spawning and rearing in Sequalitchew Creek would be higher than current flows (Anchor Environmental 2004a). A discharge of 2.5 cfs was used in the analysis. This flow is representative of flows in a drier-than-average year during coho and chum salmon spawning. Based on a period of record from 2000 to 2001, the measured average flow during November, December, and January was 3.4 cfs (standard deviation of 2.0 cfs). At a discharge of 2.5 cfs, the lower reaches of Sequalitchew Creek provide unsuitably low depths for adult chum salmon passage and spawning, and unsuitably low depths for adult coho salmon passage and spawning. At a discharge of 2.5 cfs, depths are generally adequate to support resident cutthroat trout rearing and spawning. The monthly mean of flows for the driest month in each year (2000 to 2021)

averaged approximately 1 cfs, and there were many months when the average flow was 0.3 cfs or less. Cutthroat trout habitat would be severely limited during these periods.

A later study was conducted by ICF International (ICF 2013) using the Ecosystem Diagnosis and Treatment (EDT), a fish life-cycle habitat model that characterizes the aquatic environment temporally (monthly) and spatially (stream reaches). The model was run for both chum and coho salmon. This study found that, "habitat potential for the current condition suggests that Sequalitchew Creek could support a small quantity of natural chum salmon. However, the number of fish and productivity suggests the stream cannot support an independent population and is likely not self-sustaining" (ICF 2013). For coho salmon, the study found that the under current conditions, "adult capacity and abundance is essentially zero" (ICF 2013).

2.2 Marine Shoreline Description

Fish habitat along the marine shoreline at the mouth of Sequalitchew Creek and the barge loading facility has been previously described (City of DuPont 1993, 1995). A description of these physical and biological habitat characteristics, along with additional information collected for this study, are presented in the following sections.

2.2.1 Physical Habitat Characteristics of the Marine Shoreline

2.2.1.1 Mouth of Sequalitchew Creek

The Puget Sound shoreline at the mouth of Sequalitchew Creek is characterized by an armored slope above a gravel beach with minimal estuarine habitat. Farther offshore, a shallow soft sediment bench extends from the Nisqually River delta to just north of the mouth of Sequalitchew Creek. The BNSF railroad tracks paralleling the shoreline in this area are perched on a steep riprap berm. On the Case Inlet side of the railroad there are gravel deposits on either side of the mouth of Sequalitchew Creek that extend above the high tide line. These create more complete nearshore habitats, with beach grasses, drift logs, and low angle beaches extending into the subtidal zone. The railroad berm bisects the mouth of Sequalitchew Creek and influences tidal currents, wave action, and sediment deposition along the marine shoreline. There is a brackish marsh associated with Sequalitchew Creek on the upstream side of the railroad berm. Wind waves and tidal flows in the marsh are limited by a culvert under the railroad berm. The culvert draining Sequalitchew Creek through this railroad berm influences tidal exchanges, deltaic sediment deposition, and fish passage. There is limited rearing habitat in the brackish marsh on the upstream side of the railroad berm because this berm does not allow the channel to meander and otherwise naturally braid into multiple tidal channels. The loss of these natural processes limits the quantity and quality of fish habitat in this estuary.

2.2.1.2 Marine Shoreline West of the Existing Mine

The shoreline on the Puget Sound side of the railroad berm also has limited fish habitat because the steep slope influences wave action, sediment deposition, and estuarine vegetation. Waves formed by the predominant wind direction (from the southwest) break on the riprap-lined slope during high tides and do not allow for the deposition of fine-grained substrate in most areas. Substrate along the shoreline that is influenced by high-energy waves and wave reflection scouring is dominated by cobbles and gravel. In addition, the steep riprap embankment does not allow estuarine vegetation to grow above the high tide line. This limits the organic export of nutrients and benthic invertebrates that juvenile salmonids need during their acclimation to estuarine conditions. Within about a quarter mile on either side of the mouth of Sequalitchew Creek there is an accretionary sand bar at the shoreline. This sandbar reduces wave energy and scour. The sandier substrate off shore of the bar supports patches of eelgrass (*Zostera marina*; Ecology 2022). The bottom substrate farther offshore that is not influenced by wave scouring consists of fine-grained sediment overlying cobbles.

2.2.1.3 Barge Loading Facility

The Puget Sound shoreline at the Pioneer Aggregates barge loading facility near Tatsolo Point has previously been described in the Pioneer *Aggregates Barge Loading Facility and DuPont Shoreline Master Program Amendment—Supplemental EIS* (City of DuPont 1995). This shoreline is located where the BNSF railroad tracks also parallel the shoreline. The railroad tracks are perched on a steep berm composed of riprap that occupies the intertidal zone to nearly mean lower low water (MLLW) meaning there is little intertidal beach present. This railroad berm influences tidal currents, wave action, and sediment deposition along the marine shoreline. Although there is a gravel beach adjacent to the railroad berm approximately 200 feet north of the dock, the area has minimal nearshore habitat value.

The shoreline on the Puget Sound side of the railroad berm has limited fish habitat because the steep slope influences wave action, sediment deposition, and estuarine vegetation. Waves formed by the predominant wind direction (from the southwest) break on the riprap-lined slope and do not allow for the deposition or effective transport of fine-grained substrate. Substrate along the shoreline is influenced by high-energy waves and wave reflection, which scour away finer material leaving only cobbles and coarse gravel above -4 feet MLLW. In addition, the steep riprap embankment does not allow estuarine vegetation to grow above the high tide line. This limits the organic export of nutrients and benthic invertebrates that juvenile salmonids need during their acclimation to estuarine conditions. The bottom substrate farther offshore that is not influenced by wave scouring consists of coarse, sandy sediment overlying cobbles. Fine sand and silt gradually replace the coarser sediment until about -25 to -35 feet MLLW. Below this depth the sediment is predominantly silt and fine sandy mud (City of DuPont 1995).

2.2.2 Biological Habitat Characteristics of the Marine Shoreline

The reach of Case Inlet west of the existing mine and the nearshore from the mouth of Sequalitchew Creek are habitat for numerous species of fish and marine invertebrates. WDFW Priority Habitats and Species mapping documents the presence of key habitats for cutthroat trout, coho salmon, and chum salmon migration and rearing; and Pacific sand lance (*Ammodytes hexapterus*) and surf smelt (*Hypomesus pretiosus*) breeding. The reach is used by Dungeness crab (*Cancer magister*) and various genera of pandalid shrimp. Kelp and algae beds are present in the shallow subtidal, and there have been limited observations of eelgrass in the vicinity.

2.2.2.1 Mouth of Sequalitchew Creek

Although fish habitat along the marine shoreline at the mouth of Sequalitchew Creek is influenced by the railroad berm, this area is still used by a variety of species (City of DuPont 1993). These include plants and invertebrates in the intertidal and subtidal zones, as well as the marine and diadromous fish species described below.

Prior studies indicate that 75 plant species were found growing on the bottom substrate in the intertidal area (0 to 9 feet above MLLW). Of these intertidal plants, more than half were red algae (Rhodophytes) and green algae (Chlorophytes). The majority of the subtidal plants were found between 0 and -16 feet below MLLW. Small patches of eelgrass in sparse densities were observed near the mouth of Sequalitchew Creek (City of DuPont 1993).

Prior studies also identified 270 species of invertebrates in the intertidal area, with the majority of these species occurring near 0 feet MLLW (City of DuPont 1993). Several species of limpets, barnacles, and periwinkles were the dominant molluscan groups. The most productive area was the lower intertidal area near the mouth of Sequalitchew Creek. Subtidal invertebrates found in this area include snails (gastropods), worms (polychaetes), sea stars, and amphipod crustaceans.

Marine fish observed along the shoreline in this area include 31 species of bottomfish, 26 species of bottom-dwelling (demersal) fish, and 11 water-column (pelagic) species (City of DuPont 1993). The predominant bottomfish include English sole (*Parophrys vetulus*), rock sole (*Lepidosetta bilineata*), and starry flounder (*Platichthys stellatus*). The dominant demersal fish include buffalo sculpin (*Enophrys bison*), Pacific tomcod (*Microgadus proximus*), staghorn sculpin (*Leptocottus armatus*), rockfish species (*Sebastes* spp.), cabezon (*Scorpaenichthys marmoratus*), painted greenling (*Oxylebius pictus*), and pipefish (*Syngnathus griseolineatus*). The pelagic fish are represented by shiner perch (*Cymatogaster aggregate*), surfperches (Embiotocidae), and tubesnout (*Aulorhynchus flavidus*).

Salmonid species observed along the marine shoreline include coho, chum, Chinook, and pink salmon (City of DuPont 1993). Adult coho salmon were found along the shoreline at the Sequalitchew Creek mouth in September and October, but most of these fish were returning to

spawn in the Chambers Creek, McAllister Creek, and Nisqually River watersheds. Returning chum salmon are found along the shoreline at the Sequalitchew Creek mouth in December and January, but most of these fish spawn in the Nisqually River. Chinook and pink salmon observed along the marine shoreline are mainly migrating to the Nisqually River system.

Juvenile salmonids are found along the shoreline at the Sequalitchew Creek mouth during the spring out-migration, but many of these fish originate in the Nisqually River. Juvenile coho salmon are typically found between May and June. The peak migration of juvenile chum salmon occurred between mid-February and late July. Juvenile Chinook salmon were observed migrating from late May to July.

As noted previously, a native population of bull trout is known to inhabit the Nisqually River system (Runge et al. 2003; SalmonScape 2022). Fish from this population may utilize the nearshore environment near the mouth of Sequalitchew Creek and may also enter the lowest portion of the creek to forage on juvenile salmonids.

2.2.2.2 Barge Loading Facility

Habitat along the marine shoreline at the barge loading dock has previously been described in the *Pioneer Aggregates Barge Loading Facility and DuPont Shoreline Master Program Amendment—Supplemental EIS* (City of DuPont 1995). Like the area described at the mouth of Sequalitchew Creek, both areas are influenced by the railroad berm. However, the barge loading dock area has less diversity than the mouth of Sequalitchew Creek. The following provides a summary of the plants and invertebrates in the intertidal and subtidal zones; marine fish; and salmonids found in this area.

An intertidal flora and fauna survey conducted approximately 200 yards south of the barge loading dock in 1978 found little macroalgae above +6 feet MLLW. Only rockweed (*Fucus gardneri*) was present at +6 feet MLLW. At lower elevations, several species of red and green algae were common, and at 0 feet MLLW, several species of kelp dominated. Periodic bathymetric surveys have not detected significant material spills.

Subtidal plants are distributed at various depths and include macroalgae and kelp at around -8 feet MLLW. A narrow band of bull kelp (*Nereocystis leutkeana*) extends along the shoreline in both directions from the barge loading dock. Algae species are restricted to the area above -20 to -30 feet MLLW, and the most prevalent algae species was sea lettuce (*Ulva lactuca*). Ribbon kelp (*Laminaria saccharina*) was the second most common algae in this area. A variety of filamentous and foliose red algae species are present; the most common is *Sarcodiotheca gaucichaudii*. The cumulative percent cover of these algae ranged from 100% in the shallow subtidal zone to less than 5% at -20 to -30 feet MLLW. No eelgrass beds were observed in the vicinity of the dock.

Subtidal animals living within (infauna) and on top (epifauna) of the sea bed are present at various depths. The most common infauna group is polychaete worms, while the epifauna is dominated by shrimp and crab species. Larger animals included cockles (*Clinocardium nuttallii*), sea cucumbers (*Parastichopus californicus*), several species of sea stars, Dungeness crab (*Cancer magister*), rock crab (*Cancer productus*), and geoducks (*Panope abrupta*).

Marine fish observed along the shoreline in this area include shiner perch, Pacific herring (*Clupea harengus pallasi*), sand dab (*Citharichthys sordidus*), English sole, and starry flounder. Four salmon species (coho, chum, chinook, and pink) are expected to occur in this area. However, this area is less productive for juvenile salmon rearing and adult migration than the mouth of Sequalitchew Creek due to its greater distance from the Nisqually River. As noted previously, a native population of bull trout is known to inhabit the Nisqually River system (Runge et al. 2003). Fish from this population may utilize the nearshore environment in the vicinity of Sequalitchew Creek, including the barge loading facility.

3 Impacts of the Proposed Action and No Action Alternative

3.1 Impacts of the Proposed Action

This section is divided into two parts: direct impacts, which are directly related to the actions in the South Parcel Project Area; and indirect impacts, which are associated with aquifer drawdown outside the South Parcel Project Area (see Figure 2).

3.1.1 Direct Impacts of the Proposed Action

The Proposed Action would directly affect fish habitat by extending the operation of the marine barge loading dock within the marine shoreline. This would prolong shading beneath the facility, which can inhibit macroalgae growth and epibenthic productivity. These would have a small effect on the overall availability of nutrients for fish. The proposed mine expansion would extend by about 14 years the period when the barge loading dock continues to be used to transport aggregate to market. Fisheries impacts (e.g., shading, spill risk) associated with use of this barge loading dock have previously been described in the *Pioneer Aggregates Barge Loading Facility and DuPont Shoreline Master Program Amendment—Supplemental EIS* (City of DuPont 1995) and a previous *Fisheries Technical Report* (Herrera 2005).

Potential fisheries impacts to the marine shoreline include direct and indirect effects from the spillage of sand and gravel from the conveyor, overturning of barges during loading, accidental spills of pollutants, shading, and lighting, and are summarized as follows:

- Sand and gravel spilled in sufficient quantities could smother the benthic community where the spill occurs.
- Accidental spills of petroleum products (diesel) and other pollutants (hydraulic oil) could potentially occur during barge loading and maintenance activities.
- Extending the life of the conveyor and barge loading dock by about 14 years would extend any impacts to areas directly beneath the dock by shading the shallow water, as well as impacts associated with dock lighting. These impacts would occur until the dock is eventually removed.
- Ecology maintains a record of all reported oil spills of 1 gallon or more. These records go back to 2015. There were no recorded spills in the vicinity during that time (Ecology 2023).

3.1.2 Indirect Impacts of the Proposed Action

The Proposed Action would not directly affect Sequalitchew Creek, but the drawdown of the Vashon Aquifer would indirectly reduce flow in Lower Sequalitchew Creek. Lower Sequalitchew Creek is entirely spring fed (as described in Section 2.1.3). Groundwater discharge to Sequalitchew Creek during active dewatering is predicted to be 79% less than baseline conditions, on average, resulting

in a decrease in average flow in Sequalitchew Creek from 1.6 cfs to 0.34 cfs at the mid-ravine gage. The greatest decrease would occur during the wet season.

Without restoration, these indirect impacts would reduce flows during the spawning life stage of chum salmon and the spawning and rearing life stages of coho salmon and cutthroat trout. Impacts during the spawning season would be severe: seriously limiting the amount of habitat for resident cutthroat trout and eliminating spawning habitat for anadromous species. This would reduce the spatial extent of habitat available and reduce the portion of the year when fish habitat is accessible.

3.2 Impacts of the No Action Alternative

Under the No Action Alternative, the condition of the Sequalitchew Creek fish populations and fish habitat would remain similar to existing conditions. Suitable and accessible habitat for all species of fish currently and historically present would continue to be a fraction of what they were a few decades ago. Surface flows from Edmond Marsh into Lower Sequalitchew Creek would continue to occur during extreme precipitation events and would not contribute meaningfully to habitat. The creek would continue be unused or used very little by chum and coho salmon and cutthroat trout.

4 Cumulative Effects of Proposed Action and Restoration Plan

The South Parcel Project, described in Section 1.2, includes implementation of the Restoration Plan, reflected in the 2012 Settlement Agreement and developed by CalPortland and the Environmental Caucus. The Restoration Plan, which is a related action, seeks to restore and enhance streamflow and ecological functions from Sequalitchew Lake through Edmond Marsh into Sequalitchew Creek ravine. The Restoration Plan is intended to sequentially restore diverted flows back to the creek, improve the sustainability of flows through the system, and restore aquatic habitat by removing flow-related fish passage barriers and increasing the habitat available to aquatic species.

This section identifies what is currently known about the cumulative effects of the Proposed Action and the Restoration Plan. The Restoration Plan is being designed and permitted independently, and the specific impacts of the plan will be evaluated in those documents. Since the effects of the restoration will be evaluated in a subsequent SEPA document, these conclusions should be framed as general and preliminary. A cumulative effects analysis is an evaluation of the combined effects on biological resources for the Proposed Action, including the effects of reasonable and foreseeable development projects in the vicinity of the study area. One such set of reasonable and foreseeable effects would be from the cumulative impacts of continued growth in the region. These will occur regardless of whether or not the Project occurs. The other set of reasonable and foreseeable effects on Sequalitchew Creek, the marine nearshore, and wetlands is the impacts of the Restoration Plan. This analysis of impacts is based on the current understanding of the Restoration Plan actions being carried out by JBLM, SPSSEG, or others. These actions may change as they are being further designed and permitted. Therefore, much of this analysis is based on the restoration targets of the plan, such as increased flows in Sequalitchew Creek.

4.1 Benefits

The cumulative effects of the mining and full implementation of the Restoration Plan for the Sequalitchew Creek watershed would reverse many of the adverse impacts to the watershed and creek that have occurred over decades. The benefits would be noticeable over a large portion of the stream and wetland habitats in the basin and would largely restore lost and reduced ecosystem functions including the movement of water, sediment, nutrients, biota, and dissolved gasses through the watershed from the headwater springs on Sequalitchew Lake to Puget Sound. The reconnection of Sequalitchew Creek to its historical primary source of flow, Sequalitchew Lake, would address the root cause of the primary historical impacts to the system.

These projects cumulatively have the potential to restore an annual average of 10.8 cfs to a 1,200-foot reach of Sequalitchew Creek that currently experiences little to no consistent flow. Seasonally, the flows in this reach following restoration are predicted to be between 2.2 cfs in August up to just over 22 cfs in March. Flows of this magnitude would re-establish a functioning stream in the now frequently dry

channel, providing new aquatic and riparian habitat and a connection between the Sequalitchew Creek ravine and the marshes. This would provide a corridor for both aquatic and terrestrial species and would provide new opportunities for species expansion and recovery.

In the Sequalitchew Creek ravine, the restoration and mining projects would result in a seven-fold increase in flow on an annual average basis, from the current 1.6 cfs up to 11.2 cfs. Peak flows could reach up to 60 cfs, sufficient to restore the natural channel-forming processes necessary to improve habitat conditions in the ravine. Currently, the flows in the ravine are inadequate to move sediment effectively, create pools, or scour finer-grained materials from the substrate to create conditions suitable for spawning. Peak flows could be adaptively managed by adjusting the weir at the Diversion Canal and limiting flow through Edmond Marsh to prevent flooding or detrimental effects to the wetlands or the stream channel.

The restoration project would also restore fish passage from Sequalitchew Creek to East and West Edmond Marshes. Two fish barrier culverts will be replaced by fish-passable structures, which in combination with increased flows will allow migratory access above the ravine springs and into Edmond Marsh. Restoration would affect the conditions sufficiently to allow establishment of emergent vegetation in the western extent of the complex where inundation will persist through more of the growing season, providing excellent rearing habitat for juvenile coho salmon and cutthroat trout. These effects would increase the size, diversity, and complexity of available fish habitat types.

The greatly increased flow through Edmond Marsh would also improve water quality conditions by increasing dissolved oxygen concentrations and diluting and flushing an area of elevated iron concentrations in the center of the marsh.

4.2 Impacts

The greatest potential impacts to fish associated with restoring the natural flow regime to the Sequalitchew Creek watershed would be increased summer stream temperatures, and increased frequency of periods of high flow in winter and spring. These impacts will be mitigated through adaptive management by the restoration implementation team. These same impacts would occur with or without the change in groundwater elevation resulting from mining. Summer low flows below the Sequalitchew Creek Ravine Springs would be reduced during prolonged dry summers. At all other times, the benefits of increased flow would not be affected by lower groundwater.

The implementation of the Restoration Plan would result in water levels in Sequalitchew Creek Marsh and Edmond Marsh that are more consistent with conditions when the Diversion Canal only flowed during severe precipitation events. That change would also result in a loss of current wetland area

and, likely, a return to the shape and extents of the marsh in the 1970s. See the accompanying *Plants and Animals Technical Report* (Anchor QEA 2022) for more discussion of wetland impacts.

The flow from Sequalitchew Lake is also warmer in summer than the current flow in the ravine. The Project effects would represent a return to a more natural, surface-flow-dominated condition, but one with warmer stream temperatures. Sequalitchew Creek would experience temperatures up to 21°C in June, July, and August and cool temperatures down to 5°C in winter. The seasonal pattern of average monthly temperatures in Sequalitchew Creek with mining and restoration are shown in Figure 4. The predicted stream temperatures would be considerably warmer than the current spring discharge in the creek for most of the year. The surface water quality criterion for temperature applicable to Sequalitchew Creek is 16°C for the 7-day average of daily maximums. The analysis based on grab samples suggests this threshold may be exceeded from May through September.

Finally, there are predicted to be infrequent periods when the mining and restoration projects would result in streamflows that are lower than currently occur. This condition would occur during extended dry periods, when outflow from Sequalitchew Lake is naturally low or non-existent. Streamflows would be lower than existing conditions about 10% of the time, typically in August and September of particularly dry years. Existing flows during these periods currently average 0.83 cfs and do not provide aquatic habitat for anadromous fish; mining and restoration would further reduce these flows during these periods (to 0.44 cfs). This means that fish in the system below Edmonds Marsh will have less habitat as the population moves downstream to the remaining channel area.

4.3 Cumulative Effects for Fish Habitat in the Watershed

The combined effects of the mining and restoration projects on stream habitat would include a re-establishment of flow from Sequalitchew Lake to flow through the marshes and into Sequalitchew Creek ravine. The projects would also result in re-establishing ecosystem processes, specifically, the movement of water, sediment, nutrients, biota, and dissolved gasses through the watershed from the headwater springs on Sequalitchew Lake to Puget Sound. The increase in hydrology and stream energy would increase aquatic ecosystem productivity and create and maintain habitat diversity.

Re-establishment of peak flows and the associated sediment movement is key to restarting the arrested habitat-forming processes downstream of Edmond Marsh and is a key objective of the Restoration Plan. Currently, even where flows persist perennially, they are inadequate to move sediment effectively, create pools, or scour finer-grained materials from the substrate to create conditions suitable for spawning. The input of sediment and organic matter will stimulate biological productivity and develop greater resources at the lower trophic levels. Restoration would also result in pool and riffle habitat formation over time.

This habitat and development of lower trophic productivity are key to developing conditions sufficient to restore target species such as chum salmon and cutthroat trout in the system. Chum salmon will also benefit from the restoration of a more varied hydrograph. Puget Sound stocks typically spawn in freshwater systems in November and December as flows rise in response to winter rains. This effect has been limited in the system due to the current lack of surface water connectivity.

Previous studies by Anchor Environmental (2004a) and ICF (2013) showed that additional flow would result in increased capacity of the stream to support spawning and rearing of coho and chum salmon. These studies pre-date the completion of the Restoration Plan, but both approaches used predicted flow restoration scenarios similar to flows resulting from the cumulative effects of mining and restoration. The Anchor Environmental (2004a) study analyzed the effects of higher flows in the lower ravine within the lower 3,600 feet of the stream (not the upper ravine). The report concluded that additional flow in the lower reaches of Sequalitchew Creek would "provide significantly enhanced habitat conditions to support coho and chum salmon and cutthroat trout. Existing conditions in Lower Sequalitchew Creek indicate the habitat potential is significantly suppressed, and opportunities for salmon to access and use stream habitat is also very limited. Habitat features exist (e.g., appropriate spawning gravel, LWD and SWD, limited physical barriers) that will provide conditions important for coho and chum salmon and cutthroat trout spawning and rearing with more water present in the stream channel." The ICF (2013) study found that restoring chum access to lower gradient reaches of Sequalitchew Creek near the midpoint of the ravine "is predicted to improve overall productivity and nearly double abundance from the current condition."

4.3.1 Water Quality

The mining and restoration projects would introduce surface water from the upper watershed to the creek. Water passing through Edmond Marsh has low levels of turbidity and pollutants (Aspect Consulting 2022). The projects will affect stream temperature in the Sequalitchew Creek ravine by restoring the flow of surface water in the system which has a different temperature. The effects would vary seasonally as the volume of water from Sequalitchew Lake and its associated temperature vary. In summer, the outflow from Sequalitchew Lake is warmer than Sequalitchew Creek; in winter, it is colder.

Sequalitchew Creek would experience warm temperatures in June, July, and August, with temperatures reaching up to 21°C (70°F) and cool temperatures in winter, down to 5°C to 6°C (41°F to 43°F) as shown in Figure 6. The predicted stream temperatures would be considerably warmer than the current spring discharge in the creek for most of the year. The surface water quality criterion for temperature applicable to Sequalitchew Creek is 16°C for the 7-day average of daily maximums. The analysis based on grab samples suggests that this threshold may be exceeded from May to September.

This temperature increase may have the potential to alter habitat for juvenile fish present. Increased stream temperatures have been shown to decrease time to emergence in several salmonid species, including coho salmon (Quinn 2005). Cutthroat trout, which spawn and rear later in the season, have been shown to hatch earlier as temperatures increase (Quinn 2005). Although sub-lethal, this temperature increase may impact growth and survival, with juveniles potentially competing for resources earlier in the year (Anlauf-Dunn et al. 2022; Leach 2012; Quinn 2005).

Historically, the stream temperatures in Sequalitchew Creek were likely closer to those observed today in the lake outflow. The steady, cool temperatures currently observed in the ravine reflect the proportionally greater input of groundwater resulting from diversion of the lake outflow from the system.

The dissolved oxygen levels in Lake Sequalitchew and Lower Sequalitchew Creek are high (>9 milligrams per liter [mg/L]). Water quality in the marshes is more typical of stagnant waterbodies exposed to the life cycle of aquatic plants. Dissolved oxygen concentrations are lower (typically <4 mg/L) and are predicted to be raised with the addition of water flowing more rapidly through the system.

4.3.2 Water Quantity

The cumulative effect of the mining and restoration projects on streamflow was evaluated and streamflows were predicted at two locations (Aspect 2022). These locations are the dry reach near Center Drive, and in Sequalitchew Creek at the mid-ravine gage.

4.3.2.1 Flows in the Dry Reach

Under existing conditions, the dry reach currently experiences no consistent flow passing through the entire reach. The bottom of the dry reach is above the current groundwater levels, so ground infiltration in the dry reach would not be affected by lowering of groundwater with mining.

The mining and restoration projects are predicted to result in an average flow of 12.6 cfs in the dry reach. The flow would vary seasonally from a monthly average of 2.5 cfs in August to 25.7 cfs in March as shown in Figure 5. Peak flows could be as high as 65 cfs if all water is routed through the wetlands during peak flow events. To avoid flooding during peak flows, the highest flows could be directed to the Diversion Canal or detained in the marshes. The results presented here do not account for the diversion of peak flows or detention in the marshes.

Modeling indicates there would be periods when there would be no outflow from West Edmond Marsh, and thus no flow in the dry reach. These occur on 401 days of the 19-year period of record (or 7.7% of the time) and typically occur in July and August. These periods last for multiple weeks and occurred in 5 of the 19 years simulated (2004, 2005, 2015, 2017, and 2018). The occurrence of these dry periods could be reduced or eliminated if beaver management structures are built to store water and release it slowly and consistently during periods when there is no flow from Sequalitchew

Lake. Should flow be disrupted, it would temporarily disrupt the habitat and migratory functions of the stream reach between the Sequalitchew ravine springs and Edmond Marsh.

4.3.2.2 Flows in Sequalitchew Creek at Mid-Ravine Gage

After passing through the dry reach, streamflows would enter the Sequalitchew Creek ravine. The vast majority of flow would originate from Sequalitchew Lake, but there would be contribution from springs within the ravine, although the contribution from these springs would be lower than it is under existing conditions.

Spring flow in the upper reaches of the Sequalitchew Creek ravine would be affected by the lowered groundwater levels associated with mining. The groundwater model results for active dewatering, and the long-term condition that would persist after active dewatering has ceased, predict a reduction in spring flow of 79%, varying from 73% in January to 86% in summer.

On average, flow in Sequalitchew Creek at the mid-ravine gage would generally be similar to but slightly higher than the flows in the dry reach (i.e., 0.4 cfs greater), reflecting the input of spring flow. The annual average flow at the mid-ravine gage would be 12.9 cfs. Monthly average flows would range from 2.5 cfs in August to 26.3 cfs in March as shown in Figure 6. Peak flows would be generally the same magnitude (approximately 65 cfs) as in the dry reach.

There would be periods when the cumulative effects of the mining and restoration projects would result in a reduction in flows at the mid-ravine gage when compared with the existing condition. Of the 19 years evaluated, flows would be lower with the projects during 45 periods, lasting a total of 475 days, or about 10.% of the time. Included in this tally are 24 days when there would be no flow at the mid-ravine gage. Under existing conditions, there were 7 days with no measurable flow at the gage. As noted previously, these effects could be mitigated in part or in whole by careful implementation of the beaver management actions called for in the Restoration Plan.

The median duration of a period when flows would be lower with mining and restoration (hereafter referred to as a "lower flow event") was 3 days, but there were seven lower flow events lasting more than 2 weeks. The longer events occurred in 6 of the 19 years simulated (2004, 2005, 2015, 2016, 2017, and 2018). The longest single lower flow event was 98 days, ending in October 2017. However, lower flow events dominated the summer and fall of 2005, when there were four lower flow events between July 20 and December 23 lasting a total of 134 days. Lower flow events occurred most commonly in July, August, and September, but occasionally occurred all months except March. The average streamflow during lower flow events was 0.83 cfs under existing conditions and would be 0.44 cfs with mining and restoration. The decrease in streamflow during lower flow events ranged from 0.1 cfs up to 1.6 cfs. Again, these effects could be mitigated in part or in whole by careful implementation of the beaver management actions called for in the Restoration Plan.

4.3.3 Edmond Marsh

An aspirational goal of the Restoration Plan is to reintroduce a sustainable population of coho salmon. If successful, the aquatic area of West Edmond Marsh will provide excellent rearing habitat for juveniles. Juvenile coho salmon typically stay in freshwater wetlands and small streams for 2 years or more after spawning.

4.3.4 Nearshore Habitat

The additional flow in Sequalitchew Creek will transport more nutrients and fine sediment to the nearshore. The mouth of the creek is near the south end of a drift cell with net transport to the north. The additional sediment would benefit the nearshore by replacing some of the sediment that would naturally come from the exposed bluffs above the railroad. Currently this sediment cannot cross the tracks, and the lower shoreline is heavily armored, preventing erosive forces from recruiting sediment below the railroad. Additional nutrients and sediment will also increase biotic productivity on the Puget Sound shoreline at the mouth of the creek, increasing prey resources for fish. Conditions in the brackish marsh are expected to remain stable. Although salinity at the surface may drop, the saltwater wedge that enters the marsh at high tide will still cover the entire vegetated surface of the marsh.

5 Monitoring and Mitigation Measures

Specific mitigation measures associated with dewatering and other aspects of the mining project are discussed in the Groundwater Section of the Earth and Water Resources Report (Aspect 2022).

Existing mitigation measures at the barge loading facility at Tatsolo Point will continue. The facility is designed in accordance with adopted federal, state, and local regulations and guidelines to reduce the likelihood of spills of lubricants, fuels, and chemicals employed in the processing and manufacturing processes proposed for the site. The overwater portion of the conveyor shall be enclosed to prevent spillage of gravel. The dock is not used for the delivery of supplies, or chemical or other materials by water; a spill plan has been prepared for all elements and operations of the facility (marine and upland). Appropriate oil spill containment equipment is available at the dock site.

Mining operations will continue to manage fugitive dust, and forested buffers around Sequalitchew Creek will remain to protect water quality. Site water and stormwater is recycled and/or infiltrated in the mine, eliminating turbid runoff. During construction of the mitigation wetland and other excavation of soils, construction best management practices will be used to prevent erosion of soils.

The restoration and mining projects both include monitoring and adaptive management programs aimed at ensuring the projects achieve their objectives. A main purpose of ongoing monitoring and adaptive management is to look for detrimental cumulative effects and, if identified, adaptively respond to minimize them.

The adaptive management process is built around the following five steps:

1. Assess
2. Design
3. Implement and monitor
4. Evaluate
5. Adjust

The process is iterative and would continue throughout the projects. Adaptive management plans are in development for each project and will be incorporated into the Restoration Plan and Monitoring Plan.

Monitoring will include continued collection of groundwater and surface water observations at the existing monitoring network, as well as the installation of new monitoring locations and focused monitoring efforts associated with the implementation of the projects. Monitoring data would be shared between the project implementers to allow both adaptive management processes to proceed with the best available information.

6 Significant Unavoidable Adverse Impacts

6.1 Proposed Action

The cumulative impacts of the Project and restoration would generally improve all aspects of the freshwater fish habitat in the Sequalitchew Creek watershed. However, the cumulative impacts of the Project and restoration would permanently and unavoidably reduce the flow of the Sequalitchew Creek springs. This could reduce flows in the creek during drought years when surface water flow from Edmond Marsh is extremely low. Increased water temperature in the summer will create sub-lethal conditions that would reduce fish movement and growth until temperatures are reduced again in the fall. The overall effect of beaver management in storing winter water for summer release is not yet fully quantified, but the dry reach could still go dry and flows below the Sequalitchew Creek springs could be reduced during those periods.

6.2 No Action Alternative

Under the No Action Alternative, the dry reach would remain dry and Edmond Marsh would remain inaccessible to fish downstream. Lower Sequalitchew Creek would continue to have only a fraction of its historical flow and would remain unlikely to support spawning of chum and coho salmon. Rearing habitat for coho salmon and cutthroat trout would remain limited to just a few specific areas within the system.

1 Introduction

Glacier Northwest, Inc. dba CalPortland is seeking regulatory approvals for the Pioneer Aggregates South Parcel Project (South Parcel Project or Project), which proposes to extend sand and gravel mine operations to the southeast of existing activities at the Pioneer Aggregates Mine in DuPont, Washington. This Plants and Animals Technical Report (Report) has been prepared in support of the South Parcel Project. Figure 1 provides an overview map of the South Parcel Project.

This document evaluates the environmental conditions and potential impacts of the South Parcel Project, and potential alternative actions, on plant and animal resources. These analyses are being conducted as a component of the State Environmental Policy Act (SEPA) evaluation for the South Parcel Project.

The following Report describes existing conditions of plants and animals (affected environment), as well as analyzes potential impacts to plants and animals, including aquatic resources, from the proposed Project. In addition, proposed monitoring and mitigation measures for the proposed Project are presented. The proposed Project includes implementation of a Restoration Plan, a related project that will undergo separate environmental review, to mitigate and offset potential Project impacts and improve aquatic resource habitat within the South Parcel Project Area.

1.1 Description of the Proposed Action

The South Parcel Project includes horizontal expansion of mining into approximately 188 acres previously undisturbed by mining, and vertical expansion of approximately 125 acres where re-mining will deepen a portion of the existing mine. The South Parcel Project would extend mining at the current rate for approximately 14 additional years.

The proposed Project activities will be focused southeast of the existing Pioneer Aggregates Mine in the City of DuPont, southwestern Pierce County, Sections 22, 23, and 26, Township 19 North, Range 1 East of the Willamette Meridian (Figure 1). The Project is bordered to the north and west by the existing Pioneer Aggregates Mine; to the east by industrial/distribution facilities including Amazon, Dania, Pier 1 Imports, and FedEx; and to the south by Sequalitchew Creek and the Creekside Village residential development. The Project would occur on lands owned by Weyerhaeuser Company and leased to CalPortland.

The South Parcel Project includes mining within areas previously undisturbed by mining (termed the "Expansion Area") and mining deeper within a portion of existing mine, referred to as the "Re-Mine Area." The Expansion Area is approximately 188 acres and is comprised of three subareas (see Figure 2). The Kettle Area is a 10.8-acre previously undisturbed area. The 9.2-acre Buffer Strip is a strip of vegetation that was retained along the inside of the originally permitted mine bordering the South Parcel. The South Parcel Project is located southeast of the original mine and all portions of

the South Parcel Project are within the Mineral Resource Overlay in the City of DuPont's current adopted Comprehensive Plan.

The Re-Mine Area consists of 125 acres in the southeastern portion of the existing mine where groundwater limits the depth of current mining activities.

The South Parcel Project has been developed consistent with a 2012 Settlement Agreement between CalPortland, the City of DuPont, the Washington State Department of Ecology (Ecology) and a coalition of environmental groups collectively referred to as the Environmental Caucus. The Settlement Agreement describes a process for a Restoration Plan for the Sequalitchew Creek watershed to be permitted and implemented contemporaneously with mining of the South Parcel. The Restoration Plan is designed "to help restore and enhance the Sequalitchew Creek watershed, including flows along the entire length of the Creek." The Restoration Plan would provide substantial regional benefits and is not intended solely as mitigation for the South Parcel Project. The Restoration Plan is described in Section 4.4.3.

1.1.1 Existing Mine

CalPortland's original sand and gravel mine was permitted in 1997 (355 acres). As provided under the 2012 Settlement Agreement, CalPortland applied for permits in 2013 for the North Parcel Mine Expansion to allow mining of approximately 142 acres within the North Parcel. Following the publication of a Final EIS in June 2013, the North Parcel mining expansion was permitted in 2014.

Mining activities at the existing site include mining, processing, transport of sand and gravel, and manufacturing of concrete. The processing area is located adjacent to the mine site on a 52-acre parcel. Sand and gravel is removed from the mine by bull dozers and wheel loaders and transferred to the processing area by conveyor belts. At the processing facility, the material from the mine is crushed, washed, and separated into different size gradations. Aggregate products are stored in stockpiles in the processing area for distribution.

After completion of the production process, the majority of the finished aggregate products are transported from the plant area by conveyors and placed onto barges (approximately 80%) at Glacier's dock and barge-loading facility at Tatsolo Point. The remainder (approximately 20%) is sold as aggregate or used to make concrete on-site; in both cases it is transported by truck.

Water used to wash gravel during processing is recycled through a clarifying process to remove silt and clay. This fine material is then run through a belt press to remove excess water and transported by truck and placed in holding cells in the mine where it is allowed to dry for up to 3 years.

After drying, fines may be used to raise the floor of the mine by placing the material in cells separated by rock curtains to facilitate drainage. The material is placed in approximately 6-inch lifts and

compacted to a material dry density of 90% (ASTM International [ASTM]:D-1557) or greater. Once filled to the desired height with fines from the belt press in this manner, a gravel cap of not less than 10 feet is placed over the compacted fines to mitigate potential for settlement and facilitate drainage.

1.1.2 South Parcel Project

The proposed South Parcel Project includes expansion of the mine footprint by approximately 188 acres and extension of the existing rate of mining for an additional approximate 14-year period (depending on market conditions), increasing the available sand and gravel resources by 30 to 40 million tons. The entire South Parcel Project, including the Expansion Area, is located within a Mineral Resource Overlay applied by the City of DuPont's Comprehensive Plan. The purpose of the overlay is to conserve mineral resources of long-term commercial significance for future extraction, as required by the Growth Management Act. The South Parcel Project would involve six primary activities: logging, clearing and topsoil removal, groundwater management, mining, processing and transport, and reclamation. These activities would overlap, with multiple actions occurring at any one time.

1.1.2.1 Logging

Timber was logged from the South Parcel several years ago, but tree cutting would still be needed prior to clearing and mining in the Expansion Area. A substantial portion of the proposed mining would occur within previously reclaimed areas of the existing mine (i.e., the Re-Mine Area) or in previously unmined areas where the non-native invasive shrub species Scot's broom (*Cytisus scoparius*) dominates the landscape. The Expansion Area would be logged at a single time prior to initiating mining.

1.1.2.2 Clearing and Topsoil Removal

Clearing and topsoil removal would occur in the mine area, in segments as mining advances into the Expansion Area, over the life of the Project. Prior to mining, excavators would be used to remove stumps and vegetation. This material would then be processed through a portable tub grinder and used to amend topsoil for use in reclamation.

The Expansion Area is located downwind of the former Asarco copper smelter and refinery in Ruston, Washington. Airborne pollution emitted from the former smelter has resulted in a 1,000-square-mile, area-wide plume of arsenic- and lead-contaminated soil known as the Tacoma Smelter Plume. Surficial soils in the Expansion Area that have been undisturbed since the mid-1980s may contain arsenic and lead at concentrations above cleanup levels. These soils would be cleaned up under an approved plan developed in consultation with Ecology through the Voluntary Cleanup Program. The plan will incorporate the same process that is being successfully implemented on the North Parcel.

1.1.2.3 Groundwater Management

A portion of an existing aquifer is present in the sands and gravels to be mined under the South Parcel Project. Wells will be installed and pumped in advance of mining to intercept groundwater and dry out the gravels for mining. The mining plan is designed to minimize the amount of time that active dewatering by pumping wells is required.

Mining under the South Parcel Project will proceed slowly from the north to the south, extracting gravel to create a broad trough along the eastern property boundary, over a period of 5 to 8 years. Once mining of each section of the trough is completed, the adjacent wells can be turned off, allowing groundwater to passively seep from the stable mine slope and flow by gravity to an infiltration facility on the floor of the existing mine. After mining the trough along the perimeter, gravel will be extracted from the interior area.

A detailed dewatering plan has been developed and is described in detail in the Monitoring Plan. The dewatering plan involves four steps, occurring over different time scales. The four steps are:

- **The initial step** is a 60-day pumping test that is completely reversible (i.e., no gravel would be extracted during the test). The results of that test would be analyzed to confirm predictions from the groundwater drawdown model and used to adjust the dewatering plan (well spacing, well screening, etc.) as necessary prior to commencing the next phase.
- **The second step** involves installing and pumping additional dewatering wells to lower water levels in the first mine segment in preparation for mining. This step would last about 6 months and functions as a greatly expanded pumping test. As with the initial step, it is also completely reversible. Groundwater observations during pumping would be compared to model predictions in order to confirm that actual changes in groundwater are within the range predicted during Project planning, when potential impacts from the Project are evaluated. This step will confirm model predictions before any gravel is removed from the Expansion Area.
- **The third step**—active dewatering during mining—involves mining the trough described above. Additional dewatering wells will be installed and pumped as mining progresses. Mining would begin at the location farthest from the Edmond Marsh and Sequalitchew Creek and proceed slowly south. Completing the trough would require 5 to 8 years depending on market conditions and the success in meeting predicted groundwater levels. The potential impact on groundwater levels builds slowly over time as wells are added and mining progresses south. This allows ample opportunity to monitor, confirm model predictions, and adapt to the conditions observed before mining proceeds into each dewatered segment.
- **The final step**—passive dewatering—begins when mining of the trough described above is complete and the last dewatering well is turned off. Passive dewatering represents the groundwater condition that will continue in perpetuity. Groundwater, no longer intercepted

by wells, would form seeps at the toe of the eastern mine slope. It would flow by gravity through a conveyance ditch to newly created wetlands on the bottom of the existing mine and eventually to an infiltration pond. Once this step has begun, further mining activities in the interior of the South Parcel would not affect groundwater.

1.1.2.4 Mining

The method of mining for the South Parcel Project will be identical to that currently used in the permitted mine areas. A dozer would push excavated material from the top of the mine face to two front-end loaders working on the mine floor. The front-end loaders would scoop-up the sand and gravel and dump it into portable hoppers that feed conveyors leading to the processing area.

The mine face of each sequence area will be a maximum of 80 feet high and will decrease as mine activities progress. During reclamation, the graded side slopes and mine areas will be revegetated and stabilized in accordance with the mine reclamation plan.

A conveyor will start at the north end of the Expansion Area and will be extended south as mining progresses. The conveyor is comprised of a 48-inch-wide rubberized belt that is supported by a series of rollers, called idlers, mounted on steel framed segments that support the conveyor about 5 feet off the ground.

As mentioned above, clearing of the Expansion Area will occur in a sequence of segments, with one segment being cleared approximately each year, in coordination with mining and construction activities. Mass clearing of the site will not occur.

A 20-foot-high noise berm would be constructed along the southern boundary of the South Parcel. It would be located behind vegetation retained in a buffer. The berm will also be vegetated and would help reduce potential noise associated with mining for adjacent land uses. The berm will be constructed at the beginning of the Project prior to clearing in the adjacent portion of the South Parcel.

The Project will directly impact an approximately 1.78-acre Kettle Wetland located within the existing mine just west of the South Parcel. The Kettle Wetland will be impacted by dewatering in preparation for mining, then removed during the initial phases of mining of the South Parcel Project. Impacts to the Kettle Wetland will be mitigated by creation of a larger wetland within the existing mine. Detailed analysis of the wetland impacts and mitigation are described in the Wetland Mitigation Plan (Anchor QEA 2021a).

1.1.2.5 Processing and Transport

Material mined under the South Parcel Project would be conveyed from the mine to the existing processing facility and would be processed in the same general manner as at present. The material extracted under the South Parcel Project is anticipated to have a higher moisture content and fines

content than the aggregate currently being extracted. As a result, there may be minor adjustments to some of the equipment used in the processing area, but the overall process and most of the equipment would remain unchanged.

Water is used to wash the raw material conveyed from the mine to remove silt and clay. Sand and gravel smaller than 1.5 inches pass through a screening and classifying process that separates and conveys the material to a series of stockpiles sorted by size and stacked on the south side of the processing plant. Stones larger than 1.5 inches are crushed, sorted by size and conveyed to a series of crushed-rock stockpiles sorted by size north of the processing plant. Screening equipment, rock crushers and other processing equipment are located between the stockpiles of sorted rock products. Custom blended rock products are also made to customer specifications.

More than 95% of water used to process the mined material is recycled through a treatment system where silt and clay is removed so the water can be reused to process more raw material from the mine.

The mode and extent of transporting aggregate products from the site would not change relative to existing operations. Approximately 80% of the product would be loaded onto barges at the existing dock at Tatsolo Point and transported to the Puget Sound regional market by barges.

Approximately 20% of the product would be transported to the local market by truck. Some material would continue to be incorporated into concrete at the existing on-site concrete batch plant serving the local market.

1.1.2.6 Reclamation

As mining progresses, completed mine segments would be reclaimed. The reclamation plan will be reviewed by the Washington State Department of Natural Resources (DNR) for consistency with the Surface Mining Act (Revised Code of Washington 78.44). In general, reclamation will consist of regrading, replacement of topsoil, and revegetation, Glacier is in the process of preparing an application to revise the existing reclamation plan incorporated into the surface mine reclamation permit. The DNR cannot approve the revised reclamation permit until after the City's permits are issued. The proposed reclamation plan will be similar to the plan approved by the DNR for the existing mine.

A summary of the change in land uses that would occur as a result of the South Parcel Project after completion of mine reclamation is presented in Table 1. Table 1 also presents information about the portions of the existing mine where no changes are proposed as a result of the South Parcel Project, such as the North Parcel and Processing Area.

Table 1
Land Use Change as a Result of the South Parcel Project After Reclamation

Land Use	Area [1] in Acres									
	Existing Conditions					Proposed Action - Post-Reclamation				
	Expansion Area			Re-Mine Area	Total	Expansion Area			Re-Mine Area	Total
	South Parcel	Kettle Area	Buffer Strip			South Parcel	Kettle Area	Buffer Strip		
Built Areas										
Buildings	--	--	--	--	0.00	--	--	--	--	0.00
Roads, Access, and Parking	--	--	0.4	9.2	9.55	--	--	--	--	0.00
Processing Areas	--	--	0.2	17.9	18.08	--	--	--	--	0.00
Active Mining	--	--	--	--	0.00	--	--	--	--	0.00
Active Reclamation	--	--	0.2	20.5	20.62	--	--	--	--	0.00
Cleared for Mining	--	--	--	--	0.00	--	--	--	--	0.00
Water Management Ponds	--	--	--	--	0.00	--	--	--	--	0.00
Total Built Areas	0	0	0.8	47.5	48.26	0	0	0.00	0.00	0.00
Natural & Reclaimed Areas										
Areas Reclaimed as Forest	--	--	--	3.3	3.3	29.4	0.6	0.6	35.8	66.3
Areas Reclaimed as Grass	--	--	--	68.5	68.5	138.2	10.2	8.6	89.4	246.4
Wooded Areas	146.2	5.6	7.4	5.8	165.1	--	--	--		0.0
Grass Areas	21.3	--	1.0	0.21	22.5	--	--	--		0.0
Wetland	--	1.8	--		1.8	--	--	--		0.0
Wetland Buffer	--	3.4	--		3.4	--	--	--		0.0
Total Natural & Reclaimed Areas	167.5	10.8	8.4	77.7	264.5	167.5	10.8	9.2	125.2	312.7
Total	167.5	10.8	9.2	125.2	312.7	167.5	10.8	9.2	125.2	312.7

Notes:
-- Indicates no area of this type.
1) Totals may not exactly equal the sum of their components due to rounding.

As shown in Table 1, the primary change occurring as a result of the South Parcel Project is the conversion of existing wooded areas into areas reclaimed as forest and as grass. Generally, the steeper slope areas will be reclaimed as forest and flat and gently sloping areas will be reclaimed as grass lands to support future redevelopment. This is true for areas within the South Parcel as well as the Kettle and Buffer Area and the Re-Mine Area.

1.1.2.7 Estimated Volume and Extraction Rates

Based on past market demand, material would be extracted at an average rate of approximately 2.8 million cubic yards per year. An estimated 30 to 40 million cubic yards of material would be extracted as part of the Project, which would extend the life of the current operation by about 14 years. The actual extraction rate and life of the mine will depend on the market demand for materials. Estimated mining quantities are shown in Table 2.

Table 2
Estimated Annual Quantities and Timing of Aggregate Mining

Timing	Existing Mine[1]	South Parcel Project
Years 1 through 14	1.4 million cy	1.4 million cy
Years 14 through 19	0	2.8 million cy

Note:
Existing Mine includes North Parcel

1.2 Description of the Restoration Plan

The Restoration Plan, developed by CalPortland and the Environmental Caucus, seeks to restore and enhance streamflow and ecological functions from Sequalitchew Lake through Edmond Marsh into Sequalitchew Creek ravine. The Restoration Plan is a related action and is undergoing separate, contemporaneous SEPA review as part of the permitting for the actions specified in the plan. Restoration of Sequalitchew Creek is necessary because of almost two centuries of human manipulation. Today, portions of Sequalitchew Creek are dry, and the majority of what would be the natural flow in the creek is diverted out of the system. The Restoration Plan is intended to sequentially restore diverted flows back to the creek, improve the sustainability of flows through the system, and restore aquatic habitat by removing flow-related fish passage barriers and increasing the habitat available to aquatic species.

1.3 Description of the No Action Alternative

This document also evaluates the No Action Alternative. A No Action Alternative is required by SEPA. "No action" is interpreted to mean that the City would take no action on the mining proposal, but it does not necessarily mean that nothing would happen on the subject site.

Under the No Action Alternative, the South Parcel would not be mined and the property could be developed for manufacturing and research and residential uses under existing land use and zoning designations.

Portions of the South Parcel are zoned for Manufacturing and Research Park (MRP; 136.2 acres), Residential-4 (R-4; 16.1 acres), Residential Reserve (RR; 22.3 acres), and Open Space (3.8 acres) uses. The MRP zoned areas are subject to restrictive covenants related to Former DuPont Works Cleanup Site. These covenants restrict use of the property to industrial uses and, barring further remediation activities, would prevent re-zoning of the MRP areas.

The extent of development could vary considerably depending on zoning/density, and Project-specific and regulatory elements such as setbacks, open space, and critical areas. Areas zoned MRP would be available for development of up to 112 acres of light manufacturing and research. Buildings may be up to 65 to 70 feet tall and there are no maximum lot coverage

requirements other than necessary to meet required setback (25 feet on the front property line, 15 feet on the sides and rear) and landscaping (20% of lot area) requirements. Provision of 0.3 to 1 parking space per employee working at maximum shift is required.

Under the No Action Alternative, development would occur consistent with the City of DuPont Municipal Code (DMC) Critical Areas chapter (DMC 25.105), which could allow for development near the top of the Sequalitchew Creek ravine with a setback to be determined by a geotechnical engineer or engineering geologist. Development would also occur consistent with stream and wetland buffers and setbacks in DMC 25.105.

The areas of the South Parcel zoned R-4 can be developed at a density of up to 4.5 single-family residences per gross acre,[1] resulting in a total of approximately 76 residences. An additional four single-family residences could be developed in the smaller portion zoned for Residential Reserve density (one dwelling unit per 5 gross acres).

There would be no changes in the use of the areas of the South Parcel zoned for Open Space; these areas currently include the naturally vegetated slope of the Sequalitchew Creek ravine and the Sequalitchew Creek pedestrian trail. A summary of the parcels, zoning, and development potential of the South Parcel is presented in Table 3.

Table 3
Parcels, Zoning, and Development Potential of the South Parcel

Parcel No.	Zoning	Parcel Area in Acres	Potential Development
0119262015	MRP	21.0	16.8 acres MRP
	OS	3.8	None
	Total	24.7	16.8 acres MRP
0119262016	MRP	34.1	27.3 acres MRP
0119233016	MRP	20.0	16.0 acres MRP
0119233017	MRP	20.3	16.3 acres MRP
0119233014	MRP	20.3	16.3 acres MRP
0119233015	MRP	20.5	16.4 acres MRP
0119233011	R-4	16.1	72 residences
	R-R	22.3	4 residences
	Total	38.4	76 residences

Note:
Potential development for MRP areas includes buildings, parking lots, access roads, but not vegetated areas.

[1] "Gross acre" means land designated for residential purposes in the comprehensive plan, inclusive of related streets and neighborhood parks. DMC 25.10.040.

Under the No Action Alternative scenarios there would be no change in use of the areas within the existing mine. However, once the Re-Mine Area is reclaimed it would likely be redeveloped according to its underlying zoning, similar to the South Parcel.

The Kettle Wetland is within the existing mine and would remain intact, the buffers would remain vegetated, and mining operations would continue in other portions of the existing mine. The Kettle Wetland, its buffer, and other mine-related buffers would potentially be removed once the existing mine is reclaimed and redeveloped for future uses. Parcels, zoning, and potential development under the No Action Alternative are shown in Table 3.

2 Affected Environment

The affected environment for the plants and animals analysis includes the geographic areas that could be affected (directly and indirectly or cumulatively) by the proposed Project, including the South Parcel Project Area and the Restoration Plan Area. The South Parcel Project Area includes the approximately 125-acre Re-Mine Area and the approximately 188-acre Expansion Area (Figure 2). The Re-Mine Area is where re-mining will deepen a portion of the existing mine. This area contains a mixture of bare ground and patches of vegetation and no aquatic resources.

The Expansion Area is composed of three areas previously undisturbed by mining: the 168-acre South Parcel, the 10.8-acre Kettle Area, and the 9.2-acre Buffer Strip between the existing mine and the South Parcel. The Kettle Area includes the Kettle Wetland and forested wetland buffer. The Buffer Strip is a strip of vegetation that was retained along the inside of the originally permitted mine bordering the South Parcel. The South Parcel is a mixture of coniferous forest and shrubland habitat.

The Restoration Area includes the aquatic resources of Sequalitchew Creek and the following four wetland systems: East Edmond Marsh, West Edmond Marsh, Sequalitchew Creek Riparian Wetlands, and the Brackish Marsh (Figure 3). These aquatic resources are also within the area that could be affected by changes to groundwater levels (City of DuPont 2007; Herrera Environmental Consultants 2005a).

Three additional aquatic resources could be indirectly affected because they are within the area in which a change in groundwater levels is predicted. These areas include Sequalitchew Creek Ravine Seep Wetlands, Pond Lake, and Wetland 1D (Figure 3). Sequalitchew Creek Ravine Seep Wetlands, Pond Lake, and Wetland 1D are identified in this Report as Nearby Wetlands.

To identify and assess plants and animals, information was gathered from a variety of sources including existing literature, agency information, resource maps, and aerial photographs and site visits performed in 2017, 2019, and 2021 (Anchor QEA 2017, 2019, 2021a). A variety of extensive studies have been performed for this Project and previously proposed projects to mine the South Parcel. The analysis in this Report is based substantially on the information in the following existing documents and information from these documents are included by reference in this Report:

- *Glacier Northwest DuPont Mining Area Expansion and North Sequalitchew Creek Project Final Supplemental Environmental Impact Statement* (City of DuPont 2007)
- *Pioneer Aggregates Mining Facility and Reclamation Plan—Draft Environmental Impact Statement* (City of DuPont 1992)
- *CalPortland DuPont North Parcel Mining Project Final Supplemental Environmental Impact Statement* (City of DuPont 2013)

- *Addendum to the 2007 North Sequalitchew Creek Project Impact Area Wetland Delineation Report* (Anchor QEA 2018)
- Kettle Wetland Delineation Verification, October 22 and December 5, 2019 (Anchor QEA 2019)
- *Pioneer Aggregates Mine Expansion (South Parcel) Kettle Wetland Delineation Report* (Anchor QEA 2021c)
- *Supplemental Analysis of Sequalitchew Creek Area Wetlands Wetland Evaluations, Ratings, and Field Data* (Wetland Science Applications and Anchor Environmental 2005)

2.1 Plants and Habitat

Dominant plant communities and habitats within the South Parcel Project Area, the Restoration Area, and the areas subject to changes in groundwater levels include coniferous forests, shrublands, grassland, and aquatic resources (streams and wetlands). Rare plants and plant communities are also described.

2.1.1 Conifer Forests

Conifer forests cover most of the Expansion Area (Figure 4), including approximately 135 acres of the approximately 188 acres that would be cleared for mining (Figure 2). Second-growth conifer forests are interspersed with young regenerating stands as a result of previous timber harvest practices. Douglas-fir (*Pseudotsuga menziesii*) dominates the canopy and regeneration in most areas. Western red cedar (*Thuja plicata*) and Oregon white oak (*Quercus garryana*) also occur in smaller numbers within the conifer forest (Anchor QEA 2021a).

Common understory shrub species include beaked hazelnut (*Corylus cornuta*), snowberry (*Symphoricarpos albus*), trailing blackberry (*Rubus ursinus*), Scot's broom, and salal (*Gaultheria shallon*). Other species include twin flower (*Linnea borealis*), low Oregon grape (*Mahonia nervosa*), sword fern (*Polystichum munitum*), bald-hip rose (*Rosa gymnocarpa*), red huckleberry (*Vaccinium parvifolium*), ocean spray (*Holodiscus discolor*), black-cap raspberry (*Rubus leucodermis*), kinnikinnick (*Arctostaphylos uva-ursi*), bracken fern (*Pteridium aquilinum*), St. John's wort (*Hypericum perforatum*), western and hairy honeysuckles (*Lonicera ciliosa* and *L. hispidula*, respectively), wild strawberry (*Fragaria vesca*), yarrow (*Achillea millefolium*), yerba buena (*Satureja douglasii*), wood rush (*Luzula parviflora*), velvet grass (*Holcus lanatus*), and colonial bentgrass (*Agrostis capillaris*) (City of DuPont 2007, 2013; Herrera Environmental Consultants 2005b).

The Re-Mine Area is an active mining area dominated with grassland, with patches of shrubland and young stands of red alder (*Alnus rubra*). An approximately 5-acre patch of conifer forest located at the south end of the Re-Mine Area with similar species composition as the Expansion Area (Figure 2).

Forest vegetation within the Restoration Area includes riparian habitat associated with Sequalitchew Creek and wetland buffer habitat of wetlands within the Restoration Area. These forested areas are a mixture of coniferous and deciduous trees with a diverse shrub and herbaceous understory. Sequalitchew Creek, wetlands within the Restoration Area, and nearby wetlands are described in Section 2.1.3, Aquatic Resources.

2.1.1.1 Landmark Trees

A landmark tree survey was performed within the Expansion Area and Re-Mine Area per DMC Critical Area Chapter 25.10.120.005 criteria (Anchor QEA 2021a). Five species and a total of 116 landmark trees were identified during the survey. Landmark tree species include Douglas-fir, Oregon white oak, Pacific madrone, (*Arbutus menziesii*) Pacific yew (*Taxus brevifolia*), and western red cedar. The species and number of landmark trees within the Expansion Area and Re-Mine Area are shown in Table 4.

Table 4
Summary of Landmark Trees Within the Expansion Area and Re-Mine Area

Common Name	Scientific Name	Expansion Area Total Trees[1]	Re-Mine Area Total Trees
Douglas-fir	*Pseudotsuga menziesii*	81	1
Oregon white oak	*Quercus garryana*	17	2
Pacific madrone	*Arbutus menziesii*	2	0
Pacific yew	*Taxus brevifolia*	2	0
Western red cedar	*Thuja plicata*	10	1
Total		**112**	**4**

Note:
1. Includes adjacent buffer.

2.1.2 Shrublands

Shrublands within the Expansion Area are dominated by the non-native invasive species Scot's broom (Figure 2). This non-native invasive plant community covers approximately 42 acres of the approximately 188 acres proposed for clearing under the Project. Plant coverage beneath this layer is restricted to mosses and small patches of colonial bentgrass. Native shrub species are mostly absent and are present in only a few areas adjacent to patches of native tree species. The native herbaceous species include Idaho fescue (*Festuca idahoensis*), chocolate lily (*Fritillaria lanceolata*), early blue

violet (*Viola adunca*), and Pacific sanicle (*Sanicula crassicaulis*) (City of DuPont 2007, 2013; Herrera Environmental Consultants 2005b).

The Re-Mine Area is an active mining area dominated with grassland areas that were hydroseeded during reclamation. The presence of the non-native invasive species Scot's broom and the native species red alder are controlled as part of the reclamation process (Figure 2).

Shrublands within the Restoration Area and associated with the nearby wetlands include wetland buffer habitat that is a mixture of native and non-native shrub species. Sequalitchew Creek, wetlands within the Restoration Area, and nearby wetlands are described in Section 2.1.3, Aquatic Resources.

2.1.3 Aquatic Resources

Aquatic resources include Sequalitchew Creek, Puget Sound shoreline nearshore springs, and eight wetland communities. No aquatic resources are located within the Re-Mine Area. One aquatic resource, the Kettle Wetland, is located within the Expansion Area (Figure 2). Sequalitchew Creek and the East Edmond Marsh, West Edmond Marsh, Sequalitchew Creek Riparian Wetlands, and the Brackish Marsh wetland systems are located outside of the mine footprint but within the Restoration Area and within the area where changes in groundwater levels are predicted. Three nearby wetlands located within the area that could potentially be affected by changes in groundwater levels are Sequalitchew Creek Ravine Seep Wetlands, Pond Lake, and Wetland 1D (Figure 3).

No change is predicted to groundwater quantity or quality that feeds the nearshore springs located along the Puget Sound shoreline, and no changes to the nearshore springs are identified (Aspect 2022).

2.1.3.1 Expansion Area Wetlands

2.1.3.1.1 Kettle Wetland

The 1.78-acre Kettle Wetland is located within the Expansion Area (Figure 2). This wetland would be removed by proposed mining on the South Parcel. It contains persistent emergent, non-persistent emergent, aquatic bed, and scrub-shrub wetland communities (City of DuPont 2007, 2013; Anchor QEA 2021c). The dominant hydrologic source for the wetland is the aquifer system. Water levels within the wetland are determined by the seasonal fluctuation in the elevation of the Vashon Aquifer.

The emergent communities consist of common mare's tail (*Hippuris vulgaris*), creeping spike rush (*Eleocharis palustris*), giant bur-reed (*Sparganium eurycarpum*), water parsnip (*Sium suave*), reed canarygrass (*Phalaris arundinacea*), water ladysthumb (*Polygonum amphibium*), mild waterpepper (*Polygonum hydropiperoides*), skunk cabbage (*Lysichiton americanus*), inflated sedge (*Carex vesicaria*), and northern bugleweed (*Lycopus uniflorus*). Aquatic species observed include pondweed

(*Potamogeton* sp.), lesser duckweed (*Lemna minor*), arrowleaf bur-reed (*Sparganium angustifolium*), and floating-leaved pondweed (*Potamogeton natans*).

Along the wetland boundary, the scrub-shrub community consists of Pacific willow (*Salix lasiandra*), Scouler's willow (*Salix scouleriana*), sitka willow (*Salix sitchensis*), red-osier dogwood (*Cornus sericea*), and hardhack (*Spiraea douglasii*). Other vegetation along the wetland boundary consists of stinging nettle (*Urtica dioica*), blue elderberry (*Sambucus caerulea*), beaked hazelnut, and Henderson sedge (*Carex hendersonii*).

Buffer vegetation bordering the Kettle Wetland includes tree, shrub, grass, and herbaceous species. Dominant tree species include big-leaf maple (*Acer macrophyla*), red alder, black cottonwood (*Populus trichocarpa*), western red cedar, bitter cherry (*Prunus emarginata*), Douglas hawthorne (*Crataegus Douglasii*), blue elderberry, and Pacific madrone. Dominant shrub species include trailing blackberry, salal, snowberry, Scot's broom, Oregon grape, bald-hip rose, ocean spray, sword fern, Saskatoon serviceberry (*Amelanchier alnifolia*), red huckleberry, and bracken fern. Herbaceous species include velvet grass, western wild-rye (*Elymus glaucus*), and colonial bentgrass (*Agrostis capillaris*). Vine species include manroot (*Marah oreganus*).

The Kettle Wetland is classified as a Category III wetland using the City's rating system (DMC 25.105.050) and the Ecology rating system (Anchor QEA 2021c; Hruby 2014). This wetland is not regulated by the U.S. Army Corps of Engineers because it lacks a surface water connection to waters of the U.S. (Corps 2019).

2.1.3.2 Restoration Area Wetlands

These resources are discussed generally here and will be evaluated fully in a separated environmental review. The following is intended to provide context of the effects of the related action (restoration) in comparison to the Proposed Action (mining).

2.1.3.2.1 West Edmond Marsh

West Edmond Marsh is the portion of Edmond Marsh located west of Robinson Trail, a former railroad grade that bisects Edmond Marsh and east of Center Drive (Figure 3). West Edmond Marsh occupies approximately 80 acres. It has a hydrologic regime dominated by surface water inputs entering East Edmond Marsh to the east and smaller inputs from stormwater infiltration ponds along the north and south. Sequalitchew Creek follows a relatively straight path near the northern boundary of the marsh that results from historical efforts to drain and channelize the marsh.

Water levels in West Edmond Marsh are controlled by multiple beaver dams, the most significant of which is a large beaver dam at the western boundary just upstream of the normally dry reach of Sequalitchew Creek under Center Drive.

Seasonal high water levels in West Edmond Marsh range from about 210 feet elevation in the westernmost portion to 211.8 feet elevation just downstream of Robinson Trail. The westernmost portion has seasonal variation in water levels of 4 to 5 feet and typically dries up in summer. The portion near Robinson Trail retains water year-round and typically experiences a seasonal range in water levels of 1 to 1.5 feet. Water levels in West Edmond Marsh exhibited an increasing trend from 2004 to 2014 and have since appeared to stabilize at the higher level.

Vegetative communities include scrub-shrub, emergent, and aquatic bed wetland types (City of DuPont 2007, 2013; Herrera Environmental Consultants 2005b; Wetland Science Applications and Anchor Environmental 2005). The eastern portion of the marsh is shallow to deeply inundated, due to impoundment by beaver dams. Dominant vegetation includes black cottonwood, willows (*Salix* sp.), spiraea (*Spirea douglasii*), water parsley (*Oenanthe sarmentosa*), yellow pond lily (*Nuphar luteum* var. *polysepala*), pond weed (*Lemna minor*), cattails (*Typha latifolia*), and reed canarygrass (*Phalaris arundinacea*). The area includes upland islands that are forested with mature Douglas-fir, black cottonwood, and other native species. The dense, layered vegetation within the marsh, upland islands, and patches of open water provide high-quality wildlife habitat and offer a substantial habitat base for native wetland plant and animal species.

West Edmond Marsh is classified as a Category II wetland using the City's rating system (DMC 25.105.050) and the Ecology rating system (Hruby 2014). Over time, the hydrology of West Edmond Marsh has been affected by various efforts to maintain an open water channel through dense scrub-shrub wetland. The construction and periodic maintenance of this channel through the marsh maintained water levels that were lower than currently exist. Subsequent impoundment of water by beaver dams across this channel and elsewhere in the marsh has resulted in water levels of the marsh steadily increasing in recent decades, as is evidenced by the drowning of some mature upland trees (Anchor QEA 2022 and aerial imagery).

2.1.3.2.2 East Edmond Marsh

East Edmond Marsh occupies approximately 55 acres (Figure 3) between the Robinson Trail on the west and DuPont-Steilacoom Road on the east. East Edmond Marsh continues to the east of DuPont-Steilacoom on Joint Base Lewis-McChord. This segment of the Marsh is not evaluated in this Report but will be evaluated as part of separate environmental review required for the Restoration Plan.

Historically, the primary source of water to East Edmond Marsh was the surface water of Sequalitchew Creek flowing out of Sequalitchew Lake. The creek followed a meandering channel through the marsh that was been excavated and cleared by human activity. However, beaver activity has resulted in water levels in East Edmond Marsh that are higher than in Sequalitchew Lake, and now the hydrology of East Edmond Marsh is dominated by groundwater inflows from multiple

sources including regional groundwater, shallow subsurface flow from nearby Bell, Hamer, and McKay marshes, and stormwater from nearby infiltration ponds.

The water level in East Edmond Marsh is controlled by a large beaver dam located just upstream of the primary culvert under Robinson Trail and is relatively uniform throughout the marsh segment. Seasonal high water levels are typically about 212.5 to 213 ft NGVD 29. East Edmond Marsh retains water year-round, with a typical water level fluctuation of 1 to 1.5 feet seasonally

Vegetative communities include forested, scrub-shrub, emergent, and aquatic bed wetland types. Dominant vegetation includes black cottonwood, red alder, Oregon ash (*Fraxinus latifolia*), willows, red-osier dogwood, spiraea, sedges (*Carex* spp.), bulrushes (*Scirpus* spp.), water smartweed (*Polygonum amphibium*), water parsley, cattails, and reed canarygrass. Floodwater storage, sediment sequestering, nutrient filtration, and biological support are strong functions of East Edmond Marsh. The area includes upland islands that are forested with mature Douglas-fir, black cottonwood, and other native species. The dense, layered vegetation within the marsh, upland islands, and patches of open water provide high-quality wildlife habitat and offer a habitat base for native wetland plant and animal species (City of DuPont 2007, 2013; Herrera Environmental Consultants 2005b; Wetland Science Applications and Anchor Environmental 2005).

East Edmond Marsh is classified as a Category II wetland using the City's rating system (DMC 25.105.050) and the Ecology rating system (Hruby 2014).

2.1.3.2.3 Sequalitchew Creek Ravine Riparian Wetlands

The riparian forest wetland that borders Sequalitchew Creek west of Center Drive (Figure 3) includes many areas of braided flow and side-channels, flood terraces, and well-established forested riparian wetland vegetation communities. The canopy species include red alder, big-leaf maple, and western red cedar. Common shrub species include vine maple (*Acer circinatum*), salmonberry (*Rubus spectabilis*), red elderberry (*Sambucus acemose*), black gooseberry (*Ribes lacustre*), and cascara (*Rhamnus purshiana*). Common herbaceous species include mannagrass (*Glyceria elata*), giant horsetail (*Equisetum telmatiea*), American brooklime (*Veronica americana*), slough sedge (*Carex obnupta*), stinging nettle, Cooley's hedge-nettle (*Stachys coolyeii*), and water parsley (City of DuPont 2007, 2013; Herrera Environmental Consultants 2005b; Wetland Science Applications and Anchor Environmental 2005).

The Sequalitchew Creek riparian forest wetlands are considered Category II wetlands using the City's rating system (DMC 25.105.050) and the Ecology rating system (Hruby 2014).

2.1.3.2.4 Brackish Marsh

Near its mouth, Sequalitchew Creek passes through a concrete box culvert (5 feet wide by 5 feet high and 240 feet long) under the BNSF Railway Company rail line before discharging into Puget Sound.

Upstream of this culvert is a brackish marsh (Figure 3). The brackish marsh occupies a series of terraces dissected by dendritic channels. Common species include Lyngby's sedge (*Carex lyngbeyi*), seacoast bulrush (*Scirpus maritimus*), seashore saltgrass (*Distichlis spicata*), marsh cinquefoil (*Potentilla anserina*), and gumweed (*Grindelia integrifolia*). Significant patches of colonial bentgrass occur along the margins of the brackish marsh (City of DuPont 2007, 2013; Herrera Environmental Consultants 2005b; Wetland Science Applications and Anchor Environmental 2005).

The Sequalitchew Creek brackish marsh is classified as a Category II wetland using the City's rating system (DMC 25.105.050) and the Ecology rating system (Hruby 2014).

2.1.3.3 Nearby Wetlands

2.1.3.3.1 Sequalitchew Creek Ravine Seep Wetlands

The ravine containing Sequalitchew Creek contains seeps and springs that surface from mid-slope to the toe of slope. These seeps and springs provide base flow to Sequalitchew Creek and contribute to species diversity within the area by supporting plant species that require more moisture than is available in surrounding upland areas. A 0.13-acre seep wetland complex consisting of two long, very narrow, and non-contiguous wetlands is located just above the trail along Sequalitchew Creek at about river mile 0.75 to 0.85. The wetland hydrology emanates from seep heads just above the trail and is dominated by groundwater. Dominant vegetation species include willow herb (*Epilobium ciliatum*) and lady fern (*Athyrium filix-femina*) (City of DuPont 2007), and the ravine includes plant species identified in Section 2.1.3.2.3.

These forested Seep Wetlands are classified as Category IV wetlands using the City's rating system (DMC 25.105.050) and the Ecology rating system (Hruby 2014).

2.1.3.3.2 Wetland 1D

Wetland 1D is located immediately north of West Edmond Marsh and south of Center Drive (Figure 3). The wetland covers approximately 2.1 acres and is dominated by scrub-shrub vegetation including Pacific willow, spiraea, western crabapple *(Malus fusca*), and red-osier dogwood. Wetland 1D is shallow and permanently inundated (City of DuPont 2007, 2013; Herrera Environmental Consultants 2005b; Wetland Science Applications and Anchor Environmental 2005).

Water levels in Wetland 1D range seasonally from 208.6 to 211 feet NGVD 29 and track closely with nearby groundwater levels.

Wetland 1D is considered a Category II wetland using the City's rating system (DMC 25.105.050) and the Ecology rating system (Hruby 2014).

2.1.3.3.3 Pond Lake

Pond Lake is located approximately 0.5 mile south of the proposed Expansion Area (Figure 3). The water level in Pond Lake typically exhibits a seasonal range of about 4 feet and tracks closely with nearby groundwater levels. It is a shallow pond dominated by herbaceous species, with a forested upland edge dominated by red alder and big-leaf maple. The dominant species in the wetland is reed canarygrass. Small pockets of native species including sedges and water-plantain (*Alisma plantago-aquatica*) occur in the wetland (City of DuPont 2007, 2013; Herrera Environmental Consultants 2005b; Wetland Science Applications and Anchor Environmental 2005).

Pond Lake is considered a Category III wetland using the City's rating system (DMC 25.105.050) and the Ecology rating system (Hruby 2014). Due to a lack of a surface water connection with other waters of the U.S., this wetland is not regulated by the Corps.

2.1.3.4 Nearshore Springs

Nearshore springs located on the forested hillside of Puget Sound flow directly into Puget Sound (Figure 3). These springs express from the hillside and there is no surface flow associated with these features within the South Parcel Project Area.

2.1.4 Rare Plants and Plant Communities

2.1.4.1 Washington Department of Fish and Wildlife Plants and Priority Habitats

No rare plants are identified by Washington Department of Fish and Wildlife (WDFW) in locations where mining could occur in the South Parcel Project Area or within the areas subject to changes in groundwater levels (WDFW 2022a). No populations of white-topped aster (*Sericocarpus rigidus*), a state sensitive species, have been documented within the limits of the South Parcel Project Area, although populations do occur in Pierce County (WDNR 2022) and in oak forests adjacent to the South Parcel Project Area (City of DuPont 2007; Herrera Environmental Consultants 2005b).

A patch of forested habitat at the south end of the Re-Mine Area where mining is proposed is mapped by WDFW as priority habitat biodiversity areas and corridor, but the physical characteristics within the small portion where mining is planned do not meet WDFW's stated criteria. Specifically, this area is flat, developable land and is not part of the steep, undevelopable ravine side slope. The forested riparian habitat of Sequalitchew Creek and the forested hillside of Puget Sound near where mining is proposed are also mapped as priority habitat biodiversity areas and corridor. The habitat of East and West Edmond Marsh are mapped by WDFW as waterfowl concentration areas (WDFW 2022a). The Priority Habitats and Species (PHS) database does not include any white oak woodlands in or around the Project area, or within the City of DuPont. Where white oak exist within the Project area, they are interspersed in a primarily coniferous forest within the Expansion Area and account for less than 5% of the canopy. WDFW defines priority Oregon white oak woodlands as

stands of pure oak or oak/conifer associations where canopy coverage of the oak component of the stand is 25%; or where total canopy coverage of the stand is less than 25%, but oak accounts for at least 50% of the canopy coverage present. The latter is often referred to as an oak savanna. In non-urbanized areas west of the Cascades, priority oak habitat consists of stands 0.4 hectare (1 acre) in size (Larsen and Morgan 1998). Therefore, the oak stand on the Project site does not meet WDFW criteria for priority habitat.

Important habitats in the larger vicinity of the South Parcel include the Nisqually Delta, a large, high-quality wetland complex with regionally rare intact estuarine functions and native plant populations, abundant wildlife habitat, and high utilization by wildlife.

2.1.4.2 Threatened and Endangered Plants

The U.S. Fish and Wildlife Service (USFWS) identifies Endangered Species Act (ESA)-listed plant species and critical habitats under USFWS jurisdiction that occur or may occur within a specific location where a project is proposed on the agency's website (USFWS 2021a). The status of federally listed plant species and critical habitats protected under the ESA that occur or may occur where mining could occur in the South Parcel or within the area subject to changes in groundwater levels is presented in Table 5.

Table 5
Federally Listed Plant Species that May Occur in the South Parcel or Areas Subject to Changes in Groundwater Levels, with Their Endangered Species Act and Critical Habitat Status

Species	Status	Critical Habitat
Golden paintbrush (*Castilleja levisecta*)	Threatened	None designated
Marsh sandwort (*Arenaria paludicola*)	Endangered	None designated

Potential habitat for the plant species golden paintbrush (*Castilleja levisecta*; USFWS 2021b) and marsh sandwort (*Arenaria paludicola*; USFWS 2021c) is not located in or within the vicinity of the South Parcel Project Area or within the area subject to changes in groundwater level.

2.2 Fungi

Species of mushroom in the project area are likely consistent with the variety of mushroom species that thrive in the Pacific Northwest's temperate conditions. These include species that associate with coniferous trees (ectomycorrhizal fungi), those that decompose organic material (saprotrophic fungi), and generalists found in multiple ecosystems. There are no records of the presence of rare or endangered species of moss, lichen, nor fungi in DuPont, no surveys specific to the project area have been conducted. Species likely to occur in the project area include: the Ectomycorrhizal species

2.3 king bolete (*Boletus edulis*), fy agaric (*Amanita muscaria var. flavivolvata*), Pacific golden chanterelle (*Cantharellus formosus*), saffron milk cap (*Lactarius deliciosus*); and the saprotrophic species, turkey tail (*Trametes versicolor*), oyster mushroom (*Pleurotus ostreatus*), shaggy mane (*Coprinus comatus*), and honey mushroom (*Armillaria solidipes*).Animals

Animal species are described based on the animal types: birds, mammals, and amphibians. Additional information on the wide variety of common species that use habitats within the Project vicinity is also described in the Pioneer Aggregates Draft EIS (City of DuPont 1992). Several federally and state-listed species occur within the Project vicinity. Their status and use of the Project vicinity are described in subsequent sections of this Report.

2.3.1 Birds

The South Parcel Project Area and Restoration Area provides a range of habitat features that can provide breeding, foraging, resting, and overwintering habitat to support a wide range of bird species (Johnson and O'Neil 2001; Hamer et al. 2018). Forested habitats provide foraging and nesting habitat for a wide variety of songbird species such as song sparrow (*Melospiza melodia*), bushtit (*Psaltriparus minimus*), Bewick's wren (*Thryomanes bewickii*), Steller's jay (*Cyanocitta stelleri*), spotted towhee (*Pipilo erythrophthalmus*), Swainson's thrush (*Catharus ustulatus*), winter wren (*Troglodytes hiemalis*), varied thrush (*Ixoreus naevius*), black-capped chickadee (*Parus atricapillus*), dark-eyed junco (*Junco hyemalis*), chestnut-backed chickadee (*Parus rufescens*), golden-crowned kinglet (*Regulus satrapa*), and red-breasted nuthatch (*Sitta canadensis*).

Upland shrublands and herbaceous habitats are used by species like barn swallow (*Hirundo rustica*), tree swallow (*Tachycineta bicolor*) and white-crowned sparrow (*Zonotrichia leucophrys*). Predatory birds like red-tailed hawk (*Buteo jamaicensis*) commonly hunt in these habitat types. Other raptors such as northern harrier (*Circus cyaneus*) and bald eagle (*Haliaeetus leucocephalus*) occur in forested areas near waterbodies. Snags and downed trees in forested habitat and along the forest edges also provide perch sites for these species. Snags in forested habitats also provide potential nest sites for cavity-nesting birds such as great horned owl (*Bubo virginianus*), and species of woodpeckers including downy woodpecker (*Picoides pubescens*), northern flicker (*Colaptes auratus*), and pileated woodpecker (*Dryocopus pileatus*).

Aquatic habitats and wetland habitats provide a variety of habitat for terrestrial birds, waterbirds, and waterfowl. Open water sections of wetlands can be expected to provide habitat for belted kingfisher (*Megaceryle alcyon*) and wintering and migratory waterfowl, including gadwall (*Anas strepera*), American widgeon (*Mareca americana*), mallard (*Anas platyrhynchos*), ring-necked duck (*Aythya collaris*), and American coot (*Fulica americana*). Wetland areas with grass and herbaceous vegetation

provide habitat for red-winged blackbird (*Agelaius phoeniceus*), song sparrow, and marsh wren (*Cistothorus palustris*), among other species including waterfowl. Forested and scrub-shrub wetlands are commonly used by similar species as well as wood duck (*Aix sponsa*). Waterbird species such as great blue heron (*Ardea herodias*) also use many of these habitats.

2.3.2 Mammals

Small mammal species associated with forested habitats include shrew mole (*Neurotrichus gibbsii*), Townsend's vole (*Microtus townsendii*), masked shrew (*Sorex cinereus*), and striped skunk (*Mephitis mephitis*). Larger mammals such as black-tailed deer (*Odocoileus hemionus columbianus*) and coyote (*Canis latrans*) also occur throughout the site.

Wetlands and riparian areas provide habitat for North American beaver (*Castor canadensis*), water shrew (*Sorex palustris*), and raccoon (*Procyon lotor*). Beavers are well documented in the wetland habitats of East and West Edmond Marsh. The non-native species Virginia opossum (*Didelphis virginiana*) also occurs in these habitat types. These and similar species depend on water for foraging, breeding, and sometimes, overwintering habitats.

2.3.3 Amphibians

Wetlands and streams provide habitat for amphibian species such as northern red-legged frog (*Rana aurora*), northwestern salamander (*Ambystoma gracile*), Pacific treefrog (*Pseudacris regilla*), roughskin newt (*Taricha granulosa*), and western red-backed salamander (*Plethodon vehiculum*).

2.3.4 Washington Department of Fish and Wildlife Priority Species

Three species are mapped by WDFW as occurring or habitat presence within the South Parcel Project Area and the area subject to changes in groundwater level: big brown bat (*Eptesicus fuscus*), little brown bat (*Myotis lucifugus*), and Yuma myotis bat (*Myotis yumanensis*). These bat species occur in forested habitats, typically occupying mature trees (WDFW 2022a). These bat species are not state or federally listed.

Western gray squirrel (*Sciurus griseus*), a state threatened species, is documented within the Project vicinity (Herrera Environmental Consultants 2005b) but is not currently identified by WDFW as occurring within the South Parcel Project Area and the area subject to changes in groundwater level. This species favors Garry oak (*Quercus garryana*) woodlands as prime habitat. This habitat occurs within areas adjacent to the South Parcel Project Area, in patches throughout the City of DuPont, and also within the Fort Lewis Military Reservation. This species also forages within coniferous forests that occur near Garry oak woodlands.

The western gray squirrel was listed as threatened in Washington State in 1993 (WAC 323.12.011), and as endangered in 2023 (WAC 220-601-010). There are three known populations in Washington:

the southern Puget Trough, north-central Washington, and south-central Washington (Vander Haegen and Orth 2011). Typical western gray squirrel habitat in the Puget Trough includes a Douglas-fir-Oregon white oak woodland with an understory dominated by snowberry (*Symphoricarpos albus*), California hazelnut (*Corylus cornuta* var. *californica*), Indian plum (*Oemleria cerasiformis*), and sword fern (*Polystichum munitum*) (Ryan and Carey 1995). Ryan and Carey continue to describe the typical characteristics of oak woodlands that are important to western gray squirrels as consisting of a mix of Douglas-fir (53% on average) with oaks comprising 34% on average. These characteristics were not observed within the South Parcel Project Area.

One of the primary limiting factors in western gray squirrel success in the Puget Trough is the lack of genetic diversity through habitat fragmentation (Linders and Stinson 2007). The South Parcel is separated from the primary western gray squirrel population at Joint Base Lewis-McChord (JBLM) by Interstate 5, as well as several other heavily used roadways. While a small amount of canopy connectivity to JBLM property exists across the Puget Sound Bluff and up Sequalitchew Creek ravine, the lack of connectivity to confirmed squirrel-populated sites contributes to the overall lack of habitat potential on the South Parcel for gray squirrels.[2]

Based on the above discussion, the South Parcel does not provide primary (nesting, breeding) habitat for western gray squirrel. While the site does possess marginal characteristics of secondary squirrel habitat (conifer-dominated, moderate canopy and shrub coverage), several identified factors make the possibility of use of the South Parcel by western gray squirrel remote.

2.3.5 Threatened and Endangered Species

USFWS identifies ESA-listed species and critical habitats under USFWS jurisdiction that occur or may occur within a specific location where a project is proposed on the agency's website (USFWS 2021a). The status of federally listed species and critical habitats protected under the ESA that USFWS identify as occurring or may occur in the South Parcel or within the area subject to changes in groundwater level is presented in Table 6. None of the species listed in Table 6 have been identified to be present within the Project area during field studies or database review conducted by Anchor QEA.

Table 6
Federally Listed Species that May Occur in the South Parcel or Areas Subject to Changes in Groundwater Level, with Their Endangered Species Act and Critical Habitat Status

Species	Status	Critical Habitat
Birds		

[2] WDFW's PHS on the web (https://geodataservices.wdfw.wa.gov/hp/phs/) shows only one observation of a western gray squirrel between the Nisqually Delta and University place. It was made over 3 miles from the project area in 1977. All more recent observation have been on the other side of Interstate 5.

Species	Status	Critical Habitat
Northern spotted owl (*Strix occidentalis caurina*)	Threatened	Designated (not present)[1]
Marbled murrelet (*Brachyramphus marmoratus*)	Threatened	Designated (not present)[1]
Streaked horned lark (*Eremophila alpestris strigata)*	Threatened	Designated (not present)[1]
Yellow-billed Cuckoo (*Coccyzus americanus)*	Threatened	Designated (not present)[1]
Mammals		
Roy Prairie Pocket Gopher (*Thomomys mazama glacialis*)	Threatened	Designated (not present)[1]
Amphibians		
Oregon spotted frog (*Rana pretiosa*)	Threatened	Designated (not present)[1]

Note:

1. No records of the observed presence of this species utilizing the Project area have been found, and no observations have been made during field studies of the Project area.

Potential habitat for northern spotted owl (*Strix occidentalis caurina*) and marbled murrelet (*Brachyramphus marmoratus*), mature and old growth forest communities, is not located in or within the vicinity of the South Parcel or within the areas subject to changes in groundwater level. The WDFW PHS database records no species occurrence for northern spotted owl or marbled murrelets in or near the Project area (WDFW 2022a).

The species streaked horned lark (*Eremophila alpestris strigata*) and yellow-billed cuckoo (*Coccyzus americanus*) are generally considered to have a low tolerance to human activity. Potential habitat for streaked horned lark, yellow-billed cuckoo, and Roy prairie pocket gopher (*Thomomys mazama glacialis*) is not located within or near the South Parcel or the areas subject to changes in groundwater level. The WDFW PHS database records no species occurrence for these species in or near the Project area (WDFW 2022a).

Oregon spotted frog (*Rana pretiosa*) is highly aquatic and rarely found away from water. Within a watershed, most breeding populations are small, and many are isolated from other breeding populations. They require breeding sites in shallow water with short vegetation and full sun exposure. Only six watersheds are currently known to be occupied in Washington: Sumas River, South Fork Nooksack River, Samish River, upper Black River, lower Trout Lake Creek, and at Conboy Lake and Camas Prairie in the Outlet Creek drainage. The WDFW PHS database records no species occurrence for this species in or near the Project area (WDFW 2022a).

There are no state or federally listed fish species documented to occur in Sequalitchew Creek (WDFW 2022b; Anchor QEA 2022). The estuary and marine nearshore are potentially used by federally listed Chinook salmon and bull trout.

3 Impacts of the Proposed Action and No Action Alternative

This section describes the potential direct, indirect, and cumulative impacts to plants and habitat and animals from the Proposed Action (in Sections 3.1, 3.2, and 3.3, respectively). The direct and indirect impacts of the No Action Alternative are discussed in Sections 3.4 and 3.5, respectively). Section 3.6 identifies monitoring and mitigation measures that could avoid, minimize, or reduce potential impacts. Significant unavoidable adverse impacts are identified in Section 3.7.

Potential impacts to plants and habitat and animals from the proposed South Parcel Project include the following:

- Direct impacts related to logging, land clearing, mining activities, and reclamation in the proposed Re-Mine Area and the Expansion Area. Direct impacts include proposed activities within the South Parcel Project Area.
- Indirect impacts related to project-related changes in groundwater levels and restoration activities that could occur outside the South Parcel Project Area.
- Cumulative impacts include those resulting from South Parcel mining and additional actions implemented within the watershed pursuant to the Restoration Plan, including beaver management in Edmond Marsh and flow restoration in Sequalitchew Creek. Cumulative impacts are described in Section 4.

3.1 Direct Impacts of the Proposed Action on Plants and Habitat

3.1.1 Conifer Forests

All existing coniferous forests within the South Parcel Project Area would be logged prior to initiating mining. The total area of coniferous forest within the Re-Mine Area is approximately 15 acres, and the Expansion Area is approximately 135 acres. Revegetation would occur throughout the South Parcel Project Area according to the details of the reclamation plan developed for both the existing and proposed mining areas. Reclamation would include the establishment of mixed species and conifer dominant forests along the slopes of the mine.

3.1.2 Landmark Trees

Ninety landmark trees have been identified as being located within the areas that would be cleared under the proposed Project including Douglas-fir (74), Garry oak (13), Pacific madrone (1), Pacific yew (1), and western red cedar (1) (Anchor QEA 2021a).

3.1.3 Shrublands and Grasslands

All shrublands and grasslands within the South Parcel Project Area would be cleared in conjunction with logging activities. The total area of shrublands and grasslands within the Re-Mine Area is

approximately 60 acres, with most of that area comprised of grassland habitat associated with hydroseeding during reclamation activities. The total area of shrublands and grasslands within the Expansion Area is approximately 42 acres. The dominant shrublands species is the non-native invasive species Scot's broom. Scot's broom has been controlled in the Re-Mine Area during reclamation activities and would likewise be controlled throughout the site during mining and reclamation. This would benefit the existing adjacent native habitats and the riparian corridor of North Sequalitchew Creek by reducing invasive species pressure.

3.1.4 Aquatic Resources

The 1.8-acre Kettle Wetland is the only aquatic resource located within the South Parcel Project Area and is therefore the only aquatic resource that would potentially be disturbed by direct impacts associated with the proposed Project.

3.1.4.1 Kettle Wetland

The Kettle Wetland and its buffer would be cleared as part of the surface vegetation clearing. Thus, the entire wetland area (1.8 acres) would be eliminated. The Kettle Wetland relies on groundwater to sustain wetland vegetation so even if the Kettle Wetland were left in place within the Project area, the change in groundwater levels would eventually alter the hydrology of the Kettle Wetland, converting the wetland vegetation to upland plant species. Proposed mitigation for these wetland impacts is discussed in Section 3.4.

3.1.5 Rare Plants and Plant Communities

The Project would not directly impact rare plants or rare plant communities.

3.2 Fungi

The Proposed Action could reduce, fragment, and degrade existing habitat for mushrooms within the South Parcel and Kettle wetland buffer. The clearing of vegetation would remove decaying wood from the project area until trees in the reclaimed areas and wetland mitigation buffers reach maturity. The habitat conditions of the South Parcel are very similar to second growth forest common to the area, and this reduction in habitat would be considered an impact, but not a significant impact.

3.3 Animals

3.3.1 Birds

The Proposed Action could reduce and degrade existing foraging and breeding habitat for some bird species that use habitats within the South Parcel Project Area. The clearing of vegetation would increase the fragmentation and isolation of remaining habitats. The Project components with the

greatest potential impact on bird habitats are the clearing of vegetation from the South Parcel Project Area.

The clearing of currently vegetated areas would eliminate the existing foraging and breeding habitats for birds. In addition to direct loss of habitats, the clearing of vegetation could increase the fragmentation and isolation of remaining habitats. Reclamation of the mine slopes will continue to progress. The proposed Project will increase the acreage of reclaimed and reforested areas on the mine slopes by 177 acres.

The removal of the Kettle Wetland could disrupt bird habitat and reduce breeding, wintering, and migration habitat for bird species until habitat in the mitigation wetland is fully functional. Restored forests on reclaimed slopes are already maturing and would continue to provide new habitat to offset this impact.

3.3.2 Mammals

The proposed Project could alter habitat for mammal species within the Project area for reasons similar to those described for impacts to birds. The majority of species would disperse into adjoining habitats. The proximity of the Project area to similar intact habitats will provide dispersal routes as construction begins.

3.3.3 Amphibians and Reptiles

Within the Kettle Wetland, any existing amphibians would perish during the clearing of the surface vegetation and soils. New habitat with similar hydrology would be created in the mitigation wetland to compensate for these impacts.

3.3.4 Washington Department of Fish and Wildlife Priority Species

Removal of mature trees in the coniferous forest could reduce habitat for big brown bat, little brown bat, and Yuma myotis bat species. Clearing of forested areas within the South Parcel Project Area would reduce habitat that is thought to have once been within the historical range of gray squirrels but is unlikely to be occupied by the current population.

3.3.5 Threatened and Endangered Species

No ESA-listed species habitat would be altered directly as a result of the Proposed Action. See Anchor 2022 for more detailed analysis of the potential effects on fish species.

3.4 Indirect Impacts of the Proposed Action on Plants and Habitat

3.4.1 Conifer Forests

No potential indirect impacts to coniferous forest habitats outside the South Parcel Project Area associated with the proposed Project are anticipated.

3.4.2 Shrublands and Grasslands

No potential indirect impacts to shrublands and grasslands habitats outside the South Parcel Project Area associated with the proposed Project are anticipated.

3.4.3 Aquatic Resources

The aquatic resources of Sequalitchew Creek and the four wetland systems within the Restoration Area: East Edmond Marsh, West Edmond Marsh, and the Sequalitchew Creek Riparian Wetlands are within the area where wetland hydrology could be affected by changes in groundwater levels. The wetland hydrology of aquatic resources identified as Nearby Wetlands with the exception of the Seep Wetlands (Sequalitchew Creek Ravine Pond Lake, and Wetland 1D) could also be affected by changes in groundwater levels, but any effects are anticipated to be minor. The indirect effects of the Project on the Seep Wetlands are anticipated to be more severe. Groundwater seeps that support the hydrology of these wetlands would be reduced, resulting in a reduction or loss of wetland hydrology. The brackish marsh would not be affected by changes in groundwater levels due the dominance of tidal hydrology on that resource.

3.4.3.1 West Edmond Marsh and Wetland 1D

West Edmond Marsh and Wetland 1D are the two resources that are most likely to be affected by the proposed groundwater drawdown without implementation of the Restoration Plan. Due to the greater magnitude of the change in groundwater levels in these areas and the degree of connectivity between ground and surface water within these wetlands (City of DuPont 2007; Herrera Environmental Consultants 2005b; Aspect 2022). An analysis of the effects on these wetlands without mitigation indicates that the average water level in West Edmond Marsh would be 1.9 feet lower than under existing conditions. In wetter years, West Edmond Marsh would refill in the fall to similar elevations as under existing conditions but would dry up a month or two earlier in spring (see Figure F-6 in Appendix F of Aspect 2022). In drier years, the wetland seasonal high water levels would be 2 to 3 feet lower than under existing conditions, and in the driest years (e.g., 2005) the West Edmond Marsh is predicted to remain dry year-round. Earlier drying of saturated and inundated areas could have detrimental effects on the existing plant community. Wetland plant communities (and soils) are shaped by saturated and inundated conditions during the growing season (averages from March 1 to October 31) (Ecology 1997). Exotic plant invasion (particularly reed canarygrass)

favors this type of alteration when winter saturation and inundation are not sufficient to maintain existing plant communities or preclude noxious weed invasion.

Change of wetland areas along the margins of both wetlands (now saturated in the early spring) is unlikely. The jurisdictional wetland boundary is indicated by the presence of subsurface (within 12 inches below the soil surface) saturated conditions for 12.5% (approximately 30 or more consecutive days) of the growing season, as well as wetland soils and wetland plants (Ecology 1997). The high water levels in the marsh are currently controlled by the beaver dams in the system. Changes in groundwater elevation without mitigation would result in changes to surface water levels, which vary from year to year. In the wettest years, the wetland would still refill but would go dry one or two months earlier than under existing conditions. In drier years, the wetland would only partially refill, and the dry season would be extended. In the driest years, the wetland could remain dry year-round. These changes in reaching peak water levels are not anticipated to result in a loss of subsurface saturation for 30 days of the growing season within the current wetland boundary. The result of these hydrology changes to West Edmond Marsh during the spring would be changes in vegetation: Reed canarygrass would be expected to encroach farther into the wetland, whereas now it is limited to the wetland edge. Wetland shrubs would also be expected to advance toward slightly deeper areas of the wetland. The wetland boundary may or may not change, but in most areas the slopes are relatively steep, and any change would be relatively minimal. In a few areas where the wetland boundary is on flatter terrain it is possible that upland species could establish, thus reducing the size of the wetland in those locations. Typically, the wetland would still fill sufficiently to maintain hydrophytic vegetation at around the same elevation and meet the wetland hydrology criteria (Ecology 1997). It is more likely that a slow conversion of wetland habitats would occur; the changes could result in some conversion of aquatic wetland habitat to emergent wetland habitat and emergent wetland habitat to shrub-scrub wetland habitat.

3.4.3.2 East Edmond Marsh

An analysis of the drawdown effects on East Edmond Marsh indicates that there would be an average decrease in water level of 1.2 inches (Aspect 2022). The decrease would be greatest in June at about 1.5 inches and lowest in February at less than 0.1 inch. East Edmond Marsh would continue to follow the same seasonal pattern of fluctuation with the highest water levels in January through March and seasonal lows in August and September. It is unlikely that this change will have any measurable effect on the wetland given that this decrease would occur within a seasonal fluctuation in water level of more than 20 inches. Ultimately, continued beaver activity would have a far greater impact on water levels in the marsh.

3.4.3.3 Pond Lake

Pond Lake is an isolated water body, hydrologically connected to groundwater with little surface water inflow and no outflows. With the Proposed Action, the surface water level in Pond Lake is

conservatively projected to decrease by about 2 feet, the amount of groundwater drawdown in its vicinity. The surface water level in Pond Lake currently varies seasonally by up to 8 feet but more typically around 4 feet. Pond Lake goes dry in summer. With the Proposed Action, the seasonal variation would be 2 feet, and it would go dry a month earlier and rewet slightly later. Herbaceous vegetation in Pond Lake varies from year to year depending on when the water levels recede. With the Proposed Action the conditions observed during driest years would become common, with more emergent vegetation and less aquatic vegetation establishing. A sustained reduction in peak water levels could allow establishment of scrub-shrub wetland species along the wetland boundary and greater cover of reed canarygrass within the higher parts of the wetland. The relatively steep slopes around the wetland would prevent the wetland size from changing significantly.

3.4.3.4 Sequalitchew Creek and Riparian Forest Wetlands

Without restoration, Sequalitchew Creek west of Center Drive would experience reduced base flows as a result of reduction in seep and spring discharge caused by the drawdown of the Vashon Aquifer. A reduction of aquatic life would be expected to occur in the upper ravine without implementation of the Restoration Plan activities. More information on these effects is included in the *Fisheries Technical Report* (Anchor QEA 2022).

Without implementation of the Restoration Plan activities, the change in groundwater levels would eliminate the hydrologic support provided to the Sequalitchew Creek riparian forest wetlands, and some loss of the existing wetland vegetation would occur.

With implementation of the Restoration Plan activities, increased flows within Sequalitchew Creek are likely to cause changes to the existing stream morphology as a result of more energetic channel-forming processes more consistent with natural historical conditions. Current annual average flow rates in Sequalitchew Creek in the middle of the ravine are 1.0 to 1.6 cubic feet per second (cfs), with peaks near 5 cfs. Predicted flow rates of Sequalitchew Creek following implementation of the Restoration Plan are expected to average 11.2 cfs with peak flow during storm events that could reach near 60 cfs. These effects may cause some areas of existing wetland to be altered, although a net gain in water discharged to the riparian forest wetland is predicted to maintain or increase the total existing wetland area and increase hydrologic support throughout the growing season. The potential wetland alterations include conversion of wetland areas on the floodplain to active stream channels, loss of wetland vegetation nearer the existing channel and new wetland vegetation establishing farther from the existing channel. Some trees at the margins of the floodplain could fall due to increased inundation and the undermining of root systems, although fallen trees are also likely to contribute to large woody material in the stream which serves multiple ecological functions.

3.4.3.5 Sequalitchew Creek Ravine Seep Wetlands

With or without implementation of the Restoration Plan activities, dewatering of the aquifer is likely to indirectly impact the Seep Wetlands along the Sequalitchew Creek trail by disrupting the hydrology of these wetlands. These indirect impacts would result in the loss of wetland vegetation and function of the wetlands. The resulting loss in wetland area could be up to 0.13 acre of wetland habitat being converted to upland habitat due to insufficient saturation during the growing season.

Indirect impacts from changes in the aquifer would also affect the springs in the Sequalitchew Creek bed. These impacts could be mitigated by restoration. The effects on Sequalitchew Creek flow are described in Aspect 2022.

3.4.3.6 Brackish Marsh

The reduction in flows in Sequalitchew Creek resulting from dewatering of the Vashon Aquifer without implementation of the Restoration Plan are estimated at 1.3 cfs (Aspect 2022). While this is a significant fraction of the freshwater in the marsh, it would have little impact to the Brackish Marsh. The reduction in freshwater input would result in only a negligible increase in salinity in the marsh during high tides. Saltwater is denser than freshwater and the spatial extent of tidal flooding by saltwater would not be affected. Less freshwater input could result in changes in vegetation near the primary stream channel to more salt tolerant species. These changes would be subtle and may be difficult to detect. Alterations to the salinity elsewhere within the brackish marsh are predicted to be minor and would result in salinity values that are within the tolerance ranges for the existing plant communities documented in Anchor Environmental 2004a. No effect on the existing wetland is anticipated as a result of salinity alterations.

Increased flows associated with the implementation of the Restoration Plan would increase the rate of sediment transport to the lower ravine and brackish marsh. Historical alterations to the marsh including channelization of the stream and installation of a box culvert under the railway would direct sediment toward Puget Sound. Some fine sediment would continue to accumulate in the upper elevations of the intertidal marsh, which is part of the natural process of marsh formation and provides resiliency to sea level rise and episodic erosion.

3.4.3.7 Nearshore Springs

The springs that flow directly into Puget Sound express from the hillside near the toe of slope at the beach and there is no surface flow associated with these features within the South Parcel Project Area. No measurable change in groundwater flow from these springs is expected, and no impacts to these springs are expected as a result of the Proposed Action.

3.4.4 Animals

3.4.4.1 Birds

The alteration of wetland systems within the area subject to changes in groundwater level without restoration, particularly East and West Edmond Marsh, could disrupt bird habitat and reduce breeding, wintering, and migration habitat for bird species. These areas are documented to regularly attract concentrations of waterfowl (WDFW 2022a). However, the potential impacts to wetland area associated where changes in groundwater level is expected to be minor relative to the size of the wetland systems and in combination with the Restoration Plan activities.

3.4.4.2 Mammals

The alteration of Edmond Marsh and other wetland systems that could be modified by the changes in groundwater without mitigation could disrupt the existing wetland mammal habitat by removing existing water and food sources and sheltering vegetation, thereby reducing the available breeding and foraging habitat for aquatic habitat dependent mammal species (beaver). However, the potential reduction in wetland areas where changes in groundwater level are expected to be minor relative to the size of the wetland systems and in combination with the Restoration Plan activities. Use of the Seep Wetlands by mammals is unlikely, and a reduction in the size or the loss of the Seep Wetlands would have minimal effect due to the proximity of the much larger Sequalitchew Creek and its associated riparian areas, which provide superior mammalian habitat.

3.4.4.3 Amphibians and Reptiles

Loss of wetland area, alterations to seasonal inundation patterns, and subsequent changes in plant communities would reduce the area of habitats that support amphibians. These changes could indirectly disrupt amphibian habitat and reduce breeding, wintering, and foraging habitat for amphibian species.

The early drying of normally inundated areas could adversely affect amphibian breeding by lowering surface water levels during the breeding and rearing seasons. This could result in the loss of available habitat, leading to exposure of egg masses and rearing juveniles from reduced water levels. Tadpoles, juveniles, and adults may disperse to areas that remain inundated during early drying periods. However, the existing amphibian population likely uses all available habitats. Thus, unoccupied amphibian habitats are likely to be unavailable to individuals dispersing from drying portions of the wetlands. However, the potential reduction in wetland area associated with the changes in groundwater level is expected to be minor relative to the size of the wetland systems and in combination with the proposed Restoration Plan activities.

Proposed Restoration Plan activities would improve aquatic resource habitats within the Restoration Area compared to existing conditions that provide habitat for amphibian species.

3.5 Impacts of the No Action Alternative

3.5.1 Direct Impacts of the No Action Alternative to Plants and Habitat

Under the No Action Alternative, the South Parcel would not be mined and the property could be developed for manufacturing and research and residential uses under existing land use and zoning designations. The extent of development under the No Action Alternative projected is based on current zoning. The ultimate density of development would be controlled by Project-specific and regulatory elements such as setbacks, open space, and critical areas.

Under the No Action Alternative, development would occur consistent with the DMC Critical Areas chapter (DMC 25.105), which could allow for development withing 50 feet of the top of the Sequalitchew Creek ravine. Existing coniferous forest within the Expansion Area could be cleared under future development with landmark trees retained in accord with DMC requirements. There would be no changes in the use of the areas of the South Parcel zoned for Open Space; these areas currently include the naturally vegetated slope of the Sequalitchew Creek ravine and the Sequalitchew Creek pedestrian trail.

There would be no change in use of the areas within the existing mine. However, once the Re-Mine Area is reclaimed, it would likely be redeveloped according to its underlying zoning, similar to the South Parcel. The Kettle Wetland is within the existing mine and would remain intact, the buffers would remain vegetated, and mining operations would continue in other portions of the existing mine. The Kettle Wetland, its buffer, and other mine-related buffers could be reduced to the minimum width in the DMC.

3.5.2 Indirect Impacts of the No Action Alternative to Plants and Habitat

The Restoration Plan would not receive funding without the proposed Project and would not occur as part of the No Action Alternative. Under the No Action Alternative, the improvements and benefits to aquatic resource habitat proposed in the Restoration Area would not occur. Similarly, the impacts to groundwater associated with the Proposed Action would not occur.

3.5.3 Direct Impacts of the No Action Alternative to Animals

As described in Section 3.3.1, under the No Action Alternative, development could occur in the South Parcel Project Area resulting in clearing of forested and shrub habitat, reducing habitat for wildlife species that use these habitats. Direct impacts to animals would be similar to those described under Section 3.1.2.

3.5.4 Indirect Impacts of the No Action Alternative to Animals

Within the Restoration Area, wildlife species would not benefit from improved aquatic resource habitat conditions proposed under the Restoration Plan. The South Parcel would not undergo remediation from Tacoma Smelter Plume impacts leaving high concentrations of lead and arsenic in the soils.

3.6 Monitoring and Mitigation Measures

The Project proposes to mitigate for potential impacts to plants and animals and to monitor effects on surface water features and vegetation in areas that could potentially be affected. The Restoration Plan will be permitted and implemented contemporaneously with mining of the South Parcel. Among other things, the Restoration Plan will mitigate for the impacts of the mine. Monitoring and mitigation measures, including specific timeframes for monitoring and mitigation efforts, are defined in the Restoration Plan. The goal of the Restoration Plan is to offset potential impacts to aquatic resources within the area subject to changes in groundwater level.

Mitigation for impacts for the removal of the Kettle Wetland are identified in the Project *Wetland Mitigation Plan* (Anchor QEA 2021c). The design of the mitigation wetland complex is intended to create aquatic, wetland, riparian, and upland forest habitat by using groundwater intercepted within the mine. Specific Kettle Wetland mitigation goals include the following:

- Create a constructed palustrine depressional wetland complex consisting of forested, scrub-shrub, emergent, and aquatic bed wetland areas at least 3.56 acres in size.
- Provide adequate wetland acreage, functions, and values to mitigate all Project-related wetland impacts to the Kettle Wetland.
- Construct a vegetated buffer at least 100 feet around the boundary of the wetland.

Hydrologic changes will indirectly impact the Seep Wetlands; however, there will be no direct impacts (clearing, cut, or fill) to the wetland or its buffer. These changes will also not impact groundwater quality. The mitigation plan addresses these impacts through the creation of a larger complex of seep wetlands and springs within the mine. Springs and seeps will generally emanate on the eastern and southeastern slopes of the proposed mine in the South Parcel. Generally, seeps and springs will form within the lower one-third of the mine slope, approximately 20 to 30 vertical feet above the Olympia Beds.

Groundwater discharge will be greatest along the central and southern portion of the eastern slope and northeastern portions of the benches and will taper off to the north as the mine area approaches the Olympia Bed cutoff and to the south as the benches in the southeast corner get closer to the Sequalitchew Creek ravine. The specific locations of seeps and springs will depend on local variations in the outwash deposits related to silt content or areas of coarser materials. We can expect that there

will be localized areas of greater discharge and other areas with more distributed seepage or even little to no discharge.

This new seep wetland complex will be supported by approximately 7 cfs of groundwater expression through the slope. Quantitatively this is well over an order of magnitude more water than supports the ravine seeps. Within 1 year after active dewatering ends, the areas of the mine face that meet the criteria for wetland hydrology will be delineated. These areas will be colonized or planted with pioneer wetland species, such as horsetail *(Equisetum* sp.), buttercup (*Ranunculus* sp.), and miner's lettuce (*Montia fontana*). Additional species would be introduced later, once the soils have developed sufficiently to support seral grasses such as foxtails, rushes, sedges etc.

The buffers around these new seeps will be subject to the City of DuPont's Critical Areas Ordinance (DMC 25.105.050) and protected. The minimum buffer size is 50 feet. These buffers would be planted in accordance with the mine reclamation plan and monitored in accordance with the Wetland Mitigation Plan. Control of Scot's broom, reed canarygrass, Himalayan blackberry (*Rubus armeniacus*), and other noxious weeds within areas affected by the proposed Project would also be included as part of the Project mitigation activities.

3.7 Significant Unavoidable Adverse Impacts

3.7.1 Proposed Action

3.7.1.1 Direct Impacts

Significant unavoidable adverse direct impacts associated with the proposed South Parcel Project would be associated with the following Project elements:

- Drawdown of the Vashon Aquifer
- Clearing of vegetation from the proposed Re-Mine Area and Mine Expansion Area, including the removal of the Kettle Wetland and its buffer, and the removal of coniferous forest vegetation communities
- The clearing of currently vegetated areas would eliminate the existing foraging and breeding habitats for birds, mammals, and amphibian species. In addition to direct loss of habitats, the clearing of vegetation could increase the fragmentation and isolation of remaining habitats.

3.7.1.2 Indirect Impacts

Significant unavoidable adverse indirect impacts associated with the proposed South Parcel Project would be associated with the following Project elements:

- Drawdown of the Vashon Aquifer
- Loss of existing Seep Wetlands

Without restoration, drawing down the aquifer would reduce flows in Sequalitchew Creek to the extent that some flow would be subsurface. Changes in groundwater level could indirectly reduce the wetland area in Sequalitchew Creek riparian forest wetlands, West Edmond Marsh and Wetland 1D, and degrade wetland habitat in these wetlands due to early season loss of surface inundation and saturation in the early growing and breeding season. Aggradation of the brackish marsh could reduce the size and function of this wetland. The goal of the Restoration Plan is to offset potential impacts to these aquatic resources within the area subject to changes in groundwater level.

3.7.2 No Action Alternative

Future development consistent with underlying zoning could occur in the South Parcel Project Area resulting in clearing of coniferous forested and wetland habitat and reducing habitat for wildlife species that use these habitats. The clearing of currently vegetated areas could eliminate the existing foraging and breeding habitats for birds, mammals, and amphibian species. In addition to direct loss of habitats, the clearing of vegetation could increase the fragmentation and isolation of remaining habitats.

The Restoration Plan would not occur as part of the No Action Alternative. Under the No Action Alternative, the improvements and benefits to aquatic resource habitat proposed in the Restoration Area would not occur.

Drawdown of the Vashon Aquifer would not occur as part of the No Action Alternative. Under the No Action Alternative, the loss of the 0.15 acre of Seep Wetlands would not occur.

3.7.3 Monitoring of Dewatering Operations

A Monitoring Plan (Aspect 2017) has been prepared to observe and respond to changes in groundwater levels. The goals of that plan include the following:

1. Maintain groundwater at or above predicted levels beneath Edmond Marsh and Sequalitchew Creek.
2. Maintain groundwater conditions conducive to safe and efficient mining and processing of the South Parcel aggregates.

The document also includes a detailed adaptive management plan and a description of the relationship to the Adaptive Management Process for the Restoration Plan.

3.7.4 Monitoring of the Restoration Plan

Monitoring and adaptive management of the Restoration Plan are described within the plan (Aspect 2018). This plan includes performance thresholds that are tied to specific goals and objectives. The goals of that plan include the following:

1. Restore year-round flows in Sequalitchew Creek from Sequalitchew Lake to the mouth to support natural life history stages of native salmonid species that use the system.
2. Improve habitat conditions for native salmonid populations in the Sequalitchew Creek watershed.

Potential response actions are called out if specific performance thresholds are not met. In addition, there are aspirational thresholds identified that, if achieved, would indicate the plan's continued success.

4 Cumulative Effects of the Proposed Action and Restoration Plan

The South Parcel Project, described in Section 1.1, assumes implementation of the Restoration Plan, developed by CalPortland and Environmental Caucus, as a separate but related action. This Plan seeks to restore and enhance streamflow and ecological functions from Sequalitchew Lake through Edmond Marsh into Sequalitchew Creek ravine. The Restoration Plan is intended to sequentially restore diverted flows back to the creek, improve the sustainability of flows through the system, and restore aquatic habitat by removing flow-related fish passage barriers and increasing the habitat available to aquatic species.

Predicted water surface elevations and flows have been prepared to understand the specific cumulative impacts of mining and restoration. A thorough discussion of this analysis can be found in the Earth and Water Resources Report (Aspect 2022). The effect of these predicted changes on plants and animals is discussed below.

4.1 Restoration Plan Benefits

The restoration is a separate but related action, and its benefits and impacts will be evaluated comprehensively in a separate environmental review document. The assessment here is preliminary and provided to give context to the cumulative effects to the watershed. The mining and restoration projects would reverse many of the adverse impacts related to diversion of water from the Sequalitchew Creek watershed and creek that have occurred over many decades. The benefits would be noticeable over a large portion of the stream and wetland habitats in the basin and would largely restore lost and reduced ecosystem functions including the movement of water, sediment, nutrients, biota, and dissolved gasses through the watershed from the headwater springs on Sequalitchew Lake to Puget Sound. The reconnection of Sequalitchew Creek to its historical primary source of flow, Sequalitchew Lake, would address the root cause of the primary historical impacts to the system.

These projects have the potential to restore an annual average of 12.6 cfs to a 1,200-foot reach of Sequalitchew Creek that currently experiences little to no consistent flow (Aspect 2022). Seasonally, the flows in this reach are predicted to be between 2.5 cfs in August up to just over 25.7 cfs in March. Flows of this magnitude would re-establish a functioning stream in the now frequently dry channel, providing new aquatic and riparian habitat and a connection between the Sequalitchew Creek ravine and the marshes. This would provide a corridor for both aquatic and terrestrial species and would provide new opportunities for species expansion and recovery.

In the Sequalitchew Creek ravine, the restoration and mining projects would result in a seven-fold increase in flow on an annual average basis, from the current 1.6 cfs up to 12.9 cfs. Peak flows could reach up to 65 cfs, sufficient to restore the natural channel-forming processes necessary to improve

habitat conditions in the ravine. Currently, the flows in the ravine are inadequate to move sediment effectively, create pools, or scour finer-grained materials from the substrate to create conditions suitable for spawning. Peak flows could be adaptively managed by adjusting the weir at the Diversion Canal and limiting flow through Edmond Marsh to prevent flooding or detrimental effects to the wetlands or the stream channel.

The restoration project would also have some direct benefits to the wetlands. Specifically, it would raise the water level in Hamer Marsh, expanding its size; remove fill and improve aquatic habitat conditions at the Lake Outlet Area; and reconnect East and West Edmond marshes by replacing a portion of the Robinson Trail separating the marshes with a bridge. Conditions in much of the marsh today favor a scrub-shrub plant community. Restoration would also reduce fluctuation in water surface through the growing season near the railroad grade allowing enlargement of the forested wetland community. Restoration would affect the conditions sufficiently to allow establishment of emergent vegetation in the western extent of the complex where inundation will persist through more of the growing season and could result in the formation of forested wetlands in East Edmond Marsh where water levels would be reduced and fluctuate less throughout the year. These effects would increase the diversity and complexity of habitats.

The greatly increased flow through Edmond Marsh would also improve water quality conditions by increasing dissolved oxygen concentrations and diluting and flushing an area of elevated iron concentrations in the center of the marsh.

4.2 Impacts of Restoration

Restoring the natural flow regime to the Sequalitchew Creek watershed, in combination with lower groundwater levels resulting from mining, would result in several impacts: a reduction in wetland area, increase in summer stream temperatures, and increased frequency of periods of high flow in winter and spring.

Water levels in Eastern East Edmond Marsh and Edmond Marsh would return to water levels more consistent with recent history but would result in a loss of current wetland area. At present the East Edmond Marsh wetlands are larger and deeper than they have been in the past several decades as a result of beaver activity and the secondary outlet for flow provided by the Diversion Canal. Water surface elevations in East Edmond Marsh are currently higher than in Sequalitchew Creek. Lowering the water levels in some areas of the marshes is necessary to restore flow from Sequalitchew Lake, as the marsh water levels are currently higher than the lake forcing water to flow into the Diversion Canal instead of Sequalitchew Creek.

The flow from Sequalitchew Lake is also warmer in summer than the current flow in the ravine. The Project would represent a return to a more natural, surface-flow-dominated condition, but one with

warmer stream temperatures that could approach or exceed biological criteria for coho salmon (*Oncorhynchus* kisutch) during much of the spring and summer months. Water originating from Sequalitchew Lake is warmer than groundwater because it is warmed by the sun in the lake and this water would be further warmed as it slowly flows through the marshes.

Finally, there are predicted to be infrequent periods when the mining and restoration projects would result in streamflows that are lower than currently occur. This condition would occur during extended dry periods, when outflow from Sequalitchew Lake is naturally low or non-existent. Streamflows would be lower than existing conditions about 10% of the time, typically in August and September of particularly dry years. Existing flows during these periods currently average 0.83 cfs and do not provide aquatic habitat for anadromous fish; mining and restoration would further reduce these flows by more than half during these periods (to 0.44 cfs).

4.3 Cumulative Effects

This section identifies cumulative effects on biological resources for the Proposed Action and implementation of the Restoration Plan. Cumulative effects analysis is an evaluation of the combined effects on biological resources for the Proposed Action and present and reasonable and foreseeable projects in the vicinity of the study area. This analysis is focused on Sequalitchew Creek and the wetlands. Potential restoration activities of stream and wetland habitats in the Sequalitchew Creek watershed upstream of the Restoration Plan area at the JBLM would not occur without the proposed Restoration Plan activities downstream of the JBLM. Upland areas would be only minimally affected by restoration. Each section is organized to discuss aquatic habitat first, followed by water quantity, then water quality.

4.3.1 Sequalitchew Creek

The combined effects of proposed mining and restoration plan projects on stream habitat would include a re-establishment of flow from Sequalitchew Lake to flow through the marshes and into Sequalitchew Creek ravine. The projects would also result in re-establishing the ecosystem process, specifically, the movement of water, sediment, nutrients, biota, and dissolved gasses through the watershed from the headwater springs on Sequalitchew Lake to Puget Sound. The increase in hydrology and stream energy would increase aquatic ecosystem productivity and create and maintain habitat diversity.

Re-establishment of peak flows and the associated sediment movement is key to restarting the arrested habitat-forming processes downstream of Edmond Marsh and a key objective of the Restoration Plan. Currently, even where flows persist perennially, they are inadequate to move sediment effectively, create pools, or scour finer-grained materials from the substrate to create conditions suitable for spawning. The input of sediment and organic matter will stimulate biological productivity and develop greater resources at the lower trophic levels. Restoration would also result

in pool and riffle habitat formation over time. This habitat and development of lower trophic productivity are key to developing conditions sufficient to restore target species such as chum (*Oncorhynchus keta*) and cutthroat trout (*O. clarkii*) in the system. Chum will also benefit from the restoration of a more varied hydrograph. Puget Sound stocks typically spawn in freshwater systems in November and December as flows rise in response to winter rains. This effect has been limited in the system due to the current lack of surface water connectivity. The *Dupont Aggregates South Parcel Project Fisheries Technical Report* (Anchor QEA 2022) contains additional information and assessment of the impacts to fisheries from the Proposed Action and the No Action Alternative.

4.3.1.1 Flow

The cumulative effect of the mining and restoration projects on streamflow was evaluated by predicting streamflows at two locations: in the dry reach between West Edmond Marsh and Sequalitchew Creek ravine, and in Sequalitchew Creek at the mid-ravine gage.

4.3.1.1.1 Dry Reach

Under existing conditions, the dry reach currently experiences no consistent flow passing through the entire reach. The bottom of the dry reach is above the current groundwater levels, so ground infiltration in the dry reach would not be affected by lowering of groundwater with mining.

The mining and restoration projects are predicted to result in an average flow of 12.6 cfs in the dry reach. The flow would vary seasonally from a monthly average of 2.5 cfs in August to 25.7 cfs in March as shown in Figure 5. Peak flows could be as high as 65 cfs if all water is routed through the wetlands during peak flow events. To avoid flooding during peak flows, the highest flows could be directed to the Diversion Canal or detained in the marshes. The results presented here do not account for the diversion of peak flows or detention in the marshes.

Streamflow in the dry reach was calculated by adjusting the daily average outflows from Sequalitchew Lake from 2003 to 2021 by the estimates of the gains or losses that would occur in the wetlands based on the results of the water balance model summarized in the Section 4.3.2, Wetlands, and presented in detail by Aspect Consulting (Aspect 2022). The dry reach was assumed to have a sealed bed under restored conditions (either naturally or through contingent actions), so no gains or losses were assumed to occur in the dry reach.

Modeling indicates there would be periods when there would be no outflow from West Edmond Marsh, as thus no flow in the dry reach. Water balance model results, based on hydrologic conditions observed over the 19-year period of record, indicate that water would not flow through the dry reach due to dry conditions on 401 days (or 7.7% of the time). These dry periods were predicted to last for multiple weeks to several months and occurred in five of the 19 years simulated by the model (2004, 2005, 2015, 2017, and 2018). The occurrence of these dry periods could be reduced or eliminated if

beaver management structures are built to store water and release it slowly and consistently during periods when there is no flow from Sequalitchew Lake.

4.3.1.1.2 Sequalitchew Creek at Mid-Ravine Gage

After passing through the dry reach, streamflows would enter the Sequalitchew Creek ravine. The vast majority of flow would originate from Sequalitchew Lake, but there would be contribution from springs within the ravine. Spring contribution related solely to the Vashon Aquifer would be reduced by approximately 79% (Aspect 2022). This flow would be augmented by the addition of new hyporheic input from streamflow restoration in the dry reach. Aquitards at the existing springs would force both sources of water in the aquifer to the existing springs.

Streamflows in Sequalitchew Creek ravine were predicted at the mid-ravine gage location (formerly known as the "upper gage") for comparison with the existing gage record. Streamflows were predicted by starting with the flows predicted for the dry reach, as described above, and adding in spring flow occurring in the upper portion of the Sequalitchew Creek ravine.

Spring flow in the upper reaches of the Sequalitchew Creek ravine would be affected by the lowered groundwater levels associated with mining. The groundwater model results for Step 4 of dewatering, the long-term condition that would persist after active dewatering has ceased, predict a reduction in spring flow of 79%, varying from 73% in January to 86% in summer. The reduction in spring flow was accounted for by scaling the average daily flow records from the mid-ravine gage record by the corresponding monthly percent reductions in spring flow. The scaled-down spring flow was then added to the predicted dry reach flow to create the predicted flow at the upper gage with mining and restoration.

On average, flow in Sequalitchew Creek at the mid-ravine gage would generally be similar to but slightly higher than the flows in the dry reach (i.e., 0.4 cfs greater), reflecting the input of spring flow. The annual average flow at the upper gage would be 12.9 cfs. Monthly average flows would range from 2.5 cfs in August to 26.3 cfs in March as shown in Figure 5. Peak flows would be generally the same magnitude (approximately 60 cfs) as in the dry reach.

There would be periods when the cumulative effects of the mining and restoration projects would result in a reduction in flows at the mid-ravine gage when compared with the existing condition. Of the 19 years evaluated, flows would be lower with the projects during 45 periods, lasting a total of 475 days, or about 10% of the time. Included in this tally are 24 additional days when there would be no flow at the mid-ravine gage. Under existing conditions, there were 7 days with no measurable flow at the gage. As noted above, these effects could be mitigated in part or in whole by careful implementation of the beaver management actions called for in the Restoration Plan

The median duration of a period when flows would be lower with mining and restoration (hereafter referred to as a "lower flow event") was 3 days, but there were seven lower flow events lasting more than 2 weeks long. The longer events occurred in 6 of the 19 years simulated (2004, 2005, 2015, 2016, 2017, and 2018). The longest single lower event was 98 days ending in October 2017. However, lower flow events dominated the summer and fall of 2005, when there were four lower flow events between July 20 and December 23 lasting a total of 134 days. Lower flow events occurred most commonly in July, August and September, but occasionally occurred all months except March. The average streamflow during lower flow events was 0.83 cfs under existing conditions and would be 0.44 cfs with mining and restoration. The decrease in streamflow during lower flow events ranged from 0.1 cfs up to 1.6 cfs. Again, these effects could be mitigated in part or in whole by careful implementation of the beaver management actions called for in the Restoration Plan.

4.3.1.2 Sequalitchew Creek Temperature

The mining and restoration projects would affect stream temperature in the Sequalitchew Creek ravine by introducing a large quantity of water from a source with a different temperature. The effects would vary seasonally as the volume of water from Sequalitchew Lake and its associated temperature varies. In summer, the outflow from Sequalitchew Lake is warmer than Sequalitchew Creek; in winter, it is colder.

Sequalitchew Creek would experience warm temperatures in June, July and August, with temperatures reaching up to 21°C (70°F) and cool temperatures in winter, down to 5°C to 6°C (41°F to 43°F) as shown in Figure 6. The predicted stream temperatures would be considerably warmer than the current spring discharge in the creek for most of the year. The surface water quality criterion for temperature applicable to Sequalitchew Creek is 16°C for the 7-day average of daily maximums. The analysis based on grab samples suggests that this threshold may be exceed from May to September.

Historically, the stream temperatures in Sequalitchew Creek were likely closer to those observed today in the lake outflow, and the steady, cool temperatures currently observed in the ravine reflect the proportionally greater input of groundwater resulting from diversion of the lake outflow from the system.

The change in stream temperature was evaluated quantitatively on a monthly basis by using a linear mixing equation with the observed temperatures for Sequalitchew Lake (with 1°C added to account for warming in the marshes) and Sequalitchew Creek, and the estimated future flow rates from each source. A discussion of the impacts of these changes in stream temperature on fisheries can be found in the *Dupont Aggregates South Parcel Project Fisheries Technical Report* (Anchor QEA 2022).

4.3.2 Wetlands

The Sequalitchew Marsh wetland complex has increased in size by more than 30 acres since the late 1990s when efforts to maintain a channel through the system were abandoned, and beaver dams began to raise water levels, preventing flow from reaching the ravine and redirecting nearly all flow to the Diversion Canal (Figure 3). A fundamental goal of the Restoration Plan is to direct flows from the Diversion Canal back down Sequalitchew Creek. This requires restoring the historical gradient from the outlet of Sequalitchew Lake to the top of the ravine. This will necessarily require a lowering of water levels in some parts of the wetland complex resulting in a reduction of wetland acreage.

During the Restoration Plan stakeholder process, the tradeoff between wetland impacts and creek flow was considered, and the stakeholders recommended an aggressive approach to increasing gradient to improve creek flows over a less aggressive approach to maintain wetland acreage and potentially sacrifice some creek flow (SPSSEG 2014). The restoration of flow using flexible levelers in beaver dams would limit the losses of wetland area and wetland function relative to the approach used in the 1980s when an open channel was maintained through the system. Wetland conditions in the 1980s are representative of a more aggressive approach to maintain the gradient and flow through the system. Aerial imagery and wetland delineations from around that period are useful in understanding the habitat conditions at the extreme of effects that could occur as a result of the restoration project. Flexible levelers can also be designed in such a way as to limit high flows by storing water behind beaver dams and release more water during periods when flows from upstream (Sequalitchew Lake) are low.

Some wetland and lake fringe habitats would be gained. Raising water levels in Hamer Marsh would compensate for some wetland loss. Removing fill from Edmond Marsh would compensate for some wetland loss and more importantly improve connectivity and function in the wetland.

Wetland functions and values have been quantified using metrics developed by Ecology. These include wetland rating scores and a hydrogeomorphic assessment methodology. Predictions of the effects on habitat, water quality, and hydrology were reviewed against the scoring criteria. In general, the changes related to the cumulative effects of mining and restoration were not sufficient to change scores. Of note is that the restoration of flow between Edmond Marsh and the ravine provides the opportunity to improve wetland functions and values to existing habitats in the ravine, brackish marsh and stream delta.

Cumulatively, the wetland restoration project and mine project would result in a significant but unavoidable loss of wetland acreage. Comparing existing wetland acreage to conditions in the 1980s, when every effort was made to channelize the wetlands to improve flows and no effort was made to maintain wetland acreage in the system, likely provides a conservative estimate of potential wetland loss that could result from the projects. Careful management of flexible levelers would minimize the

lost wetland acreage, allow for a greater diversity of wetland habitats in the complex, and most importantly develop greater ecosystem connectivity.

4.3.2.1 Marsh Water Levels

As outlined in the Restoration Plan, reconnecting flow from Sequalitchew Lake to the Sequalitchew Creek ravine will require lowering water levels in some areas of the marshes in order to establish a consistent downhill gradient. Currently, the water levels in Eastern East Edmond Marsh and East Edmond Marsh are higher than the typical lake level of about 211.5 feet, preventing any outflow from the lake from reaching the marshes. Restoration would create a gradient in Eastern East Edmond Marsh and in Edmond Marsh from elevation 2010.5 to 206.5 feet (North American Vertical Datum of 1988).

These target elevations are significantly lower than the current water levels in these marshes. A comparison of the existing and future marsh water levels is shown in Figure 5. The target water levels of the mining and restoration scenario achieve a difference in water surface elevations of 5 feet between the lake (typically 211.5 feet) and West Edmond Marsh (target elevation 206.5 feet). Over the 8,700-foot flow path through the marshes, these water levels would result in a hydraulic gradient of 0.0006%. This is a very low gradient, and streams in systems with similar gradients are often characterized by containing broad shallow channels, or multiple threaded channels. One or more broad (more than 20 feet), shallow (less than 2 feet) channels at this gradient would have sufficient capacity to convey the peak outflows from Sequalitchew Lake. Peak flow velocities in this system would be low (less than 1 foot per second).

The results of a water balance model, developed for the marshes to evaluate the combined effects of the restoration and mining projects, was developed based on an assumption that there would be little variation in wetland water levels with the projects, as there would almost always be more than enough flow from Sequalitchew Lake to keep the wetlands full to their target elevations. However, there are several summers during the simulation period when water levels in Eastern East Edmond Marsh would dip below the target elevations for a month or more. East and West Edmond Marshes would also experience occasional dips below the target elevation, but of lesser magnitude and much less frequently. These impacts could be reduced or eliminated by managing water level behind the beaver dams to store water and release it slowly during periods of low flow. The hydraulic gradient through the marshes would always be maintained, however, as the water level in Eastern East Edmond Marsh never dips below the water level in East Edmond Marsh allowing water stored in the marsh to flow downstream to the ravine.

A second key output of the water balance model is an understanding of the gains or losses in flow that would occur as it passes through the marshes. As water travels through the marshes, it would

still be subject to potential gains from precipitation, stormwater inflows, or discharge from groundwater, and losses to evapotranspiration or infiltration.

Model results indicate that most months of the year (March through October), the wetland system would experience the loss of a small amount of the flow from Sequalitchew Lake, ranging from a 1% loss in October up to 24% in loss in July. However, in the wetter months (November through February) some flow would be gained in the wetlands from surface water and groundwater inflows. Gains range from 2% in February up to 9% in December. These monthly average losses were used in the predictions of streamflow in the dry reach and Sequalitchew Creek ravine described above. The water balance model simulates the individual hydrologic processes that effect the wetlands, including precipitation, evaporation, surface inflows and outflows, subsurface flows, and groundwater recharge and discharge. The model predicts water level conditions on a monthly basis from 2004 to 2021, representing a range of climate conditions. The model was calibrated to observed water levels over that period and was able to closely reproduce the water levels, typically matching the observed water levels within 2 to 3 inches. For all wetlands, the model was able to reproduce the seasonal pattern of water levels and capture differences between wetter and drier years (e.g., the model accurately simulated years where West Edmond Marsh was completely dry in summer versus years where some water remained). Generally, the model fit is best for Hamer, East and West Edmond Marshes and weakest for Eastern East Edmond Marsh. Additional details about the development and use of the water balance model are presented in Aspect Consulting (Aspect 2022).

4.3.2.2 Wetland Water Quality

The proposed mining and restoration projects would benefit the water quality in Eastern East Edmond Marsh and Edmond Marsh by providing a high volume of high-quality water. The anticipated changes were evaluated qualitatively by comparing the water quality conditions in the outflow from Sequalitchew Lake with water quality conditions in the marshes.

With the mining and restoration projects, the residence time in the wetlands would reduce significantly, decreasing from weeks or months to days. Water quality in the wetlands would be dominated by the input from Sequalitchew Lake. As a result, dissolved oxygen would be higher, and the pH would be slightly more neutral. Temperature and turbidity have been about the same in the lake and marshes, so little change would be anticipated.

It is anticipated that the elevated iron concentrations observed in the center of Edmond Marsh would be resolved through flushing and dilution with Sequalitchew Lake water. The iron concentration in the outflow from Sequalitchew Lake has been measured on only one occasion (at 0.13 milligrams per liter [mg/L]), at a concentration below the elevated levels of 3 to 5 mg/L observed in Edmond Marsh near the railroad trail bridge and related seeps. While there is no state water quality criterion for iron in surface waters, British Columbia has established a water quality guideline for total iron of 1 mg/L

in surface water (Phippen et al. 2008). The marshes receiving flow from Sequalitchew Lake could be expected to have future iron concentrations near, but slightly above, the concentration in the lake, which based on the single observation, would be below 1 mg/L.

4.4 Cumulative Impacts to Specific Resources

The Restoration Plan, developed by CalPortland and the Environmental Caucus, seeks to restore and enhance streamflow and ecological functions from Sequalitchew Lake through Edmond Marsh into Sequalitchew Creek ravine. Restoration of Sequalitchew Creek seeks to address almost two centuries of human manipulation. The principal goals of the Restoration Plan are to restore flows in Sequalitchew Creek, portions of which are now dry. This goal will be achieved by implementing a series of actions in a coordinated and adaptively managed project. The Restoration Plan is intended to sequentially restore diverted flows back to the creek, improve the sustainability of flows through the system, and restore aquatic habitat by removing flow-related fish passage barriers and increasing the habitat available to aquatic species.

4.4.1 Cumulative Impacts to Conifer Forests

The restoration of the watershed would allow the re-establishment of conifer forests around the perimeter of Edmond Marsh. These forests have been recently lost to raising water levels, particularly on the northern boundary of East Edmond Marsh. Other impacts would be similar to those described in Sections 3.1.1 and 3.3.1.

4.4.2 Cumulative Impacts to Landmark Trees, Shrublands, and Grasslands

The implementation of the Restoration Plan would not further affect landmark trees, shrublands, or grasslands in the Project area or Project vicinity.

4.4.3 Cumulative Impacts to Aquatic Resources

The four Restoration Area Wetlands would be affected by implementation of the Restoration Plan. West Edmond Marsh and East Edmond Marsh would both experience changes in wetland hydrology. As the hydraulic gradient between Sequalitchew Lake and the west end of West Edmond Marsh is restored, the area of jurisdictional wetland and seasonal inundation will decrease in most locations. This is necessary to restore flows and reverse the effects of water diversion and beaver activity that has occurred since the 1990s. The creation of a gradient will allow flows out of Edmond Marsh, provide fish passage through the majority of the watershed, and improve water quality in the system.

4.4.3.1 West Edmond Marsh

West Edmond Marsh will be more frequently and continuously inundated in the deeper areas of the wetland, and seasonal fluctuations in water levels will decrease. This will occur as a lower and more

stable outlet hydrology is established in place of the existing beaver dam. The beaver dam currently prevents flow out of West Edmond Marsh, but it is occasionally breached.

Reducing or eliminating these rapid changes in hydrology will help to stabilize the vegetation communities which are currently susceptible to hydrologic fluctuations. Currently scrub-shrub wetland vegetation establishes in the marsh over several years only to be killed off when water levels rise. Emergent vegetation is not able to establish under the dead woody material before changes in water levels once again favor a scrub-shrub community.

4.4.3.2 East Edmond Marsh

Water levels in East Edmond Marsh are currently higher than in Eastern East Edmond Marsh and West Edmond Marsh. This reverses the gradient of Sequalitchew Creek preventing surface flow to the ravine from West Edmond Marsh. The restoration will lower water levels in East Edmond Marsh to restore a gradient from Lake Sequalitchew to the ravine. This will impact habitats, particularly along fringes of the wetland where forested areas will be able to re-establish. Forested wetland and wetland buffer has been lost over the past decades as water levels have risen. Rising water levels have also been responsible for the loss of scrub-shrub vegetation and detritus from those communities has prevented establishment of an emergent vegetation community.

4.4.3.3 Sequalitchew Creek Ravine Wetlands

The Sequalitchew Creek Ravine Wetlands will be affected as flows in the creek are restored. This will cause a change in the bankfull width of Sequalitchew Creek as well as the sediment load being actively transported downstream. Over the subsequent several decades the riparian and floodplain wetland communities will be affected by deposition of new floodplain terraces, channel migration, increased wet season flows and other natural stream processes.

4.4.3.4 Brackish Marsh

Due to the increased base and peak flows in Sequalitchew Creek, the brackish marsh at the mouth of Sequalitchew Creek are likely to be affected by increased sediment inputs and decreased salinity due to increased volumes of fresh water discharging into the wetland.

Increased sediment inputs into the brackish marsh due to increased flows in Sequalitchew Creek could modify the existing wetland topography, and as a result, the existing vegetation. Sedimentation would be minimized by controlling the discharge into Sequalitchew Creek during implementation of the Restoration Plan to prevent a rapid mobilization of sediments in the stream reaches upstream of the brackish marsh. Water discharge would be slowly increased to allow the channel and stream bank vegetation to adapt to the increased flow rates. The existing condition of sediments in the brackish marsh (dominance of cobbles and gravels in the channels) indicate that the existing input of fine-textured sediments is flushed during ebb tides. With appropriate upstream

mitigation, changes in sediment loading to the brackish marsh are expected to be minimal and would be further minimized by tidal flushing.

Salinity in the marsh will continue to be driven by tidal inflows and decreases in salinity associated with freshwater flows would only be expected during high flow events in winter months. Increased flow in Sequalitchew Creek with the Restoration Plan activities is not expected to affect existing brackish marsh vegetation or functions.

4.4.3.5 Other Wetlands

Restoration is not expected to have significant effects on the Nearshore Springs or Nearby Wetlands.

4.4.4 Cumulative Impacts to Birds

Implementation of the Restoration Plan will reverse the changes in bird habitat in East and West Edmond Marsh that have occurred over the last three decades. This will include a reorganization of some specific habitats include scrub-shrub wetlands and forested wetlands. It will increase the area of forested wetland buffer as water levels in some areas of East Edmond Marsh drop and increase the amount of and persistence of emergent wetland habitat in the west end of West Edmond Marsh.

4.4.5 Cumulative Impacts to Mammals

Beaver in the Edmond Marsh complex will be actively managed as part of the Restoration Plan. The intent is to maintain the beaver population while managing water levels to restore flow. Other mammal species are expected to see increases in available habitat, particularly where water levels drop providing additional denning opportunities in the wetland banks and increasing the size of upland islands within the wetland complex.

4.4.6 Cumulative Impacts to Amphibians and Reptiles

Amphibian reproduction can be adversely affected by sudden, non-seasonal changes in water levels. This occurs in West Edmond Marsh when the large beaver dam above the dry reach is breached. Amphibian eggs attached to the stalks of emergent vegetation will suddenly be above water, causing complete mortality. Areas of reduced wetland area in the Edmond Marsh complex could reduce the area of habitat for some amphibian species, while others would benefit from the re-establishment of the forested riparian buffer.

Little Brown Bat	N/A	N/A	Yes
Yuma myotis	N/A	N/A	Yes

PHS Species/Habitats Details:

Western gray squirrel	
Scientific Name	*Sciurus griseus*
Priority Area	Occurrence
Site Name	JBLM
Accuracy	GPS
Notes	WESTERN GRAY SQUIRREL NEST IN PIPO
Source Record	113567
Source Dataset	WS_OccurPoint
Source Date	WS_OccurPoint
Source Name	UNKNOWN/WDFW
Source Entity	WA Dept. of Fish and Wildlife
Federal Status	N/A
State Status	Threatened
PHS Listing Status	PHS Listed Occurrence
Sensitive	N
SGCN	Y
Display Resolution	AS MAPPED
ManagementRecommendations	http://wdfw.wa.gov/publications/pub.php?id=00027
Geometry Type	Points

Coho	
Scientific Name	*Oncorhynchus kisutch*
Priority Area	Occurrence/Migration
Site Name	Sequalitchew Creek
Accuracy	NA
Notes	LLID: 1226656471169, Fish Name: Coho Salmon, Run Time: Unknown or not Applicable, Life History: Anadromous
Source Record	50424
Source Dataset	SWIFD
Federal Status	N/A

DISCLAIMER. This report includes information that the Washington Department of Fish and Wildlife (WDFW) maintains in a central computer database. It is not an attempt to provide you with an official agency response as to the impacts of your project on fish and wildlife. This information only documents the location of fish and wildlife resources to the best of our knowledge. It is not a complete inventory and it is important to note that fish and wildlife resources may occur in areas not currently known to WDFW biologists, or in areas for which comprehensive surveys have not been conducted. Site specific surveys are frequently necesssary to rule out the presence of priority resources. Locations of fish and wildlife resources are subject to variation caused by disturbance, changes in season and weather, and other factors. WDFW does not recommend using reports more than six months old.

Appendix B
Tables of Plant and Animal Species Surveyed in the Project Area

Appendix B
Plants Identified In and Around the Proposed Action

Species	Common Name	Coniferous Forest	Kettle Wetland and Buffer	Disturbed Areas	Bluff	Open/ Grassland	Brackish Marsh
Plants							
Acer macrophyllum	bigleaf maple				x		
Toxicodendron diversilobum	Pacific poison oak				x		
Oenanthe sarmentosa	water parsley		x				
Perideridia sp.	yampah		x				
Apocyrum androsaemifolium	spreading dogbane	x			x		
Asarum caudatum	British Columbia wildginger	x					
Achillea millefolium	common yarrow				x	x	x
Nothocalais sp.	false-dandelion				x		
Anaphalis margaritacea	western pearly everlasting			x	x		
Artemisia californica	coastal sagebrush	x			x		
Artemisia sp.					x		
Symphyotrichum subspicatum	Douglas aster						x
Cirsium vulgare	bull thistle			x			
Cotula coronopifolla	common brassbuttons						x
Pseudognaphalium canescens ssp. *Microcephalum*	Wright's cudweed			x	x	x	
Grindelia sp.	gumweed						x
Leucanthemum vulgare	oxeye daisy			x			
Hieracium sp.	hawkweed			x	x	x	
Senecio jacobaea	tansy ragwort (stinking willie)				x		
Senecio sp.	senecio			x	x		
Solidago canadensis	Canadian goldenrod			x			
Achlys triphylla	vanilla-leaf	x					
Berberis aquifolium	hollyleaved barberry/Oregon grape	x		x	x		
Berberis nervosa	Cascade barberry				x		
Alnus rubra	red alder	x					
Corylus cornuta	beaked hazelnut/beaked hazel/western hazel	x			x		
Lepidium sp.	pepperweed				x		
Campanula scouleri	pale bellflower				x		
Linnaea borealis	twinflower	x		x		x	
Lonicera ciliosa	orange honeysuckle			x	x		
Sambucus nigra ssp. *cerulea*	blue elderberry			x	x	x	
Sambucus racemosa	red elderberry			x			
Symphoricarpos albus	common snowberry	x	x	x	x		
Moehringia macrophylla	largeleaf sandwort				x		
Cerastium sp.	chickweed			x			
Paxistima myrsinites	Oregon boxleaf			x			
Chenopodium album	fat hen/white goosefoot/common lambsquarters						x
Salicornia sp.	pickleweed						x
Cornus sericea	redtwig dogwood/redosier dogwood		x				
Marah oregana	Oregon bigroot/coastal manroot/western wildcucumber					x	
Carex deweyana	Dewey's sedge	x					
Carex lyngbyei	Lyngbye's sedge						x
Carex obnupta	slough sedge		x				
Carex inops	long-stolon sedge			x		x	
Luzula sp.	woodrush			x			
Arbutus menziesii	Pacific madrone			x	x		
Arctostaphylos uva-ursi	bearberry	x		x		x	
Gaultheria shallon	salal	x			x		
Vaccinium ovalifolium	oval-leaf huckleberry/oval-leaf blueberry/Alaska blueberry				x		
Vaccinium ovatum	evergreen huckleberry	x			x		
Vaccinium parvifolium	red huckleberry	x					
Cytisus scoparius	Scot's broom	x	x	x	x	x	x
Lupinus sp.	lupine				x		
Vicia sp.	vetch	x			x		

Appendix B
Plants Identified In and Around the Proposed Action

Species	Common Name	Coniferous Forest	Kettle Wetland and Buffer	Disturbed Areas	Bluff	Open/ Grassland	Brackish Marsh
Quercus garryana	Oregon white oak	x		x		x	
Centaurium erythraea	European centaury			x			
Ribes sanguineum	redflower currant			x	x		
Ribes watsonianum (?)	spring gooseberry					x	
Hypericum perforatum	common St. John's wort			x	x	x	
Hypericum sp.	St. John's wort	x			x	x	
Juncus bufonius	toad rush		x				
Juncus effusus	soft rush/lamp rush/common rush		x				x
Lycopus sp.	water horehound		x				
Mentha sp.	mint		x				
Micromeria douglasii	yerba buena				x		
Maianthemum stellatum	starry Solomon-plume/starry false lily of the valley/false Solomon's seal				x		
streptopus amplexifolius	clasping-leaved twisted-stalk/clasping twistedstalk/twisted stalk/claspleaf twistedstalk					x	
Nuphar polysepala	spatterdock/Rocky Mountain pond-lilly			x			
Chamerion sp.	fireweed				x		
Goodyera oblongifolia	rattlesnake-plantain					x	
Abies grandis	grand fir	x					
Pseudotsuga menziesii	Douglas-fir	x		x	x	x	
Tsuga heterophylla	western hemlock	x					
Plantago lanceolata	narrow-leaf plantain			x		x	x
Aira praecox	early hairgrass/yellow hairgrass			x			x
Elymus repens	quackgrass			x		x	x
Agrostis stolonifera	creeping bentgrass						x
Agrostis capillaris	colonial bentgrass		x	x		x	
Agrostis sp.	bentgrass						x
Dactylis glomerata	orchard grass					x	
Deschampsia cespitosa	tufted hairgrass						x
Schedonorus arundinaceus	tall fescue	x		x			
Festuca sp.	fescue			x			
Holcus lanatus	velvetgrass/common velvetgrass			x	x	x	x
Lolium sp.	ryegrass						x
Phalaris arundinacea	reed canarygrass		x				
Achnatherum sp.	needlegrass					x	
Polygonum sp.	knotweed		x				
Rumex acetosella	sheep sorrel			x	x		
Rumex occidentalis	western dock						x
Rumex stenophyllus	narrow-leaved dock						x
Athyrium felix-femina	lady fern		x				
Polystichum munitum	western swordfern	x		x	x	x	
Pteridium aquilinum	bracken fern	x			x	x	
Claytonia sibirica	Siberian miners'-lettuce	x					
Batis maritima	saltwort/turtleweed						x
Trientalis borealis	northern starflower	x			x		
Ceanothus velutinus var. veluntinus	tobacco bush				x		
Amelanchier alnifolia	western serviceberry	x		x		x	
Crataegus douglasii	black hawthorn		x		x		
Fragaria vesca	woodland strawberry			x			
Geum macrophyllum	large-leaf avens					x	
Rosa gymnocarpa	naked-hip rose/dwarf rose	x			x		
Holodiscus discolor	oceanspray	x			x	x	
Malus fusca	Oregon crab apple	x	x		x		
Oemleria cerasiformis	Indian plum	x					
Comarum palustre	marsh cinquefoil/purple marshlocks		x				x
Prunus emarginata	bitter cherry	x		x			

Appendix B
Plants Identified In and Around the Proposed Action

Species	Common Name	Coniferous Forest	Kettle Wetland and Buffer	Disturbed Areas	Bluff	Open/ Grassland	Brackish Marsh
Rosa nutkana	Nootka rose	x					
Rubus ulmifolius	Himalayan blackberry/elmleaf blackberry			x	x		
Rubus laciniatus	cut-leaf blackberry			x	x		
Rubus occidentalis	black raspberry			x	x		
Rubus parviflorus	thimbleberry				x		
Rubus spectabilis	salmonberry	x					
Rubus ursinus	Pacific blackberry/California blackberry	x		x	x	x	
Spiraea douglasii	hardhack/rose spirea	x		x			
Galium sp.	bedstraw	x					
Populus trichocarpa	black cottonwood	x		x			
Salix scouleriana	Scouler willow	x	x	x	x		
Salix sp.	willow			x			
Heuchera sanguinea	small-flower coral bells				x		
Digitalis purpurea	purple foxglove			x			
Solanum dulcamara	climbing nightshade		x				
Sparganium emersum	European bur-reed		x				
Taxus brevifolia	Pacific yew	x			x		
Typha latifolia	cat-tail			x			
Urtica dioca	stinging nettle	x					
Viola palmata	early blue violet					x	

Appendix B
Animals Identified In and Around the Proposed Action

Species	Common Name	Coniferous Forest	Oak-Grassland	Disturbed Areas	Palustrine Wetland	Brackish Marsh
Reptiles and Amphibians						
Taricha granulosa	Northern rough-skinned newt				x	
Plethodon cinereus	Western red-backed salamander	x			x	
Rana aurora	Northern red-legged frog	x			x	
Rana catesbeiana	Bullfrog				x	
Bufo boreas	Western toad				x	
Hyla regilla	Pacific tree frog	x			x	
Sceloporus occidentalis	Western fence lizard		x			
Gerrhonotus coeruleus	Northern alligator lizard		x			
Charina bottae	Rubber boa				x	x
Thamnophis sirtalis pickeringi	Puget Sound red-sided garter snake	x	x	x	x	x
Birds						
Loons and Grebes						
Gavia immer	Common loon					x
Aechmorphorus occidentalis	Western grebe					x
Podiceps gisegena	Red-necked grebe					x
Podiceps auritus	Horned grebe					x
Podilymbus podiceps	Pied-billed grebe					x
Waterfowl						
Anas platyrhynchos	Mallard				x	x
Anas acuta	Pintail				x	x
Anas strepera	Gadwall				x	x
Mareca american	American widgeon				x	x
Spatula clypeata	Northern shovelor				x	x
Anas discors	Blue-winged teal				x	x
Anas carolinensis	Green-winged teal				x	x
Aix sponsa	Wood duck				x	x
Aytha valisineria	Canvasback				x	x
Aytha collaris	Ring-necked duck				x	x
Aytha marila	Greater scaup				x	x
Aytha affinis	Lesser scaup				x	x
Bucephala clangula	Common goldeneye				x	x
Bucephala albeola	Bufflehead				x	x
Oxyura jamaicensis	Ruddy duck				x	x
Mergus serrator	Red-breasted merganser				x	x
Oidemia nigra	Common scoter				x	x
Melanitta deglandi	White-winged scoter				x	x
Melanitta perspicillata	Surf scoter				x	x
Raptors						
Cathartes aura	Turkey vulture	x	x	x		
Accipiter cooperii	Cooper's hawk		x			
Accipiter striatus	Sharp-shinned hawk	x	x	x		
Buteo jamaicensis	Red-tailed hawk *	x	x	x		
Haliaeetus leucocephalus	Bald eagle	x				x
Pandion haliaetus	Osprey	x			x	x
Falco sparverius	American kestrel		x	x		
Bubo virginianus	Great horned owl	x	x			
Asio flammeus	Short-eared owl				x	x
Tyto alba	Barn owl		x	x		
Upland Game Birds						
Dendragapus obscurus	Blue grouse	x				
Bonasa umbellus	Ruffed grouse *	x	x			
Lophortyx californicus	California quail	x	x			
Phasianus colchicus	Ring-necked pheasant		x	x		

Appendix B
Animals Identified In and Around the Proposed Action

Species	Common Name	Coniferous Forest	Oak-Grassland	Disturbed Areas	Palustrine Wetland	Brackish Marsh
Herons						
Ardea herodias	Great blue heron				x	x
Butorides virescens	Green heron				x	x
Rails and Coots						
Rallus limicola	Virginia rail				x	x
Fulica americana	American coot				x	x
Doves and Pigeons						
Columba fasciata	Band-tailed pigeon	x	x	x		
Zenaidora macroura	Mourning dove		x	x		
Shorebirds						
Charadrius vociferus	Killdeer			x		x
Capella gallinago	Common snipe				x	x
Uria aalge	Common mure					x
Cepphus columba	Pigeon guillemot					x
Cerorhinca monocerata	Rhinoceros auklet					x
Kingfishers						
Megaceryle alcyon	Belted kingfisher				x	
Hummingbirds						
Selasphorous rufus	Rufus hummingbird	x	x	x	x	
Woodpeckers						
Colaptes auratus	Common flicker *	x	x			
Dryocopus pileatus	Pileated woodpecker *	x				
Sphyrapicus varius	Red-breasted sapsucker *	x				
Dendrocopos villosus	Hairy woodpecker *	x				
Dendrocopos pubescens	Downy woodpecker	x				
Songbirds						
Empidonax trallii	Willow flycatcher		x	x		
Empidonax difficilis	Western flycatcher	x	x			
Contopus sordidula	Western wood pewee	x	x			
Nuitallornis borealis	Olive-sided flycatcher	x				
Hirundo rustica	Barn swallow				x	x
Petrochelidon pyrrhonota	Cliff swallow[1]					
Iridoprocne bicolor	Tree swallow				x	x
Cyancitta stelleri	Stellar's jay	x	x			
Corvus brachyrhynchos	Common crow *	x	x	x	x	x
Parus atricapillus	Black-capped chickadee	x				
Parus rufescens	Chestnut-backed chickadee *	x				
Psaltriparus minimus	Common bushtit		x	x		
Sitta canadensis	Red-breasted nuthatch *	x				
Certhia familiaris	Brown creeper	x				
Troglodytes troglodytes	Winter wren *	x	x			
Thryomanes bewickii	Bewick's wren				x	x
Telmatodytes palustris	Marsh wren				x	x
Turdus migratorius	American robin		x			
Ixoreus naveius	Varied thrush *	x	x			
Hylocichla ustulata	Swainson's thrush	x	x			
Regulus satrapa	Golden-crowned kinglet *	x				
Regulus calendula	Ruby-crowned kinglet	x				
Anthus spinoletta	Water pipit				x	x
Bombycilla cedrorum	Cedar waxwing		x			
Lanius excubitor	Northern shrike		x			
Sturnus vulgaris	European starling	x	x			
Vireo gilvus	Warbling vireo		x			
Dendroica petechia	Yellow warbler				x	
Dendroica coronata	Yellow-rumped warbler	x				
Geothlypis trichas	Common yellowthroat				x	
Oporornis tolmiei	MacGillivray's warbler		x	x		
Wilsonia pusilla	Wilson's warbler		x	x		
Sturnella neglecta	Western meadowlark		x	x		
Agelaius phoeiceus	Red-winged blackbird				x	
Molothrus ater	Brown-headed cowbird	x	x	x	x	

Appendix B
Animals Identified In and Around the Proposed Action

Species	Common Name	Coniferous Forest	Oak-Grassland	Disturbed Areas	Palustrine Wetland	Brackish Marsh
Piranga ludoviciana	Western tanager		x			
Hesperiphona vespertina	Evening grosbeak	x				
Carpodacus purpureus	Purple finch	x				
Carpodacus mexicanus	House finch	x				
Spinos pinus	Pine siskin	x				
Spinus tristis	American goldfinch		x	x		
Pipilo erthrophtalmus	Rufus-sided towhee	x	x	x		
Passersulus sandwichensis	Savannah sparrow		x	x		x
Pooecetes gramineus	Vesper sparrow		x	x		
Junco hyemalis	Dark-eyed junco		x	x		
Spizella passerina	Chipping sparrow		x	x		
Zonotrichia leucophrys	White-crowned sparrow		x	x		
Passerella iliace	Fox sparrow		x	x		
Melospiza melodia	Song sparrow		x	x		
Mammals						
Large and Medium Size						
Procyon lotor	Raccoon		x	x	x	x
Mustela frenata	Long-tailed weasel	x	x	x	x	x
Mephitis mephitis	Striped skunk	x	x	x	x	x
Canis latrans	Coyote *	x	x	x	x	x
Sciurus griseus	Western gray squirrel		x			
Tamiasciurus douglasi	Douglas squirrel *	x				
Erethizon dorsatum	Porcupine	x	x	x	x	x
Lepus americanus	Snowshoe hare		x	x	x	x
Sylvilagus floridanus	Eastern cottontail		x	x	x	x
Odocoileus hemionus	Black-tailed deer	x	x	x	x	x
Furbearers						
Mustela vison	Mink				x	x
Castor canadensis	Beaver				x	
Ondatra zibethica	Muskrat				x	
Small Mammals						
Sorex cinerus	Masked shrew	x	x		x	x
Sorex trowbridge	Trowbridge shrew	x	x			
Sorex vagrans	Vagrant shrew				x	x
Sorex obscurus	Dusky shrew	x	x	x	x	x
Sorex bendirei	Pacific water shrew				x	
Neurotrichus gibbsi	Shrew mole				x	x
Scapanus townsendi	Townsend mole	x			x	x
Scapanus orarius	Pacific mole		x			
Eutamias townsendi	Townsend chipmunk	x				
Peromyscus maniculatus	Deer mouse	x	x			
Microtus townsendi	Townsend vole		x		x	x
Microtus oregoni	Oregon vole	x	x	x

MRO	Mineral Resource Overlay
Project	South Parcel Expansion Project

1 Introduction

CalPortland operates the Pioneer Aggregates Mine facility in DuPont, Washington (Figure 1). CalPortland is proposing an expansion of the mine to the south, known as the South Parcel Project (Project), within the City of DuPont's (City's) designated Mineral Resource Overlay (MRO) District.

The South Parcel Project includes mining within areas previously undisturbed by mining (termed the "Expansion Area") and mining deeper within a portion of the existing mine, referred to as the "Re-Mine Area." The Expansion Area is approximately 188 acres and is composed of three subareas (see Figure 2). The Kettle Area is a 10.8-acre previously undisturbed area. The 9.2-acre Buffer Strip is a strip of vegetation that was retained along the inside of the originally permitted mine bordering the South Parcel. The South Parcel is 168 acres located southeast of the original mine and inside the Mineral Resource Overlay area in the City of DuPont's adopted Comprehensive Plan. Approximately 126 acres within the 168-acre South Parcel are forested.

All areas to be cleared and mined are within the City's Comprehensive Plan MRO area. The purpose of an MRO designation is to implement the Growth Management Act, the Surface Mining Act, and the DuPont Comprehensive Plan by designating commercially viable mineral resources where they occur and allowing for extraction of resources from those areas (DMC 25.60.010).

This report is prepared to inform decisions made regarding tree retention requirements under DMC 25.120, to the extent DMC 25.120.030 is applicable to land and trees within the City's designated mineral Resource Overlay area.

Typical development projects are required to retain a certain number of trees within the tax parcel being developed. The proposed South Parcel Project includes activity on multiple tax parcels. For this report, landmark trees were inventoried within a study area that included all the tax parcels where work is proposed. For this reason landmark trees are counted that would be removed from the proposed Re-Mine Area and landmark trees in the buffer area adjacent to the Re-Mine Area are counted as retained. Similarly, landmark trees that would be removed from the proposed Expansion Area and landmark trees that would be retained within the buffer adjacent to the Expansion Area are inventoried.

Landmark trees in the Re-mine area and the expansion area are counted separately in this report because City permits for the existing mine authorize removal of trees from the Re-mine area and not the expansion area.

2 Tree Survey Methods

The City of DuPont Municipal Code (DMC) defines a "landmark tree" as "an existing healthy, well-formed tree which poses no safety hazard due to potential collapse," and that is of the following species, trunk type, and minimum diameter measured at breast height (dbh) (Table 1). See DMC 25.10.120.005.

Table 1
Landmark Tree Criteria

Trunk Type	Species	
	Oregon White Oak, Pacific Yew, or Madrone (dbh, inches)	**Douglas Fir, Western Red Cedar, Western Hemlock, or Bigleaf Maple (dbh, inches)**
Single Trunk	24	30
Multi-Trunk (sum of diameters)	30	45

A landmark tree inventory was conducted by a two-person team over 6 days in October 2019 and 1 day in September 2020. The team was led by Anchor QEA Biologist and Certified Arborist Joseph Pursley (International Society of Arboriculture PN-7486A). Trees meeting the species and stem size criteria for landmark trees (Table 1) were evaluated visually to determine if they met the health and form standard defined for landmark trees in the DMC.

Trees that did not exhibit apparent evidence of insect damage, woodpecker damage, rot, dwarf-mistletoe, or other similar tree ailments were considered healthy. Well-formed trees do not have broken leaders, significant wind damage, or exhibit irregular growth, including conifers with multiple stems.

All healthy and well-formed trees meeting the size criteria were marked with high-visibility spray paint, and a numbered aluminum tag was placed on the north side of the tree stem. For multi-trunk and multi-stemmed landmark trees, only one numbered tag was used. The location of each tagged and numbered tree was recorded using a Trimble differential global positioning system. Information collected at each tagged and numbered tree included the dbh of each stem, tag number, and species.

Available maps of Oak Management Units in the city and aerial photographs were also reviewed. Aerial photographs reveal that much of the Study Area was thinned and that many of the larger trees were removed between 1990 and 2002. Oak Management Unit (OMU) No. 14 lies within the Study Area, and one Oregon white oak that meets the City's Landmark tree criteria was found within OMU-14.

3 Health of Trees Observed

Poorly formed and unhealthy trees, including trees with damaged stems, broken leaders, insect damage, woodpecker damage, evidence of rot, dwarf-mistletoe, and other tree ailments, are prevalent in the study area. Most of the trees within the Study Area that met the landmark size criteria could not be deemed landmark trees because they are unhealthy, damaged, or otherwise poorly formed.

Historical aerial photographs suggest this is a naturally recruited, fairly even-aged stand established on previously logged property. The most common causes of poor health observed were insect damage, including bark beetle, and brown cubical rot. Most of the poorly formed trees appeared to have significant wind damage, resulting in loss of significant branches and lost leaders of conifers. Crowding under the closed canopy has also resulted in many specimens that are oddly formed in response to competition for sunlight.

4 Landmark Tree Inventory Results

The Study Area inventoried for landmark trees included the complete tax parcels that will be affected by mining of the Expansion Area and the Re-Mine Area. As summarized in Tables 2A and 2B and depicted in Figure 2, 141 trees within the Study Area met the landmark tree criteria of size, species, health, and form (Appendix B).

Table 2A
Summary of Landmark Trees Within the Expansion Area Tax Parcels

Common Name	Scientific Name	Total Trees	Trees in Expansion Area	Trees in Adjacent Buffer
Bigleaf maple	*Acer macrophyllum*	2	**-**	2
Douglas fir	*Pseudotsuga menziesii*	81	**73**	8
Pacific madrone	*Arbutus menziesii*	1	**1**	-
Pacific yew	*Taxus brevifolia*	1	**1**	-

Oregon white oak	*Quercus garryana*	13	**13**	-
Total		**108**	**89**	**19**

Table 2B
Summary of Landmark Trees Within the Re-Mine Area Tax Parcels

Common Name	Scientific Name	Total Trees	Trees in Re-Mine Area	Trees in Adjacent Buffer
Bigleaf maple	*Acer macrophyllum*	-	-	-
Douglas fir	*Pseudotsuga menziesii*	15	1	14
Pacific madrone	*Arbutus menziesii*	1	-	1
Pacific yew	*Taxus brevifolia*	2	-	2
Western red cedar	*Thuja plicata*	8	1	7
Total non-Oak		**26**	**-**	**-**
Oregon white oak	*Quercus garryana*	7	2	5
Total		**33**	**4**	**29**

5 Landmark Tree Impacts

This evaluation of landmark tree impacts focuses on the landmark trees removed from the Expansion Area parcels because tree removal within the Re-Mine Area is authorized under existing permits. Table 3 lists the total number of landmark trees within the Expansion Area tax parcels that will be retained and the number that will be removed, by species.

Table 3
Summary of Impacts to Landmark Trees within Expansion Area Parcels

	Oregon white oak (*Quercus garryana*)	**Big Leaf Maple (*Acer macrophyllum)***	**Douglas fir (*Pseudotsuga menziesii*)**	**Pacific madrone (*Arbutus menziesii*)**	**Pacific yew (*Taxus brevifolia*)**	**Western red cedar (*Thuja plicata*)**	**Total Trees**
Trees Removed (under this request)	13	0	73	1	1	1	89
Trees Retained	0	2	8	0	0	9	19
Total Landmark Trees	**13**	**2**	**81**	**1**	**1**	**10**	108

Note: No western hemlock (*Tsuga heterophylla*) that meet landmark tree criteria are present on the Expansion Area parcels.

6 Landmark Tree Replacement Plan

The Surface Mine Reclamation Act (RCW 78.44) gives the Washington Department of Natural Resource (DNR) exclusive regulatory authority over surface mine reclamation in the state and requires miners to leave property in a condition suitable for its subsequent use following the completion of mining. The reclamation requirements are intended to address landscape concerns on the scope and scale appropriate for mining operations and are consistent with the purpose or intent of the City's landmark tree ordinance.

CalPortland successfully plants trees on the slopes of the existing mine as part of their ongoing mine reclamation program and in compliance with the Surface Mine Reclamation Act (RCW 78.44). Tree planting success (survival) is one component of the reclamation plan that is reviewed, approved, and inspected for compliance by the DNR. Implementation of the reclamation plan is assured by a financial guarantee provided to the DNR by the CalPortland in the form of a bond.

This practice will continue in the South Parcel and as mining progresses in other areas of the mine consistent with an updated mine reclamation plan reviewed, approved, and inspected by the DNR and required by the Surface Mine Reclamation Act (RCW 78.44).

Soil for future tree planting begins prior to mining when the site is cleared of stumps and debris, slash is ground to chips for later use as a soil amendment, and topsoil is mixed with wood chips and clean clay and silt washed from processed gravel (belt press fines) and stockpiled for later use in reclamation.

As extraction in each mine segment is completed, slopes are cut to final contours. In the South Parcel, slopes (approximately 3 feet horizontal to 1 foot vertical) will border the eastern and southwestern portions of the mine floor and join the existing mine area to the north.

The amended topsoil is then spread across the contoured slopes and cross tracked with a dozer to prevent erosion.

After topsoil placement, holes are dug in the slopes where trees are planted. Tree planting is proposed where new reclaimed slopes planted with trees and suitable to be designated as open space will remain after mining. Once final reclamation is complete, Sequalitchew Village will have approximately 180 acres of these slopes planted with a variety of trees including Douglas fir, red alder (*Alnus rubra*), and Oregon white oak, ranging in age from seedlings to nearly 40 years old.

Tree seedlings are generally planted during the fall and spring. Douglas fir, white oak, and other species are typically planted at an approximate spacing of 10- by 10-foot, establishing a stocking level of approximately 430 trees per acre on the reclaimed slopes. These plantings are

complemented by naturally recruited red alder, bigleaf maple, and Pacific madrone occurring in the buffers adjacent to the mined slopes.

CalPortland proposes removing 89 landmark trees in the Expansion Area. A typical tree mitigation plan might require a developer to replace removed Landmark trees at a ratio of 50:1 (Table 4). At a stocking ratio of 430 trees per acre, such a plan would require CalPortland to plant trees on only 10.9 acres to achieve a 50:1 replacement ratio for 89 trees. CalPortland expects to plant approximately 180 acres total on the slopes of the mine.

A typical mitigation plan might require a developer to plant trees for mitigation in a single season and monitor their success for 3 to 5 years. CalPortland will have planted a variety of trees on the reclaimed slopes of Sequalitchew Village over a period of at least three decades and will monitor and ensure their success with a reclamation bond held by DNR during that time.

In 2020 CalPortland began testing plantings of Oregon white oak and will continue to include Oregon white oak in the mix of trees planted in the future to ensure that at least 650 (50X13) white oaks are planted.

As the reclaimed areas mature, a native understory of herbaceous and woody species will also propagate from seed and rhizomes naturally occurring in the redistributed topsoil. Reclaimed slopes along the western boundary of the site are designed in a sinuous fashion to mimic and blend with the native topography that parallels Puget Sound.

Deleterious vegetation such as blackberry and Scotch broom will be removed mechanically, to allow tree establishment and release from shading and competition for nutrients and moisture.

Table 4
Tree Replacement Summary for All Trees

Type	Quantity to Be Removed	Mitigation Ratio	Approximate Number of Trees to Be Planted[1]
Landmark Trees	89	50:1	4,450

Note:

1. The total number of trees to be planted is limited by the areas suitable for planting prior to development of Sequalitchew Village, in accordance with the City of DuPont Comprehensive Plan.

Table 5 summarizes the proposed replacement tree planting. Tree seedlings will be planted during the dormant season. Douglas fir, white oak, and other species will be planted at 10- by 10-foot spacings, establishing a stocking level of approximately 430 trees per acre on the reclaimed slopes. These plantings are expected to be complemented by naturally recruited red alder, bigleaf maple, and Pacific madrone. Based on the success of the reforested slopes in the existing mine, Douglas fir

(1+1 seedling stock) and red alder (plug 1 or yearling pull-ups) are recommended. In 2020 CalPortland began testing plantings of Oregon white oak. If initial plantings are successful, then theses species will be added to the mix of trees planted. Based on existing reclamation at the site, volunteer seedlings are expected to propagate on the topsoiled slopes, in addition to the planting described above. The mature forests that buffer the western mine boundary provide an excellent seed source of other native deciduous and conifer species including Pacific madrone, bigleaf maple, western hemlock, and western red cedar.

Table 5
Revegetation Planting Plan

Common Name	Scientific Name	On Center Spacing (feet)	Planting Season
Douglas fir	*Pseudotsuga menziesii*	10	October 15 – March 15
Oregon white oak	*Quercus garryana*	10	October 15 – March 15
Red Alder	*Alnus rubra*	10	October 15 – March 15

Weyerhaeuser Pathologist Report

Location • Weyerhaeuser Research
505 N Pearl St
Centralia, WA 98531

8/16/2019

Subject: Weyerhaeuser Dupont Mine Site “Landmark Trees” Recognizance

Author: John Browning (Weyerhaeuser Forest Pathologist)

Weyerhaeuser has a forested area adjacent to the Dupont CalPortland gravel mine. We are interested in removing these trees so the area can be mined for gravel. Most of the trees on this land are Douglas-fir. The city of Dupont has a “Landmark tree” statute as shown in Table 1. On 8/26/2019, Mary Castle (Weyerhaeuser Manager of Western Minerals) and myself walked this land to examine these trees and see if we thought they would qualify as “Landmark trees.”

Table 1. Dupont Landmark tree statute.

25.10.120.005 Landmark tree.

“Landmark tree” means an existing healthy, well formed tree which poses no safety hazard due to potential collapse and that is of the following species, trunk type, and minimum diameter measured at breast height:

	Species	
Trunk type	Oregon white oak, Pacific yew, or madrona	Douglas fir, western red cedar, western hemlock, or big leaf maple
Single trunk	24 inches	30 inches
Multi-trunk (sum of diameters)	30 inches	45 inches

(Ord. 18-1045 § 2 (Exh. A))

Stand Composition:

This stand is primarily Douglas-fir mixed with some Oregon white oak. We also found a small amount of big leaf maple. The majority of the Douglas-fir is probably smaller than the 30" DBH requirement for Landmark Trees but there are still many big trees larger than 30". These are mostly open grown Douglas-fir with very large branches down to the ground. Photos 1-3 show examples of these "Woofy" Douglas-fir.

Damage and Hazards:

Mary and I thought most of the large Douglas-fir would be rejected from the Landmark Tree status due to form and possibly safety concerns. Most of these trees have major damage approximately 30 to 40 feet up the truck were the top had died or been broken out and side branches had taken over. Jim Tweedy (mine manager for Glacier NW) stated that this damage was likely due to a major ice storm back in the 50s. Many of these trees also have forked tops. In addition, quite of few of these trees also have considerable sweep at the base. Photos 4 through 12 show examples of the form issues with these Douglas-fir.

From a hazard tree standpoint there is always concern in large Douglas-fir when the top dies and laterals take over because this will develop a weak area and likely entry point for decay.

We looked for root disease and decay and found some evidence of brown cubical rot (possibly *Schweinitzii* although we did not find any fruiting bodies) decaying smaller Douglas-fir to the point that they were falling over (Photos 13 to 16). While I suspect that there is major decay is some of the larger Douglas-fir I did not find any that had fallen over. There are some with evidence of wounds near the base which could be entry points for decay (Photos 17 to 19). Weyerhaeuser Research does have a Resistograph drill which could be used to test these trees for decay without majorly damaging the trees.

There were Douglas-fir with evidence of woodpecker activity which usually indicates insect infestation (Photo 20). Photos 21 to 23 show large hole evidence of boring activity near the base of the trees. Some trees had lots of sap flow which probably indicates a bark beetle infestation (Photo 24).

Hardwoods.

Most of the hardwoods on this site were Oregon white oaks. We did not find any of these trees large enough to meet the Landmark tree definition of 24" (30" for multiple trunks). We did examine one large bigleaf maple which had lots of decay within 6' of the base (Photo 25).

Trees with good form.

We did find a few Douglas-fir large enough to be classified as "Landmark trees" with good form. Overall, we saw maybe six trees that would meet the "Landmark tree" definition as we interpreted it.

General Form Photos:

Photo 1. Open grown Douglas-fir with large branches down to the ground.

Photos 2 & 3. Open grown Douglas-fir with large branches.

Floodplain Habitat Assessment and Mitigation Report

November 2020
DuPont Aggregates South Parcel Project

Floodplain Habitat Assessment and Mitigation Report

Prepared for
CalPortland
P.O. Box 1730
Seattle, Washington 98111

Prepared by
Anchor QEA, LLC
1201 3rd Avenue, Suite 2600
Seattle, Washington 98101

1 Introduction

Glacier Northwest, Inc., dba CalPortland, is seeking regulatory approvals for the Pioneer Aggregates South Parcel Project (Project), which proposes to extend sand and gravel mine operations to the southeast of existing activities at the Pioneer Aggregates Mine in DuPont, Washington. This Floodplain Habitat and Mitigation Report (Report) has been prepared per Federal Emergency Management Agency (FEMA) guidelines as defined in the FEMA guidance document *Regional Guidance for Floodplain Habitat and Assessment and Mitigation in the Puget Sound Basin* (FEMA 2013).

There is one waterbody in the Project Area, the 1.78-acre Kettle Wetland. Fish and wildlife habitat conservation areas located within the Project Area include the Kettle Wetland, the associated wetland bu

ffer, and upland vegetation communities. The following Project documents have been prepared describing the Kettle Wetland and vegetation communities and wildlife habitat conditions within the Project Area:

- *North Sequalitchew Creek Project Impact Area Wetland Delineation Report* (Anchor Environmental 2007)
- *Addendum to 2007 North Sequalitchew Creek Project Impact Area Wetland Delineation Report* (Anchor QEA 2018)
- *South Parcel Expansion Project Critical Areas Report* (Anchor QEA 2020a)

These other reports provide supporting information such as the Project description, Kettle Wetland delineation and rating, vegetation and wildlife habitat description, topography, soils, geologic conditions, Project impacts, proposed mitigation measures, and associated figures, all of which are included by reference in this Report. Per FEMA guidance, the term Project Area is used in this Report (FEMA 2013). In the *South Parcel Expansion Project Critical Areas Report and Habitat Management Plan* (Anchor QEA 2020a), the term Expansion Area is used to describe the Project Area.

2 Project Area

The proposed Project is located on privately owned property at 4301 Pioneer Avenue in the City of DuPont, Pierce County, Washington (Figure 1). The proposed Project covers portions of Sections 22, 23, 26, and 27 of Township 19 North, Range 1 East at 47.118213 N latitude / -122.661295 W longitude.

The Project will be located on the following privately owned tax parcels: 0119233011, 0119233014, 0119233015, 0119233016, 0119233017, 0119262015, 0119262016, 0119232011, 0119232012, and 0119224005. The Project is located in the Chambers-Clover Watershed, Water Resource Inventory Area (WRIA) 12 (Ecology 2020).

The Project Area is zoned as Mineral Resources overlay (City of DuPont 2015). Project Area features including parcel boundaries, the analysis area, the Kettle Wetland, topography, soils, geology, and aerial photographs displaying vegetation communities are shown in the figures in the *South Parcel Expansion Project Critical Areas Report and Habitat Management Plan* (Anchor QEA 2020a) and *North Sequalitchew Creek Project Impact Area Wetland Delineation Report* (Anchor Environmental 2007).

2.1 Fish and Wildlife Habitat

There is one waterbody in the Project Area, the Kettle Wetland. The Kettle Wetland is a 1.78-acre wetland located southwest of the existing processing plant. This wetland is classified as a Class II wetland by City of DuPont regulations and a Category III wetland using the Washington State Department of Ecology (Ecology) wetland rating system. Water levels within the wetland are determined by the seasonal fluctuation in the elevation of the Vashon aquifer, which is the dominant source of hydrology for the wetland. The Kettle Wetland is more than 1/2 mile from a water of the United States and sits in a closed depression, with no surface water connection to the larger watershed, substantially limiting the wetland's opportunity to provide hydrologic or water quality functions. The Kettle wetland is within a FEMA mapped Special Flood Hazard Area without base flood elevation (Zone A). A second FEMA mapped Special Flood Hazard Area (also Zone A) is approximately 0.3 miles southwest of the Kettle Wetland (Figure 2). This second feature is on dry, excessively drained soils (Soil Survey Staff 2020). The second feature has been previously disturbed and cleared of woody vegetation. It provides poor habitat conditions for the species described in this document. Neither of the two Flood Hazard Areas have any surface water connections, the only hydrologic connections are precipitation and in the case of the Kettle wetland, groundwater.

The original Kettle Wetland delineation was conducted in 2007 by Anchor Environmental staff. The Kettle Wetland was redelineated in December 2017 due to the length of time that transpired since the original delineation occurred. During this later delineation, the Kettle Wetland was rated under Ecology's *Washington State Wetland Rating System – Western Washington: 2014 Update* (Hruby 2014)

and the 2018 DuPont Municipal Code Sensitive Areas Regulations (City of DuPont 2018). On April 17, 2019, the U.S. Army Corps of Engineers issued a determination that the Kettle Wetland is not a water of the United States (USACE 2018).

A complete description of the Kettle Wetland and associated wetland buffer vegetation, soil, and hydrologic characteristics, wetland functions, wetland delineation data forms, and the Ecology and City of DuPont wetland rating forms are included in the *North Sequalitchew Creek Project Impact Area Wetland Delineation Report* (Anchor Environmental 2007) and *Addendum to 2007 North Sequalitchew Creek Project Impact Area Wetland Delineation Report* (Anchor QEA 2018).

The Kettle Wetland is identified on Washington Department of Fish and Wildlife (WDFW) Priority Habitats and Species (PHS) Maps (WDFW 2020a) and U.S. Fish and Wildlife Service (USFWS) National Wetlands Inventory (NWI) Map Information (USFWS 2020a). The southwest portion of the Project Area is also mapped by WDFW PHS as a biodiversity area. The WDFW PHS identifies the Project Area as containing big brown bat (*Eptesicus fuscus*), little brown bat (*Myotis lucifugus*), and Yuma myotis bat *Myotis yumanensis*), which may breed in the area. No state or federally listed species are documented by WDFW within the Project Area (WDFW 2020a). Federally listed species are discussed in Section 2.1.1.

These reference maps should be included as figures.

2.1.1 Endangered Species Act-Listed Species and Critical Habitats

Endangered Species Act (ESA)-listed species and critical habitats under National Marine Fisheries Service (NMFS) and U.S. Fish and Wildlife Service (USFWS) jurisdiction in western Washington are referenced on the agencies' websites. The NMFS identifies ESA-listed species that occur or may occur within a broad geographic area, such as an evolutionarily significant unit (ESU) or a distinct population segment (DPS), rather than a project-specific location (NMFS 2020). The USFWS identifies ESA-listed species that occur or may occur within a specific location where a project is proposed (USFWS 2020b).

included the NMFS and USFWS species lists as appendices.

The October 2020 status and potential presence of federally listed species and critical habitats protected under the ESA that may occur within the Project Area are presented in Table 1. As shown in Table 1, 11 ESA-listed species are identified by NMFS and USFWS as having the potential to occur within the Project Area. Of these species, three are aquatic (fish); five are terrestrial (one amphibian, three birds, and one mammal), and three are plants. Designated critical habitat for several of these species is present within Pierce County; however, no designated critical habitat is present within the Project Area.

Table 1
Occurrence of Listed Species and Critical Habitat in or Near the Project Area

Common Name	Scientific Name	ESA Status	Jurisdiction	Species Present in Project Area	Critical Habitat Present in Project Area
Fish					
Puget Sound ESU Chinook Salmon	*Oncorhynchus tshawytscha*	Threatened	NMFS	No	No
Puget Sound DPS Steelhead	*Oncorhynchus mykiss*	Threatened	NMFS	No	No
Coastal-Puget Sound DPS Bull Trout	*Salvelinus confluentus*	Threatened	USFWS	No	No
Amphibians					
Oregon Spotted Frog	*Rana pretiosa*	Threatened	USFWS	No	No
Birds					
Marbled Murrelet	*Brachyramphus marmoratus*	Threatened	USFWS	No	No
Streaked Horned Lark	*Eremophila alpestris strigata*	Threatened	USFWS	No	No
Yellow-billed Cuckoo	*Coccyzus americanus*	Threatened	USFWS	No	No
Mammals					
Gray Wolf	*Canis lupus*	Proposed Endangered	USFWS	No	No
Plants					
Golden Paintbrush	*Castilleja levisecta*	Threatened	USFWS	No	No
Marsh Sandwort	*Arenaria paludicola*	Endangered	USFWS	No	No
Water Howellia	*Howellia aquatallis*	Threatened	USFWS	No	No

There are no federally listed species, designated critical habitats, or essential fish habitats in the Project Area. The ESA-listed or proposed terrestrial and plant species identified by the USFWS as potentially occurring in the Project Area do not occur in the vicinity of the Project Area based on the species' life history and habitat requirements. The Kettle Wetland does not provide wetland habitat features associated with Oregon spotted frog. Potential habitat for the four ESA-listed bird and mammal species identified in Table 1 (gray wolf, marbled murrelet, streaked horned lark, and yellow-billed cuckoo) is not located within many miles of the Project Area due to urban development. Additionally, these species are not typically associated with areas of human activity except in rare,

What about listed salmonid fish in the Sequalitchew Cr. system and marine shoreline, whose habitat may be affected by the Project and related restoration plan?

usually temporary, circumstances. Habitat features associated with the three plant species (golden paintbrush, marsh sandwort, and water howellia) are not present within the Project Area or vicinity.

3 Project Description, Environmental Effects, and Mitigation Measures

3.1 Project Description

The Project description is presented in the *South Parcel Expansion Project Critical Areas Report and Habitat Management Plan* (Anchor QEA 2020a).

3.2 Environmental Effects and Mitigation Measures

The following subsections provide a summary of environmental effects under the proposed Project. A complete description of potential Project impacts and Project mitigation measures is presented in the *South Parcel Expansion Project Critical Areas Report* (Anchor QEA 2020a).

3.2.1 Wetlands

Under the proposed Project, permanent impacts to the Kettle Wetland and its buffer would occur as a result of earthwork mining activities: the entire wetland would be excavated. The area of wetland disturbance is 1.78 acres, and the total buffer area of disturbance is 3.4 acres. All functions and values of the wetland will be mitigated for by constructing a larger wetland as described in the *South Parcel Expansion Project Wetland Mitigation Plan* (Anchor QEA 2020b).

3.2.2 ESA-Listed Species and Critical Habitats

Overall, the Project will not result in measurable potential impacts on ESA-listed species or critical habitats. There is no designated critical habitat located within the Project Area. Potentially suitable habitat for ESA-listed species identified by NMFS and USFWS as having the potential to occur within or near the Project Area is not present within the Project Area. Based on the proposed Project elements, if an ESA biological evaluation was performed for this Project, the effect determination for ESA-listed species and associated critical habitats would likely be no effect.

See comments on page 4.

1. INTRODUCTION

The Pioneer Aggregates South Parcel Project ("South Parcel Project") includes horizontal expansion of mining into approximately 188 acres previously undisturbed by mining and vertical expansion of approximately 125 acres where mining will deepen a portion of the existing mine. The South Parcel Project would extend mining at the current rate for approximately 14 additional years.

Mining under the South Parcel Project will proceed slowly from the north to the south over a period of five to eight years. The method of mining will be identical to that currently used in the permitted mine area. A dozer would push excavated material from the top of the mine face to two front-end loaders working on the mine floor. The front-end loaders would scoop-up the sand and gravel and dump it into portable hoppers that feed conveyors leading to the processing area.

A conveyor will start at the north end of the Expansion Area and will be extended south as mining progresses. The conveyor is comprised of a 48-inch-wide rubberized belt that is supported by a series of rollers, called idlers, mounted on steel framed segments that support the conveyor about five feet off the ground.

A 20-foot-high noise berm will be constructed along the southern boundary of the South Parcel behind retained vegetation and will help reduce potential noise associated with mining for adjacent land uses. The berm will be constructed prior to clearing in the adjacent portionof the South Parcel.

This analysis considers potential noise impacts to residences and other sensitive receivers nearest the expansion area. The following report reviews noise terminology, regulatory criteria applicable to the project, and the methods and findings of the analysis

2. NOISE LEVEL TERMINOLOGY AND HUMAN HEARING

Noise is sometimes defined as unwanted sound; the terms noise and sound are used more or less synonymously in this report. The human ear responds to a very wide range of sound intensities. The decibel scale (dB) used to describe sound is a logarithmic rating system which accounts for the large differences in audible sound intensities. This scale accounts for the human perception of a doubling of loudness as an increase of 10 dB. Therefore, a 70-dB sound level will sound about twice as loud as a 60-dB sound level. People generally cannot detect differences of 1 dB; in ideal laboratory stuations, differences of 2 or 3 dB can be detected by people, but such a change probably would not be detectable in an average outdoor environment. A 5-dB change would probably be perceived under normal listening conditions.

When addressing the effects of noise on people, it is useful to consider the frequency response of the human ear. Sound-measuring instruments are therefore often programmed to weight measured sounds based on the way people hear. The frequency-weighting most often used is A-weighting because it approximates the frequency response of human hearing and is highly correlated to the effects of noise on people. Measurements from instruments using this system are reported in "A-weighted decibels" or dBA. All sound levels in this evaluation are reported in A-weighted decibels.

Distance from the source, the frequency of the sound, the absorbency of the intervening ground, obstructions, and duration of the noise-producing event all affect the transmission and perception of noise. The degree of this effect also depends on who is listening and on existing sound levels.

3. AFFECTED ENVIRONMENT

3.1 Regulatory Overview

The project site is located within the City of DuPont in Pierce County. Section 9.09.040 of the DuPont Municipal Code (DMC 9.09.040) specifies noise limits based on the limits set in the Washington Administrative Code (WAC 173-60). DMC 9.09.040 establishes limits on sounds crossing property boundaries based on the Environmental Designation for Noise Abatement (EDNA) of the sound source and the receiving properties. Section 9.09.040(b) of the DuPont City Code identifies Class A EDNAs as residential areas, Class B EDNAs as commercial areas, and Class C EDNAs as industrial areas. The allowable noise level limits are displayed in **Table 1**.

Table 1. DuPont Maximum Permissible Sound Levels (dBA)

EDNA of Source Property	EDNA of Receiving Property		
	Class A Day/Night [a]	Class B	Class C
Class A	55/45	57	60
Class B	57/47	60	65
Class C	60/50	65	70

[a] The limits for noise received in Class A EDNAs are reduced by 10 dBA during nighttime hours (10 PM to 7 AM).
Source: DMC 9.09.040.

The city noise rule allows the limits presented in **Table 1** to be exceeded for certain periods of time: 5 dBA for no more than 15 minutes in any hour, 10 dBA for no more than 5 minutes of any hour, or 15 dBA for no more than 1.5 minutes of any hour. These allowed increases can be described in terms of the percentage of time a certain level is exceeded, using statistical noise descriptors (L_{n}s). For example, L_{25} represents a sound level that is exceeded 25 percent of the time, or 15 minutes in an hour. Similarly, $L_{8.33}$ and $L_{2.5}$ are the sound levels that are exceeded 8.33 and 2.5 percent of the time, or 5 and 1.5 minutes in an hour, respectively. At no time can the allowable sound level be exceeded by more than 15 dBA, represented by the L_{max}.

DMC Section 9.09.040(c) identifies a map that specifically designates the EDNA's for various properties within the City (Appendix A of Ordinance 208). The EDNA boundaries shown in this map identify a small Class A (Residential) EDNA on both sides of Barksdale Avenue in the historic village of DuPont, a small Class B (Commercial) EDNA between the historic village and I-5, and the remainder of the DuPont area as a Class C (Industrial) EDNA. DuPont Ordinance 208 and the associated map in Appendix A were adopted in 1978; they are no longer representative of current zoning and comprehensive land use plan designations. Furthermore, the 1978 map of EDNA designations does not adequately represent the basic uses identified in 9.09.040(b) that define EDNAs. It is, therefore, unclear whether the EDNA designations shown in the 1978 map or the EDNA identifications based on land uses in 9.09.040(b) should apply.

For this noise analysis, land use zones (as identified in Dupont's Zoning Map) were used to determine the appropriate noise limits for the various receiving properties. This approach is consistent with the more modern language and identification of EDNA designations based on actual uses and represents a more accurate reflection of current and expected future conditions. But applying either method for

identifying the appropriate EDNAs, the South Parcel would be considered a Class C EDNA, and the applicable Ln noise limits for a Class C EDNA noise source affecting different types of receiving properties are displayed in **Table 2**.

Table 2. Applicable Ln Noise Limits for Class C EDNA Noise Sources

EDNA of Source Property	Ln Limits			
	L_{25}	$L_{8.3}$	$L_{2.5}$	L_{max}
Class A [a]	60/50	65/55	70/60	75/65
Class B	65	70	75	80
Class C	70	75	80	85

[a] The limits for noise received in Class A EDNAs are reduced by 10 dBA during nighttime hours (10 PM to 7 AM) and are shown for Day/Night.
Source: DMC 9.09.040 (d)

Because noise generated by South Parcel mining would typically be fairly consistent over an hourly period, the allowances for short-term increases in the noise level limits would rarely apply. Therefore, the most stringent/conservative noise limit for the proposed mining (a Class C source) would be an L_{25} of 70 dBA at nearby Class C EDNAs, an L_{25} of 65 dBA at nearby Class B EDNAs, or an L_{25} of 60 dBA between 7 AM and 10 PM and 50 dBA between 10 PM and 7 AM at nearby Class A EDNAs.

DMC 9.09.050 exempts the following sources from the above noise limits:

- Temporary construction noise, except when received in Class A EDNA properties between the hours of 10 PM and 7 AM;
- Sounds created by motor vehicles when regulated by the state noise limit (Chapter 173-62 WAC), adopted by reference in DMC 9.09.040; and
- Sounds created by motor vehicles, licensed or unlicensed, when operated off public highways, except when such sounds are received in Class A EDNAs.

3.2 Existing Sound Levels

Ramboll measured sound levels from October 31 – November 1, 2019 to characterize the existing sound levels in the project vicinity as part of a noise study for an earlier proposal to mine the south parcel. For the measurements, Ramboll used Larson Davis LxT Class 1 sound level meters and measured hourly sound levels for a minimum of 24-hours. The meters were field-calibrated prior to the measurements and had been factory certified within the previous 12 months. The microphones were placed on tripods about 5 feet above the ground.

The sound level measurements were taken at two locations, shown in **Figure 1**. SLM1 was chosen to represent the nearest residences south of the mine on the north side of the Creekside Apartment complex. SLM2 represents the residential community across Center Drive from the South Parcel. At both measurement locations, noise from the existing Pioneer Aggregates facility was not audible and did not substantively contribute to the measured levels. A summary of the sound level measurement results is displayed in **Table 3,** and detailed information regarding the measured levels is included in Attachment A.

Table 3. Range of Existing Measured Hourly Sound Levels (dBA)

Location	Time [a]	L_{eq} [b]	L_{max}	L_2	L_8	L_{25}	L_{90}	L_{dn} [b]
SLM1	Day	39-48	52-72	43-56	42-49	37-47	33-45	47
	Early Morning	42-44	56-58	46-47	45-46	43-45	40-43	
	Night	35-44	48-58	39-47	37-46	35-45	33-43	
SLM2	Day	49-54	61-83	55-61	53-57	50-56	41-51	56
	Early Morning	52-55	69-700	57-59	56-58	53-56	45-49	
	Night	42-55	57-70	48-59	45-58	41-56	38-49	

[a] Daytime hours are defined as between 7 AM and 10 PM, early morning hours are between 5 and 7 AM, and nighttime hours are between 10 PM and 7 AM.

[b] The Leq is an energy-average sound level defined over a specified period of time, often one hour. It is useful for representing the energy of a fluctuating sound with a single number. The Ldn is a similar to a 24-hour Leq, except the Ldn includes an additional 10 dBA added to sound levels in each hour between 10 PM and 7 AM to account for increased sensitivity to noise at night.

SLM1 – Located behind the Creekside Apartment complex. Noise sources included JBLM and civilian aircraft, including helicopters. The noise environment at the apartment complex was relatively quiet during deployment and retrieval of the meters.

SLM2 – Located at the Edmond Village Park to represent the residential setbacks from Center Drive. The primary noise source was traffic along Center Drive. Sporadic noise sources included aircraft noise, both military and civilian.

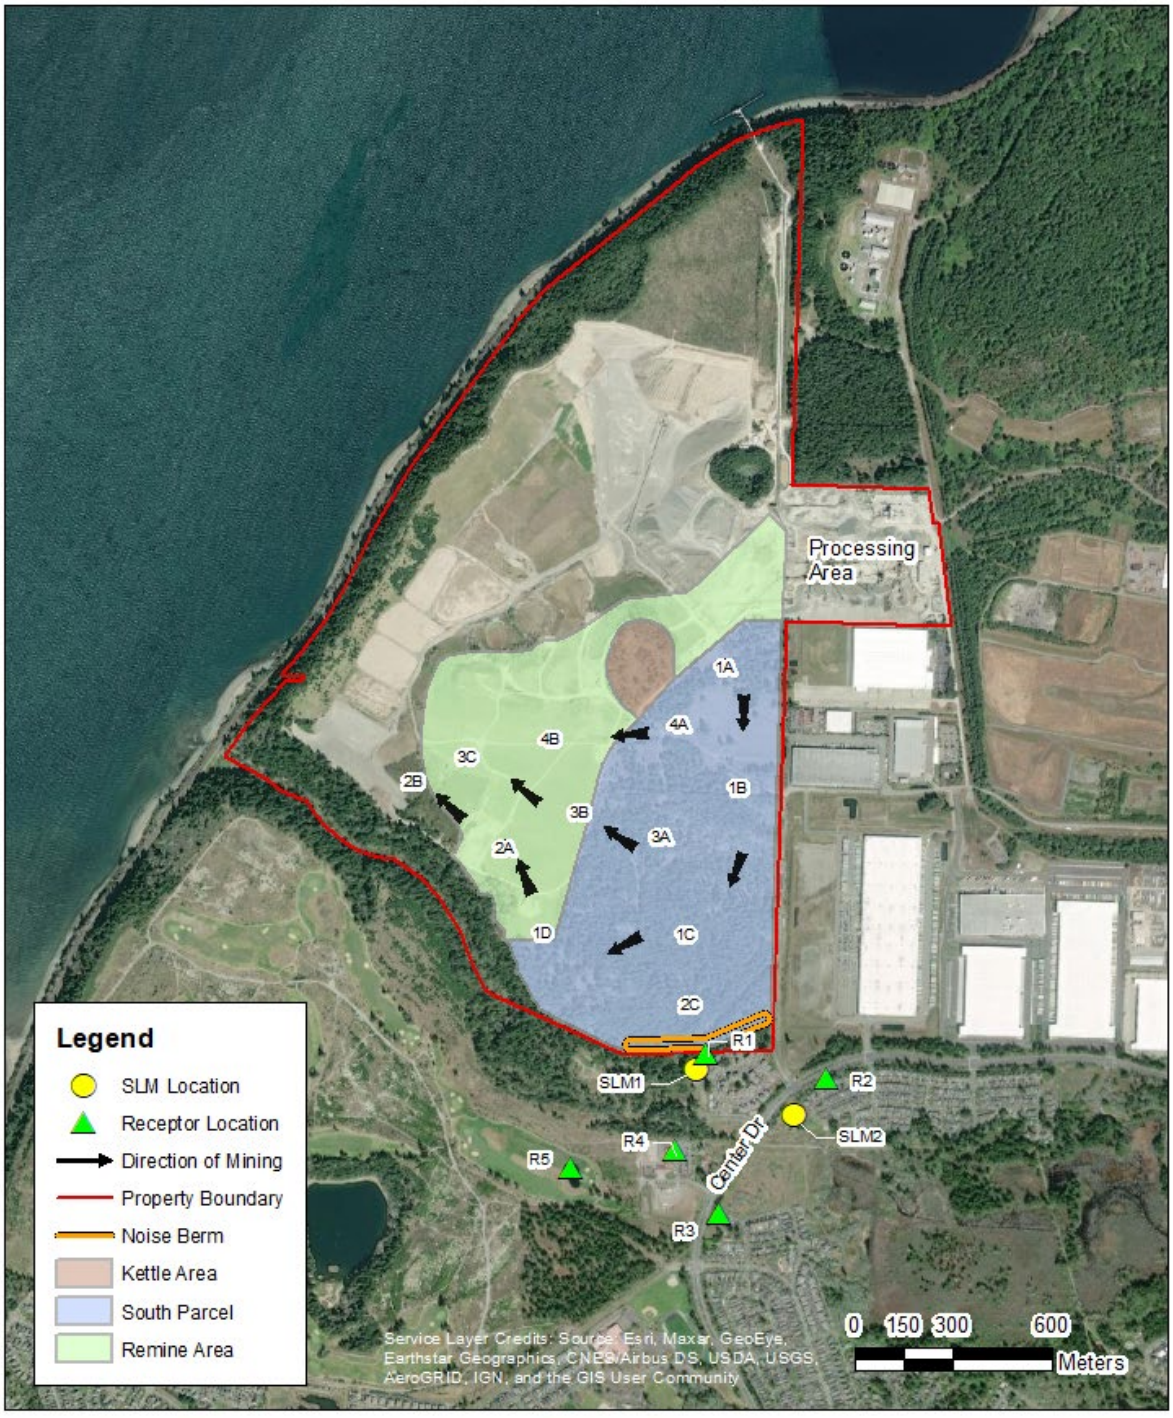

Figure 1. Sound Level Measurement and Model Receptor Locations

4. OPERATIONAL NOISE IMPACTS

The South Parcel Project will not substantially alter the majority of existing mining-related operations at the facility. The method of mining will be identical to that currently used in the permitted mine area. A dozer would push excavated material from the top of the mine face to two front-end loaders working on the mine floor. The front-end loaders would scoop-up the sand and gravel and dump it into portable hoppers that feed conveyors leading to the processing area. The material processing plants and barge-loading facilities would not change.

4.1 Noise Sources

Equipment required for mining the South Parcel includes two front-end loaders, a bulldozer, and conveyors and a electric conveyor drive motor. This equipment would work in tandem; the bulldozer would push material down the mining face to the loaders, which would load the material onto a conveyor going to the existing processing plant. The bulldozer and loaders would be the dominant noise sources at the nearest sensitive receivers to the South Parcel.

Noise from the excavation equipment was considered in noise modeling to estimate future noise associated with the facility. Noise from most equipment was characterized using measurements of equipment operating at the existing Pioneer Aggregates facility. The measurement of the electric conveyor drive motor was measured at a different facility and is from Ramboll's source sound level archives. The sound levels of the representative equipment are shown in **Table 4**.

Table 4. Mining Equipment Noise Levels (L_{25}/L_{eq}, dBA)

Equipment	Sound Level at 100 feet
Bulldozer	76
Front-End Loader	75
Electric conveyor drive motor	60
Conveyor	56
Source: Ramboll US Consulting	

Because the noise from a sand and gravel operation is typically fairly constant over the course of an hour, the noise standard that would be most limiting would be the hourly L_{25} limit. In order to more closely relate the calculated sound levels with the applicable noise limits, Ramboll used the measured L_{25} of each source when this information was available. However, not all of the equipment sound level information was available as an L_{25}. Because the noise generated by mining tends to be fairly continuous over the course of an hour, the sound levels of these operations described by the L_{eq} and L_{25} tend to be very similar. Therefore, in instances where L_{25} data were not available, Ramboll used the L_{eq} to represent an L_{25}.

4.2 Noise Model

Ramboll used the CadnaA noise model to estimate sound levels expected to be generated by the proposed mining expansion equipment. CadnaA is a computer program that calculates sound levels after considering the noise reductions or enhancements caused by distance, topography, ground surfaces, atmospheric absorption, and meteorological conditions in compliance with ISO 9613-2. The

modeling process included the following steps: (1) characterizing the noise sources based on frequency-specific measurements of representative equipment; (2) creating three-dimensional maps of the site and vicinity to enable the model to evaluate effects of distance and topography on noise attenuation, (3) assigning the equipment sound levels to the appropriate locations on the site, and (4) placing model "receptors" at several model receptor locations to represent places where the noise will be received.

4.3 Modeling Assumptions

The following assumptions were used in our assessment:

- The South Parcel will be mined in phases, beginning in the northeast section of the parcel and proceeding south and then west and northwest;
- The noise model evaluated mining activities in Phases 1B, 2C, and 3B to consider the range of sound levels that might occur from the South Parcel activities;
- For Phase 1B, much of the existing topography was assumed to be intact, providing some amount of intervening topography between the excavation equipment and the receivers to the south;
- For Phases 2C and 3B, most of the South Parcel was assumed to have been mined;
- For each phase considered, the noise model included one bulldozer pushing material down the mine slope, two front-end loader sat the toe of the slope loading material into a hopper, and a conveyor transporting material from the active mining area to the processing plant area;
- All equipment was assumed to operate concurrently and continuously;
- The South Parcel Expansion will not require increased capacity of the processing plants; and
- The site plan and noise model include a 20-foot high berm, constructed prior to mining of Phase 2C, located in the southeast corner of the site between the Creekside Apartments and the South Parcel. The berm will include trees and landscaping.

4.4 Noise Modeling Results

4.4.1 Compliance Assessment

As part of the noise assessment, Ramboll first compared the model-calculated sound levels with the applicable City noise limits to assess potential compliance with the limits. Sound levels from proposed excavation activities were modeled at six receptor locations representing three residential areas, a civic center, and a golf course nearest the South Parcel. The receptor locations are shown in **Figure 1**. The predicted future sound levels and detailed descriptions of each receptor location are provided in **Table 5**. Noise from the existing Pioneer Aggregates operations does not substantively contribute to the sound levels at the receptor locations considered in this assessment, and the predicted sound levels provided in **Table 5** can be considered representative of the entire operation with mining in the South Parcel.

As can be seen by the values in **Table 5,** sound levels from the proposed mine would easily comply with the applicable noise limits during daytime hours (i.e., 7 AM to 10 PM) at all locations. However, sound levels at the upper floors of the Creekside Apartments facing the site may exceed the noise limits if full mining activity occurs in Phase 2C during early morning hours (i.e., between 5 and 7 AM).

Because the dominant noise source at the Creekside Apartments during Phase 2C excavation is the bulldozer, Ramboll considered the noise benefits of restricting bulldozer use in this phase to daytime hours only. Prohibition of bulldozer use during the early morning hours results in modeled sound levels below the nighttime noise limits applied between 5 and 7 AM at all receptor locations.

Table 5. Model-Calculated Sound Levels (L_{eq}/L_{25}, dBA)

Model Receptor Location	Modeled Sound Level				Noise Limit [a]
	Phase 1B	Phase 2C	Phase 2C (No Bulldozer)	Phase 3B	
R1a	42	55	48	43	60/50
R1b	41	46	42	40	60/50
R2	40	45	43	37	60/50
R3	36	40	37	36	60/50
R4	37	39	36	38	65
R5	36	38	37	39	65

Receptor Locations:

R1a – Upper floor of the Creekside Apartments nearest the South Parcel

R1b – Ground floor of the Creekside Apartments nearest the South Parcel

R2 – Residences in Edmond Village

R3 – Residences in Palisade Village

R4 – Dupont Civic Center

R5 – The Home Course Golf Course

(a) The noise limits shown for residential locations are for daytime/nighttime hours, where daytime hours are from 7 AM to 10 PM and nighttime hours are from 10 PM to 7 AM.

Source: Ramboll US Corporation

4.4.2 Increases over Existing Sound Levels

In addition to evaluating the potential compliance of on-site sources associated with South Parcel activities, Ramboll considered potential noise impacts caused by project-related increases over existing baseline sound levels. This assessment was restricted to residential receptor locations potentially affected by project-related increases over existing levels.

For the project sound levels during daytime hours, we used the worst-case modeled levels expected during all phases of excavation. For the project sound levels during early morning hours, we used the worst-case modeled sound levels during all phases of excavation assuming *no bulldozer* in Phase 2C. Because mining activities in Phase 2C may exceed the nighttime noise limit of 50 dBA at the upper floors of the Creekside Apartments with all equipment in operation, use of the bulldozer in Phase 2C will be restricted to daytime hours only. The resulting increases over existing levels are displayed in **Table 6**.

Table 6. Calculated Increases Over Existing Sound Levels (Leq, dBA)

Model Receptor Location	Time of Day [a]	Measured Existing Levels	Level with South Parcel Expansion		
			Project Only [b]	Cumulative [c]	Increase [d]
R1a	Day	39-48	55	55-56	8-16
	Night	42-44	48	49-50	5-7
R1b	Day	39-48	46	46-50	2-8
	Night	42-44	42	45-46	2-3
R2	Day	49-54	45	51-55	0-1
	Night	52-55	43	52-55	0
R3	Day	49-54	40	50-55	0
	Night	52-55	37	52-55	0

Notes:

(a) Daytime hours are from 7 AM to 10 PM. Nighttime hours for the purpose of this evaluation are from 5 to 7 AM, when early morning excavation may occur.

(b) The daytime project levels shown are the highest modeled sound levels from all phases of South Parcel activities considered in this assessment. The nighttime levels shown are the highest levels from all modeled phases except 2C.

(c) Cumulative levels represent the existing measured sound levels + the modeled project-related sound levels.

(d) Apparent discrepancies in any calculated increases are artifacts of rounding the displayed sound levels to the nearest whole number.

Source: Ramboll US Corporation

As can be seen in **Table 4**, the sound levels when a bulldozer is working very near the project boundaries in Phase 2C are substantially higher than the baseline sound levels at the upper floors of the Creekside Apartments (R1a), resulting in potential increases of 8 to 16 dBA. If these sound levels were experienced throughout the life of the project, they would represent a substantial increase. However, the modeled levels at the Creekside Apartments are dominated by noise from a bulldozer working on the slope of 2C very near the southern project boundary. This worst-case condition would only occur during Phase 2C excavation. Even during Phase 2C excavation, the bulldozer would split its time between excavation in Phase 2C and excavation in the existing mining areas farther north and west, and sound levels much of the time would be substantially lower than the worst-case levels identified here. The variation in sound levels over the life of the mine and the variation in day-to-day bulldozer activities would reduce the potential noise impacts at the Creekside Apartments due to increases over baseline levels.

At the more distant residential locations (R2 and R3), increases over background sound levels are 1 dBA or less during even the worst-case Phase 2C activities. Such increases would not be discernable in an active outdoor environment and would result in no impact.

5. CONSTRUCTION

The material processing infrastructure that would be used to support South Parcel mining already exists. Construction directly related to the South Parcel would be limited to logging, preparation of new mining phases/segments for excavation, expansion of the on-site conveyor system to connect the

expanded mining area to the existing processing facility, and the construction of the berm on the south side of Phase 2C for noise attenuation.

Much of the construction activity would entail heavy equipment similar to, or the same as, the equipment required during excavation. Therefore, the sound levels of construction are expected to be similar to the modeled operational sound levels identified above. The exception would be sound levels associated with construction of the berm on the south side of Phase 2C. During construction of the berm, sound levels at nearby receivers may be noticeable and, at times, intrusive. This could result in temporary and short-term noise impacts at nearby properties. Construction activity is exempt from Dupont's noise regulations during daytime hours (7 AM to 10 PM).

6. MITIGATION

6.1 Operation

The plans for the site include construction of a 20-foot high berm on the south side of Phase 2C to reduce noise at off-site locations, especially at the Creekside Apartments. With such a berm, modeled sound levels of worst-case mining activities are well below the applicable daytime noise limits at all receptor locations.

Excavation in Phase 2C during early morning hours (i.e., between 5 and 7 AM) may exceed the stricter nighttime limit of 50 dBA applicable at the Creekside Apartments. The sound levels from Phase 2C activities affecting the Creekside Apartments is dominated by a bulldozer working at the top of the slope. Restriction of the bulldozer to daytime hours only within Phase 2C reduces the modeled sound levels at the Creekside Apartments to 48 dBA or less, which would comply with Dupont's nighttime noise limit.

6.2 Construction

Construction activities (i.e., logging and construction of the southern berm) would be conducted during daytime hours only (7 AM to 10 PM) to minimize noise impacts.

7. SIGNIFICANT UNAVOIDABLE ADVERSE IMPACTS

With construction of the proposed berm as noted above and with restriction of hours of bulldozer operation in Phase 2C to daytime hours only, the project is expected to fully comply with the Dupont noise limits. Furthermore, potential noise impacts at the Creekside Apartments (R1) can be mitigated by the proposed mitigation measures, although short-term unavoidable noise impacts may be expected. Due to the short-term nature of the impacts at R1, any such impacts would not be characterized as significant.

Visual Impact Analysis

CALPORTLAND DUPONT SOUTH PARCEL MINING AREA EXPANSION VISUAL IMPACT ANALYSIS

Project Description

CalPortland, a building materials company producing cement and construction material products, is applying to expand sand and gravel mining operations at their existing Pioneer Aggregates Mine site in the City of DuPont, Washington. The proposed project, referred to as the South Parcel Project, includes horizontal expansion of mining into approximately 188 acres previously undisturbed by mining (Expansion Area), and vertical expansion of approximately 125 acres where re-mining will deepen a portion of the existing Pioneer Aggregates Mine (Re-mining Area). See Attachment A for a more detailed project description.

The South Parcel Project site is located southeast of the existing Pioneer Aggregates Mine in the City of DuPont (known as "the City"). The site is within the City's designated Mineral Resource Overlay and is bordered to the north and west by the existing Pioneer Aggregates Mine, to the east by industrial/ distribution facilities, and to the south by Sequalitchew Creek and the Creekside Village residential development. See Attachment A, Figure 1 for a map of the project area.

This project is anticipated to extend the time allowance for mining at the current rate by approximately 14 years, subject to market conditions.

Affected Environment

The area affected by the proposed expansion includes a mixture of open grassland and mature, open prairie forest dominated primarily by Douglas fir. This forest cover varies in density throughout the site, typical for a south Puget Sound prairie landscape, but is comparatively dense on the eastern edge of the site, along Powerline Road and Center Drive. This forested evergreen buffer provides a measure of visual opaqueness to the site, such that passersby currently cannot view the existing mining operations.

Methodology

The visual impact methodology is intended to document the nature of the existing landscape, and to identify impacts to visual resources that would result from alteration of the landscape from mining and reclamation. This assessment relied on the preparation of computer-based visual simulations of the landscape that would result from mining of the expansion area. These simulations are a generally accepted means to evaluate the nature of proposed visual change. The landscape at the proposed mine site is uniform and lacking in defining features.

A number of key viewpoints were identified from a variety of locations around the site, in consultation with City of DuPont staff and their EIS consultant. The selected viewpoints are intended to be representative of viewpoints where public views toward the site are available, and to illustrate the significant visual impacts to the public from the Proposed Action (see discussion of Key Viewpoint Selection below). At each of these locations, existing conditions were photographed with a SonyA6300 camera at an equivalent focal length of 35mm and 50mm. These photographs were later used as a basis of comparison against simulated conditions at the same viewpoints.

Digital engineered survey drawings of both the existing landscape and the proposed final grading plans following mining and reclamation were provided by the applicant as AutoCAD Civil3D files. These digital grading plans were imported into Trimble SketchUp Pro software to create digital elevation models of the corresponding terrain. This terrain model was then imported to Lumion Pro software, where the site model was further developed with realistic textures and built features such as fencing, paving and utility poles being added in their proposed positions. Accurately detailed plant models were added to represent vegetative screening at various stages of growth — from new plantings up to mature growth. Within the environment of the site model, views were created to match the key viewpoint photographs.

The viewpoint perspectives were accurately generated by computer, which serves to limit human error and minimize artistic license in the simulation process. These perspective views began as 'wire-frame' views of the ground surface and were then imported to light and material rendering software Lumion Pro. The simulated viewpoints were accurately positioned using geolocation data noted onsite during the initial photography. For each of those locations, the view settings were adjusted to match the original camera setting for focal length in order to achieve the same field of view. The view was then aligned using reference objects between the simulated view and an overlay of the original photograph. Lighting conditions were also set within the model to match those of the respective existing conditions photograph. Ultimately, the rendered views of the proposed South Parcel Project conditions were compared with the original photographs to show the unaltered context around the simulated proposed conditions. Conclusions regarding relative degree of change or impact were then made on the basis of the final photo-realistic simulations.

Visual impact assessment is based on a combination of identifying potential for public view, evaluating existing visual quality, identifying viewer sensitivities, and evaluating degree of visual change resulting from a proposed project. For this analysis, levels of visual quality and viewer sensitivity are estimated based on criteria that establish ratings of "high," "medium," and "low." Visual change is qualitatively evaluated based on the visual simulations. By qualitatively combining rankings of visual quality, visual sensitivity, and the direct visual change identified in the simulations, an overall determination can then be made regarding the potential impact on a given viewpoint by the project. For example, mining-related actions at a

particular viewpoint may show a high level of impact in the simulations, but when combined with a low visual quality and sensitivity ranking, would be considered to have little overall impact to visual quality in that area.

Visual quality was evaluated using the following criteria:

- **Low**: Landscape is common to the region and exhibits few, if any, memorable features, or patterns that provide visual diversity. A prevalence of encroaching human elements or landscape modifications exists, which do not compatibly blend with the natural surroundings. Human alterations exhibit low maintenance, design quality, or siting sensitivity.

- **Medium or Moderate**: Landscape exhibits generally attractive natural and man-made features/patterns, although they are not visually distinctive or unusual within the region. The landscape integrity of the area provides some positive visual experiences such as natural open space with some existing disturbance or well-maintained development.

- **High**: Landscape exhibits distinctive and memorable visual features and patterns that are largely intact and undisturbed – usually a rural or open space setting. Development or visual disturbances, if present, are well planned to integrate with natural landscape materials or character.

Viewer sensitivity is dependent on viewer types and exposure to a proposed activity, number of viewers, availability of views to the proposed activity, view orientation and duration, and viewer expectation. Levels of viewer sensitivity were evaluated by the following criteria:

- **Low**: Viewer types represent viewers of low visual sensitivity including agricultural and industrial workers who are involved in their work and not focused on the landscape. Viewer numbers and view duration are low. Viewers have low expectations of experiencing high quality views and are not typically in search of a quality visual experience. Views are often screened or limited.

- **Medium or Moderate**: Viewer types represent viewers of medium visual sensitivity including recreationists and passing motorists. Viewer numbers and view duration are moderate in scope. Viewers have only a moderate expectation of experiencing high quality views and may or may not be engaged with the passing visual experience.

- **High**: Viewer types represent viewers of high visual sensitivity including tourists and homeowners. Viewer numbers and view duration are high, with views oriented towards a specific landscape or vista. Viewers have every expectation of experiencing high quality views and are often in search of a quality visual experience. Views are often wide and sweeping, or from a superior vantage point.

Key Viewpoint Selection

Due to existing topography and vegetation, there are very few locations outside the existing or proposed mining areas from which these operations are now visible or would be visible in the future. Natural topographic relief in the area is minimal, outside the Sequalitchew Creek Canyon, which is a relatively deep incision in the surrounding plateau. Although views into the site from outside the existing or proposed mining areas are minimal, proposed mining operations would remove some of the existing vegetation on

the project area, which would affect some off-site views. Therefore, a number of locations were considered as potential locations where simulations would be appropriate.

Key Viewpoints (KVPs) were selected to illustrate the greatest or "worst case" visual impact to the public from the Proposed Action. Analysts reviewed previous environmental analysis of the CalPortland Mining site including the Glacier Northwest DuPont Mining Area Expansion and North Sequalitchew Creek Project Draft and Final Supplemental EIS (City of Dupont, 2006 and 2007, respectively), CalPortland DuPont North Parcel Mining Final EIS, (City of Dupont 2013), and City of DuPont land use designations (City of Dupont, 2021). Analysts also made a site visit to familiarize themselves with the landscape context of mining operations during viewpoint selection and took photographs of the site from various locations near the site (ESA, 2022).

A viewshed analysis using Google Earth (2022) demonstrated that there are no surrounding areas of higher ground that afford views of the site (ESA, 2022). Aerial photos show that current mining operations have maintained vegetated buffers along the west and south sides of the mine. As a result, there are no views into the site from Puget Sound or the Sequalitchew Creek canyon. Views into the South Parcel Project site from the north are only available from the existing mine.

This preliminary information was presented to the City of Dupont, and viewpoints were selected in consultation with City of DuPont staff (EA Engineering 2022).

There are no public viewpoints of the project site to the west, due to presence of the vegetated bluff at the west perimeter of the mine along Puget Sound. No public viewpoints are available from the northwest; the only views are from the mining access road and the abandoned Fort Lewis landfill. Therefore, the viewpoints chosen for simulations are limited to locations to the south and east of the proposed mine.

Visual simulations were developed from the four KVPs around the proposed mine site where a view to the proposed mining activity is available (KVPs 1, 2, 3 and 4), as identified in **Figure 1-1**. A summary description and selection criteria for these four KVPs is provided in **Table 1-1**. These viewpoints were chosen to provide representative depictions of the future landscape that would best illustrate proposed project changes from a variety of viewpoints. To the degree possible, "sensitive" viewpoints were selected from locations accessible to the public; these were believed to potentially impact the greatest number of people.

The four other viewpoints (KVPs 5, 6, 7 and 8) were considered but simulations were not considered necessary because the project site is blocked from view by vegetation and/or topography and would remain so during and after mining at the project site. This included a view at the west end of Sequalitchew Drive (KVP 5); a public road that is expected to be eventually extended but currently serves as an access point to a public trailhead; a typical view looking northwest towards the project site along Sequalitchew Trail (KVP 6); and a view from a semi-public viewpoint – The Home Course golf course south of Sequalitchew Creek (KVP 7). For these viewpoints, photos are included showing the approximate location of the project site beyond the vegetation and topography that obstructs views of the site.

The information in the 'Selection Rationale' column in **Table 1-1** represents the result of both site visits and consultation with City of DuPont Staff. This information, along with additional knowledge gained from subsequent site visits and analysis, was used as input for the preparation of the visual simulations. All

simulations prepared for this analysis are included in Attachment B in full page layout, in addition to the images in this report.

Figure 1-1 South Parcel Project Key View Points

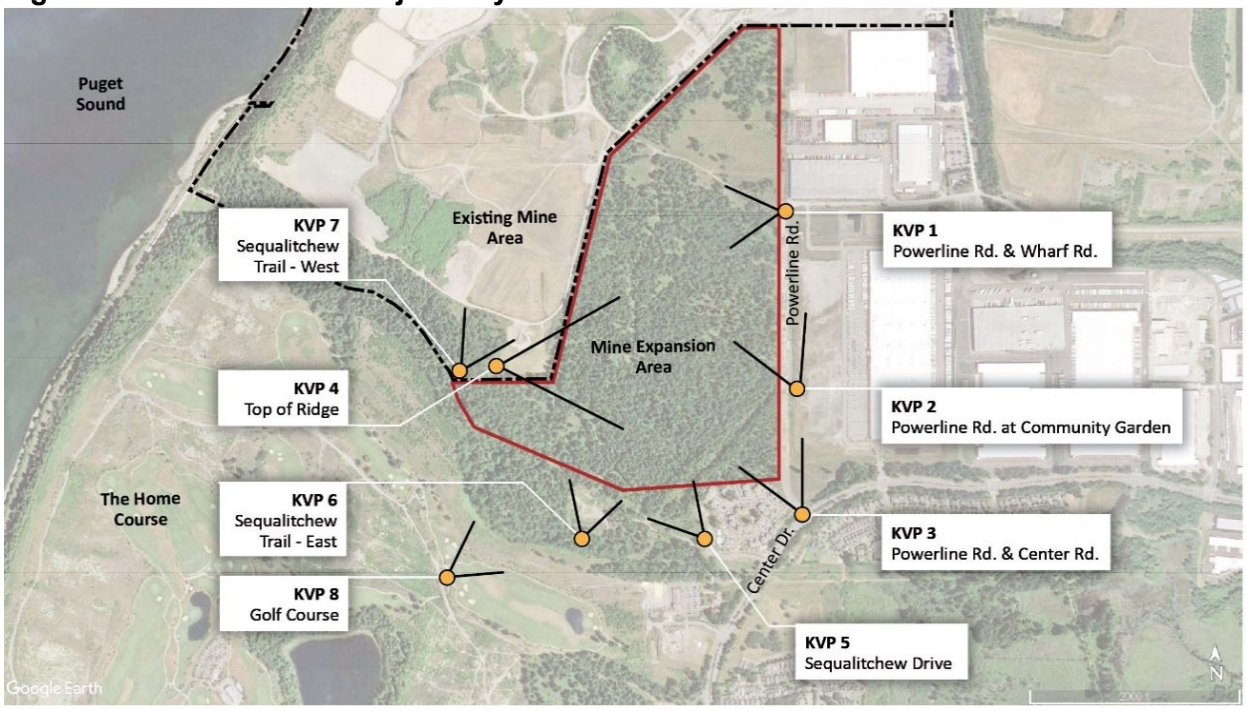

Table 1-1. Summary Description of Simulation Key Viewpoints (KVPs)

Key Viewpoint Description	Location and Viewers	Selection Rationale
1: Powerline Rd. at Wharf Rd. This viewpoint lies along Powerline Road at the point where there is a 90-degree bend in the road. The camera angle is looking in a westerly direction, down into the basin of the new creek bed.	Private Road: Vehicle passengers	Wharf Road is used primarily by trucks turning around for the adjacent warehouses, but Wharf Road is open to the public. Pedestrians and cyclists using Powerline Road can access this intersection. Views of vegetation along this road would be heavily affected.
2. Powerline Rd. at Community Garden. This viewpoint lies on the east side of Powerline Road near the south entrance to the community Garden. The camera angle is looking in a northwesterly direction.	Private Road: Garden users, cyclists, pedestrians.	Community garden users can drive to the community garden on Powerline Road. Pedestrians and cyclists also use Powerline Road.
3: Powerline Rd./Center Dr. This viewpoint lies on the northwest side of the intersection of Powerline Road and Center Drive. The camera angle is looking in a northwesterly direction.	Public: Vehicle passengers, DuPont residents	This represents a key public viewpoint. The public traveling along Center Drive can look into the site along the proposed access road and have a glimpse of the site alteration that is taking place. The view would be affected by removal of existing vegetation as part of mining operations...
4: Top of Ridge This viewpoint sits on top of the ridge between the active mining site and Sequalitchew Creek, at the southwest edge of the Expansion Area. The camera angle is looking in east northeast direction, giving an overview of the mine site after mining and restoration are complete.	Private: CalPortland employees	This viewpoint models a view that is located on the privately-owned site and is not available to the public. There currently is no public road or trail providing access to this spot. An observer must climb from the existing mine road up a small brush-covered knoll to reach it. Although not public, the viewpoint offers an extensive view of the project from above, which is intended to help the reader understand the character of the project landscape after reclamation.
Key Viewpoints considered but not simulated		
5: Sequalitchew Drive. This viewpoint lies at the current west end of this road, where public trail users frequently park. The camera angle is looking in a northwesterly direction.	Public: Trail users	This viewpoint shows where the project site stands in relation to this popular public trailhead along Sequalitchew Creek. Vegetation and topography block views of the project site.
6: Sequalitchew Trail - East This viewpoint lies on the public trail leading down to the Sound. The camera angle is looking in a northerly direction.	Public: Trail users	This viewpoint shows where the project site stands in relation to this popular public trail along Sequalitchew Creek. Vegetation and topography along Sequalitchew Creek block views of the project site.
7: Sequalitchew Trail - West This viewpoint lies on the public trail leading down to the Sound. The camera angle is looking in a northwesterly direction.	Public: Trail users	This viewpoint shows the lower portion of Sequalitchew Creek Trail at approximately the closest point on the trail to the project site. Because the site is directly uphill from this location, the view is not facing the site but shows the slope along the trail's north side. Vegetation and topography along Sequalitchew Creek block views of the project site and would not be affected.
8: The Home Course (Golf Course). This viewpoint lies near the edge of the golf course, near the edge of the Sequalitchew Creek ravine. The camera angle is looking in a northerly direction, toward Sequalitchew Creek and the project site.	Semi-Private: Golfers/Recreationists	This viewpoint shows where the project site stands in relation to the golf course. Vegetation within the golf course and along Sequalitchew Creek block views of the project site.

Simulations of the Proposed Action

Visual simulation of the project required depiction of vegetation removal and changes in topography, as well as revegetation of the landscape at a future point in time. The photos used for the 2006 Draft SEIS and 2013 EIS (City of Dupont 2006, 2013 respectively) capture a wider perspective than what the average human eye typically sees from a fixed position. In the versions presented here, due to the perspective of the KVPs, this approach would have minimized the effect on the views, therefore the images have a narrower perspective, more like what a human eye would focus on. To account for growth rates of woody vegetation, such as found in western Washington, growth rates from the Washington State University Extension program were used. An annual growth rate of 13-24 inches was applied to coniferous plant material in the simulations — with each plant model having a randomized size within the range of growth for the time of depiction. These growth rates generally reflect similar ongoing restoration area efforts within the existing mine. The growth rates are not guarantees of future plant growth, but act as an accepted method for modeling potential growth.

For the purposes of this analysis, simulations were prepared at three future points in time, referred to as Year X, Year X+ and Year Y. Where the proposed mining is not visible behind trees or another obstruction, the mine/portion of mine will be shown with hatching, brackets, or another method (See KVP 5, KVP 6, KVP 7 and KVP 8).

For KVP 1, 2 and 3, Year X simulates the view when the visual impact of the project would be the greatest. This is expected to occur in approximately two years from the beginning of mining). Tree planting along Powerline Road to provide a visual screen of mining activities at this location is in progress as of (late 2022) and completion of planting depends on seasonal factors. The fence would be moved to the eastern site boundary either when the trees are planted or at some time before the site is cleared to begin the mining operation. Vegetation on the site would be removed from the eastern perimeter except in buffer areas shown on the plans, in order to ready the site for mining to begin. An access road, temporary powerlines and newly planted trees would be installed to the west of the fence. In Year X, the trees are expected to reach heights between three and five feet. In Year X, trees would be removed from all areas to be mined. While there may be shrubby vegetation that remains in areas that will not be immediately mined, both the timing and the degree of clearing needed to remove the trees is difficult to predict. Therefore, for the simulations all areas to be mined are assumed to be either unvegetated or to have a native groundcover seeding.

At KVP 2, an additional simulation, Year X+ simulates the view approximately five years after the trees along Powerline Road have been planted, establishing a dense conifer screening that is expected to reach heights between eight and twelve feet by Year X+. A simulation was prepared for this future point in time for KVP 2, the most public-facing viewpoint at the eastern perimeter along Powerline Road near the Dupont Community Garden.

For all KVPs, Year Y is chosen to depict conditions ten years after the end of mining, when revegetation of the site is well established. Mining of the South Parcel is assumed to take approximately 14 years. Therefore, Year Y would be approximately 24 years after project inception. By that time, it is assumed that

the temporary powerlines along the east perimeter would have been removed and woody vegetation such as trees and shrubs would have been established on the slopes.

Year X and Year Y simulations were prepared for KVP 1, 2, and 3. KVP 4 is from a location where the public would not be permitted to be present, so a simulation was only prepared for the Year Y condition. Most of the interior mined areas are shown as reclaimed after mining with a native groundcover seeding. These areas are intended to eventually be developed for urban uses in the future, following completion of mining operations, and the reclamation area would likely change in the context of site-specific development.

Existing Conditions at Viewpoints

The following discussion describes existing conditions at the identified viewpoints.

KVP 1: Powerline Road at Wharf Road

The photo below was taken from the centerline of Powerline Road, immediately south of the right-angle bend, looking directly westward into the future mining expansion area. The gravel road on the right-hand side of the photo is an active service road for the existing mining operations. These operations are currently screened by existing mature vegetation that is typical of south Puget Sound prairie forests. The dense forest seen on the left side of the photo is typical of the dense buffer of Douglas fir that is found along the west side of Powerline Road from KVP 1 south to Center Drive.

The visual quality is judged to be moderate. No extended views are present. Existing vegetation is a mixture of disturbed and undisturbed vegetation. Some visual clutter is present, such as fences and gates.

Viewers are expected to be of a low sensitivity, including the occasional local motorist, bicyclist, or pedestrian. The landscape is common to the region and a prevalence of encroaching human elements or landscape modifications exist, which do not compatibly blend with the natural surroundings.

KVP 1 EXISTING

KVP 2: Powerline Road at Community Garden

This photo was taken from Powerline Road at the existing Dupont Community Garden between Wharf Road and Center Drive, looking northwest towards the proposed project.

The visual quality is judged to be moderate. No extended views are present. Existing vegetation is a mixture of disturbed and undisturbed vegetation. Some visual clutter is present, such as fences, gates, and signage. The east side of Powerline Road is dominated by large transmission line poles and overhead wires.

Viewers are expected to be of a low to moderate sensitivity and be more numerous than KVP 1. Viewers include the community garden users, and the occasional local motorist, bicyclist, or pedestrian, and City staff accessing a plant nursery. The landscape is common to the region and a prevalence of encroaching human elements or landscape modifications exist, which do not compatibly blend with the natural surroundings.

KVP 2 EXISTING

KVP 3 Powerline Road and Center Drive

This photo was taken from the berm on the east side of Center Drive (facing directly toward the proposed mining expansion site), approximately 15 feet back from the east-bound travel lane, directly in line with the centerline of Powerline Road as it intersects Center Drive. The character of the landscaped median of Center Drive contrasts strongly with the more haphazard nature of the distant landscape of firs and Scotch broom west of Center Drive. The existing power transmission towers following Powerline Road are clearly visible in the middle-ground of the photo. The dense forest of mature Douglas fir in the background is typical of the forest buffer along the eastern border of the proposed sand and gravel extraction site. It is a continuation of the forest seen in the left-hand side of the photo seen previously in KVP 2 Existing. This forest continues with similar density for approximately 1,800 feet to the west, directly away from the photo viewpoint. The density of the forest in the far-left hand side of the photo continues west along the existing Sequalitchew Creek all the way to Puget Sound, over 1.25 miles to the west.

The visual quality is judged to be moderate. The view is a mixture of mature second-growth forest in the background contrasting with a developed arterial collector road in the foreground, the Creekside Village Apartments on the left side of the view, and a high-tension power transmission line in the middle-ground.

Viewers are expected to be of medium sensitivity, including workers or residents of DuPont, as well as visiting recreationists driving along Center Drive.

KVP 3 EXISTING

KVP 4 Top of Ridge

This photo below illustrates the existing view from KVP 4. This photo was taken from a high point on the ridge between the Sequalitchew Creek canyon and the existing mine area. The viewpoint is on an existing mine site, in an isolated, inaccessible location, requiring a hike through unmarked forest. Although members of the public would not typically see it, the viewpoint was selected as one of the simulation viewpoints because it gives an unobstructed view of the South Parcel Project mining area. The grassy field in the foreground consists of reclaimed area from the existing mining operations that was re-contoured and hydroseeded. The forest in the background is the western edge of the forest first observed in KVP 2 Existing (in that photo, the viewer sees the eastern edge of this forested area).

Visual quality is classified as medium, with sweeping open views of the landscape and mature forests in the background. The middle ground view is dominated by the newly reclaimed mine area, showing evidence of recent vegetation growth.

Viewer sensitivity was not classified, as this view is on private property and will not be accessible once mining excavation begins. As noted, this view was simulated to help the reader understand the scope and extent of the mining operation, even though it is not from a place where the public would see the South Parcel Project.

KVP 4 EXISTING

KVP 5 Sequalitchew Drive

This photo illustrates the existing view from the current west end of Sequalitchew Drive. The camera angle is looking in a northwesterly direction towards the proposed project. Sequalitchew public trail users frequently park near this location. The photo shows the gravel trail entrance with residential structures in the background. The existing vegetation is comprised of evergreen native conifers and invasive scotch broom, which has overtaken the understory and open areas along the trail. The foreground includes a wooden fence, an “authorized vehicles only” sign and concrete slab with three wooden bollards painted white at the top to indicate the entrance to Sequalichew public trail.

KVP 5 EXISTING

KVP 6 Sequalitchew Trail- East

The photo below was taken from the center of the existing historic railroad bed to the southwest of the South Parcel Project. The photo shows the density of existing vegetation in the creek canyon, which obscures any clear view of the steep canyon walls. Viewers would be expected to be of high sensitivity, principally hikers, and other recreationists using the proposed trail system based on the existing old narrow gauge railway path. Visual quality is judged to be high, with an attractive view of a mature second-growth forest surrounding the viewer.

KVP 6 EXISTING

KVP 7 Sequalitchew Trail- West

The photo below shows the lower portion of Sequalitchew Creek Trail at approximately the closest point on the trail to the project site. The site is directly uphill from this location, so the view is not facing the site but shows the slope along the trail's north side on the right-hand side of the photo. Existing vegetation and topography along Sequalitchew Creek currently block views of the project site. Viewers are expected to be of high sensitivity, principally hikers and other recreationists. Visual quality is judged to be high, with an unbroken view of the forest and Sequalitchew Creek Trail.

KVP 7 EXISTING

KVP 8 The Home Course (Golf Course)

The photo below was taken from the top of a high knoll at the north side of the Home Course, a privately owned golf course immediately south of Sequalitchew Creek. This knoll is the highest point of land along the north side of the golf course. The tree line observed in the photo marks the top of the slope leading into the canyon. Viewers are expected to be of high sensitivity, principally users of the future golf course. Visual quality is judged to be high, with an unbroken view of an attractive mature second growth forest viewed across an open grassy meadow.

KVP 8 EXISTING

Impacts of the Proposed Action

Proposed Action

KVP 1 Powerline Road at Wharf Road

The deep excavation resulting from new mining operations of the Proposed Action would eliminate the mature trees that screen the existing mining operations from along Powerline Road. The beginnings of reforestation efforts are visible in the Year X simulation, which will eventually allow new trees to grow up and screen the views again. However, it will take 5 to 7 years to develop a full screen and longer for a more mature forest to develop. While visual change is evident, the Proposed Action would not have a significant adverse visual impact at Viewpoint 1. This is due to the lack of sensitive viewers, and the relative rapidity with which the landscape is expected to recover. Most of the unobstructed view from the road is expected to be screened within a five-year period due to vegetation regrowth. Existing and future views are shown below to help the reader see the degree of change.

KVP 1 EXISTING

KVP 1 YEAR X

KVP 1 YEAR Y

KVP 2 Powerline Road at Community Garden

KVP 2 is located on Powerline Road at the existing Dupont Community Garden between Wharf Road and Center Drive, looking northwest towards the South Parcel Project. Powerline Road extends from the foreground to the background. This angle was selected to show the angle from which most users, drivers of cars, and pedestrians, would view the South Parcel Project site. Evergreen trees will be planted along the property line adjacent to Powerline Road; estimated planted in fall/winter of 2022/2023, depending on weather conditions and the availability of trees. Prior to the beginning of mining the existing chain link fence will be moved to the property line.

Shrubby vegetation and large evergreen trees currently block views of the South Parcel Project site. That vegetation would be removed at the beginning of mining the South Parcel. An access road would parallel the east property line and would have temporary overhead powerlines to power dewatering wells. Removal of the second growth conifers and ground cover will contrast sharply with current conditions and will temporarily open up views of the South Parcel Project, an industrial use that is currently not visible from this location. Overhead lines would add an element of visual clutter. Given the sensitivity of viewers, this is considered a moderate impact on visual quality; the impact would be mitigated by the evergreen screening that would limit the duration of this impact.

In Year X, the site would be partially screened by densely planted evergreens along the fence line. By Year X+, the trees are expected to grow to approximately 8 to 12 feet in height. By Year Y, mining would be complete along this section. The power poles used for dewatering shown in Year X and Year X+ would be removed. Additionally, the fence along the perimeter would be removed in Year Y. The trees may be thinned as required for overall health. Existing and future views are shown below to help the reader understand changes over time.

KVP 2 EXISTING

KVP 2 AT YEAR X

KVP 2 AT YEAR X+

KVP 2 AT YEAR Y

KVP 3 Powerline Road and Center Road

The photo below is taken from the west side of Center Road looking northwest. Vehicles traveling on the west side of the Center Road would be going southwest, so this view is more like one that a pedestrian would see than what would be seen from a vehicle. The location and direction were selected to maximize the potential amount of disturbance visible in the simulation from the roadway.

Existing and future views are included to portray changes over time. As shown in the simulation of KVP 3 at Year X, the cut through the forest is clearly visible on the right-hand side closest to the power pole. The simulation demonstrates that the mining operation would not be visible from KVP 3. This is due to the grading, which causes the land to fall away quickly from the viewer. Additionally, a 20-foot-high berm planted with trees and other native landscape vegetation would be placed in this area to shield residents in Creekside Village Apartments from potential visual and auditory impacts resulting from mining activities in the expansion area. The South Parcel Project would not have a significant adverse visual impact at this KVP, due to a low degree of visual change, combined with the moderate existing visual quality and viewer sensitivity. The trees, which are cleared at Year X, would show regrowth by Year Y, although it would take many more years beyond Year Y before the trees would reach the same height as existing trees.

KVP 3 EXISTING

KVP 3 AT YEAR X

KVP 3 AT YEAR Y

KVP 4 Top of Ridge

This KVP occurs at the high point on the ridge between the Sequalitchew Creek canyon and the existing mine area. The viewpoint is on an existing mine site not typically seen by members of the public. It was selected as one of the simulation viewpoints because it gives an unobstructed view of the South Parcel Project mining area.

The scene in the Year Y simulation below depicts the interior of the mine following the completion of mining activity and restoration. In the foreground, the ground plane is relatively level with only minor variations in terrain. In the background, plateau benches step up towards the south end of the site to anticipate and facilitate future development. All side slopes are shown with dense tree plantings whereas the floor of the mine is relatively open having only been hydroseeded with native ground cover. Along the distant horizon, the screening vegetation effectively obstructs Powerline Road beyond.

Although the visual environment has been altered in this viewpoint, the impact is not judged to be significant. This is due to the inaccessibility of the viewpoint and total absence of sensitive viewers on the west and south sides of both the existing and proposed mining sites.

KVP 4 EXISTING

KVP 4 AT YEAR Y

KVP 5 Sequalitchew Drive

Vegetation and topography block views of the project site, which is generally indicated by the shaded band. all trees visible from this view are off-site from the project and would not be affected. this view has not been simulated as the visible trees are privately owned. viewers would be expected to be of high sensitivity, principally hikers, and other recreationists using the trail system. Visual quality is judged to be high because this is an established hiking trail.

KVP 5

KVP 6 Sequalitchew Trail- East

At KVP 6, all trees are located offsite and would not be affected by proposed mining, therefore no change to visual quality would occur as a result of this project. Sequalitchew Creek is below the trail to the left and the viewer is surrounded by lush undisturbed vegetation.

KVP 6

KVP 7 Sequalitchew Trail- West

The site is directly uphill from this location and is not visible; the view provided in the photo below shows the slope along the trail's north side on the right-hand side of the photo. Vegetation and topography along Sequalitchew Creek block views of the project site and would not be affected. All disturbance associated with the South Parcel Project will be outside of Sequalitchew Creek Park and set back a minimum of 100 feet from the top of the slope of Sequalitchew Creek Ravine. All trees in the photo below are offsite from the project and would not be affected. Viewer sensitivity and visual quality would not change as a result of the project site.

KVP 7

KVP 8 The Home Course (Golf Course)

The photo below was taken from the top of a high knoll at the north side of the Home Course, a privately owned golf course immediately south of Sequalitchew Creek. This knoll is the highest point of land along the north side of the golf course. All trees visible from this viewpoint are off-site from the project and would not be affected. Similarly, viewer sensitivity and visual quality would not be affected.

KVP 8

Cumulative Impacts

Cumulative impacts to views could, hypothetically, occur due to clearing that has taken place on the original mine and the North Parcel of the Pioneer Aggregate Mine. From viewpoints around the South Parcel Project, including KVPs 1, 2, and 3, however, there are no views of the original Pioneer Aggregate mine or the North Parcel. When clearing of the South Parcel occurs as part of the Proposed Action, views of the original mine and North Parcel would be temporarily opened up. The screening that is proposed for the South Parcel Project along the east perimeter will screen these views after the plantings reach a height of six feet or greater which is expected to occur by Year X+ or sooner. Views at KVP 5, 6, 7, and 8 would not be affected by clearing of the South Parcel; trees seen in the photos at those KVPs are located offsite. As such, cumulative impacts would be limited to the first few years prior to Year X. No other cumulative impacts are anticipated.

Impacts of the No Action Alternative

There are two No Action Alternatives- Scenario A Continuation of Existing Conditions; and Scenario B Site Development Under Existing Zoning.

In Scenario A Continuation of Existing Conditions, mining activities associated with the Re-Mine Area of the site and the Existing Mine would continue as currently permitted. The mining operation would retain a vegetated buffer at its perimeter with no lighting, and the interior of the mine would likely not be seen from existing public places. The Existing Mine has an estimated remaining life of 6 to 10 years with mining currently limited to 10 feet above groundwater. The South Parcel portion of the site is assumed to remain undeveloped and would continue in its vegetated condition.

In Scenario B, Site Development Under Existing Zoning, the proposal would not occur. The site would be developed for urban uses consistent with the City's Future Land Use Map. No attempt has been made to simulate the effects of future development; simulation would require the preparation of a development plan for the site which would be speculative. The majority of the area affected is currently designated by the City of DuPont Comprehensive Plan as Manufacturing and Research, with a smaller area designated for residential uses (City of Dupont 2021). The corner of the property near Center Drive is designated as Residential 12, which would allow higher density residential development where multifamily density averages 12 units per acre (City of Dupont 2021). Urban development, as permitted under current planning and zoning designations, would occur east of the lease line demarcating existing mining operations. The timing and nature of any such development would be driven by market forces.

In general, future structures would rise above the ground level and would be more visible within the surrounding landscape than the proposed South Parcel Project mining operations. Light and glare from buildings, the street, and security lighting would extend these effects into the nighttime hours. Future development would draw a greater number of daily users and viewers into the property than currently have access to it, both physically and visually. The degree of visual change outside of the property could be as great as or greater than the South Parcel Project, depending on buffer vegetation and the visual intensity and bulk of structures.

Mitigation Measures

The visual impact of the South Parcel Project is not expected to be significant. However, the following mitigation measure is proposed to further decrease the magnitude of potential impacts:

- Maintain a vegetated buffer along Powerline Road. Trees will be planted densely to establish screening during mining operations. After mining is completed, selective thinning may be necessary to facility a healthy future forest within the buffer.

Significant Unavoidable Adverse Impacts

The South Parcel Project would result in significant and unavoidable change to the visual character of the existing landscape within the proposed expansion area. The extraction of mined material will make this change virtually irreversible, because of the cost of transporting enough fill to replace the extracted sand and gravel. However, the South Parcel Project is not expected to result in a significant adverse effect to the visual environment of the surrounding community. The mining operation is expected to be only minimally visible to the general public from outside of the property boundary. In addition, mining is a transitional use of the site; although mining would alter the site for a number of years, after mining is complete, the site will likely be developed to another use.

Traffic Impact Assessment

TECHNICAL MEMORANDUM

Project: **Pioneer Aggregates– South Parcel Project**

Subject: Traffic Impact Assessment

Date: July 18, 2022

Author: Marni C. Heffron, P.E., P.T.O.E.
Principal, Heffron Transportation, Inc.

Glacier Northwest (dba CalPortland) is seeking a permit to expand its existing Pioneer Aggregates Gravel Mine in Dupont, Washington. This expansion (hereafter referred to as the "South Parcel Project") would increase the mine footprint and extend the life of the mine. Current mine operations on the North Parcel and the respective transportation-related impacts were assessed in the June 2013 *Final Environmental Impact Statement (FEIS)*.[1] This memorandum evaluates the potential transportation impacts associated with the South Parcel Project and compares those to impacts previously evaluated in the FEIS.

1. Current and Planned Mine Operations

The Dupont Pioneer Aggregates Gravel Mine is located at the north end of the City of Dupont. The existing processing plant is accessed from Pioneer Avenue. The mining areas and processing plant location are shown on Figure 1.

Current Operations

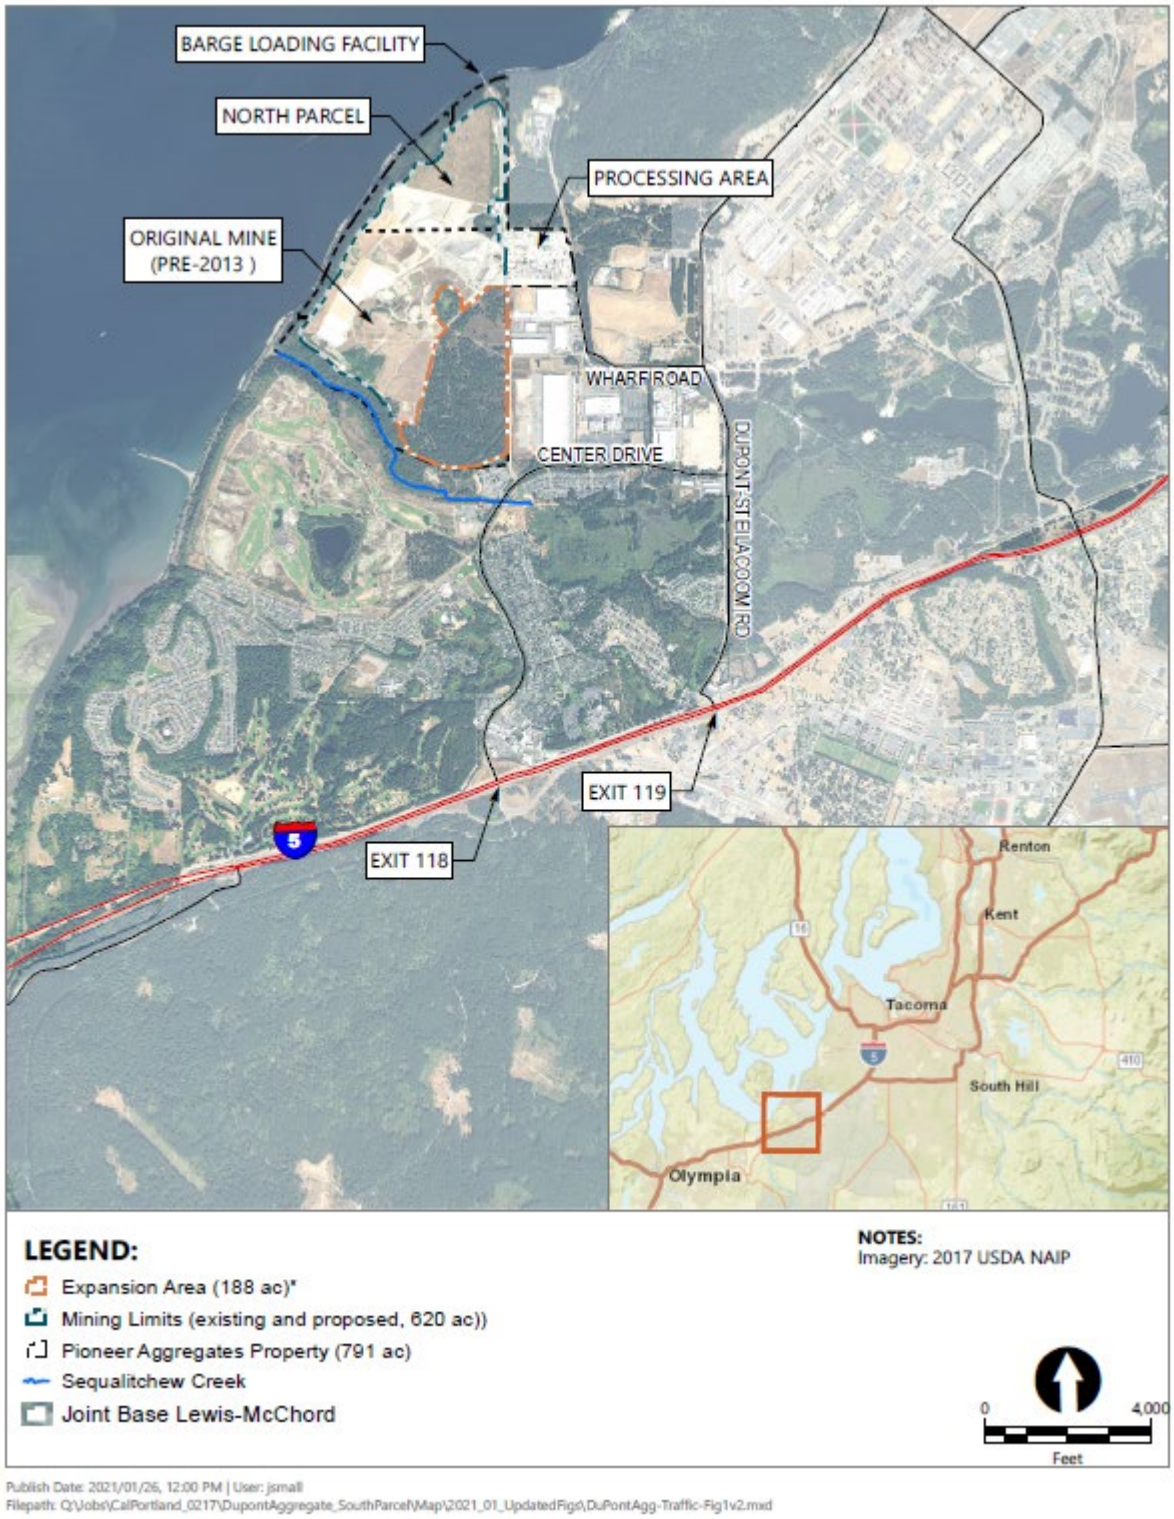
The mine, processing plant, and barge loading dock at Tatsolo Point have been in operation since 1997. The expansion of the mine to the 142-acre North Parcel (described in the 2013 *FEIS*) assumed extraction of approximately 2.8 million cubic yards of sand and gravel annually. It also assumed that 80% of that aggregate would be transported by barge, the same rate that had been historically barged before expansion. The remaining 20% was assumed to be exported from the site by truck, either as mined aggregate or as part of processed concrete. Section 2 of this memorandum presents information about the *FEIS*-estimated truck and employee traffic volumes, along with data about actual truck loads for the five years between 2015 and 2020.

Future Operations with South Parcel Project

The South Parcel Project would expand the footprint of the existing mine to include the 188-acre expansion area shown in Figure 1. It would increase the existing sand and gravel resources available to mine by 30 to 40 million cubic yards, and extend the life of the mine by an additional 14 years. This relates to an annual extraction rate of between 2.1- and 2.8-million cubic yards -per-year, which is similar to the maximum rate of extraction defined in the *FEIS*. CalPortland expects that 80% of the aggregate would continue to be transported by barge with the remaining aggregate exported by truck. The processing plant would remain in its current (and historic) location.

[1] City of Dupont, *Final Environmental Impact Statement for CalPortland Dupont North Parcel Mining,* June 2013.

Figure 1. Site Vicinity and Mining Operational Areas



2. Existing Mine-Generated Traffic Volumes

Predicted by FEIS

The 2013 *FEIS* included detailed trip generation estimates for the mine (see Chapter 3.11), which were based on historic operations and annual extraction rates. The trip generation estimates assumed that 20% of the mined aggregate would be transported from the site by truck (the remaining 80% would be by barge and not affect roadways). *FEIS* Table 3.11-4 summarized the trip generation estimates, and is presented below.

FEIS Table 3.11-4. Summary of Project-Generated Off-Site Trips

Trip Type	Vehicle Type	Daily	AM Peak Hour			PM Peak Hour		
			In	Out	Total	In	Out	Total
Typical Day								
Employee Commute	Automobile	126	3	0	3	0	3	3
Service & Deliveries	Light Truck	18	2	2	4	2	2	4
Product Transport	Heavy Truck	246	9	9	18	1	1	2
Logging [1]	Heavy Truck	0	0	0	0	0	0	0
Total		390	14	11	25	3	6	9
Peak Day								
Employee Commute	Automobile	200	7	3	10	0	4	4
Service & Deliveries	Light Truck	30	5	2	7	3	3	6
Product Transport	Heavy Truck	710	25	25	50	5	5	10
Logging [1]	Heavy Truck	24	0	0	0	0	0	0
Total		964	37	30	67	8	12	20

Source: Final Environmental Impact Statement for CalPortland Dupont North Parcel Mining, *June 2013.*

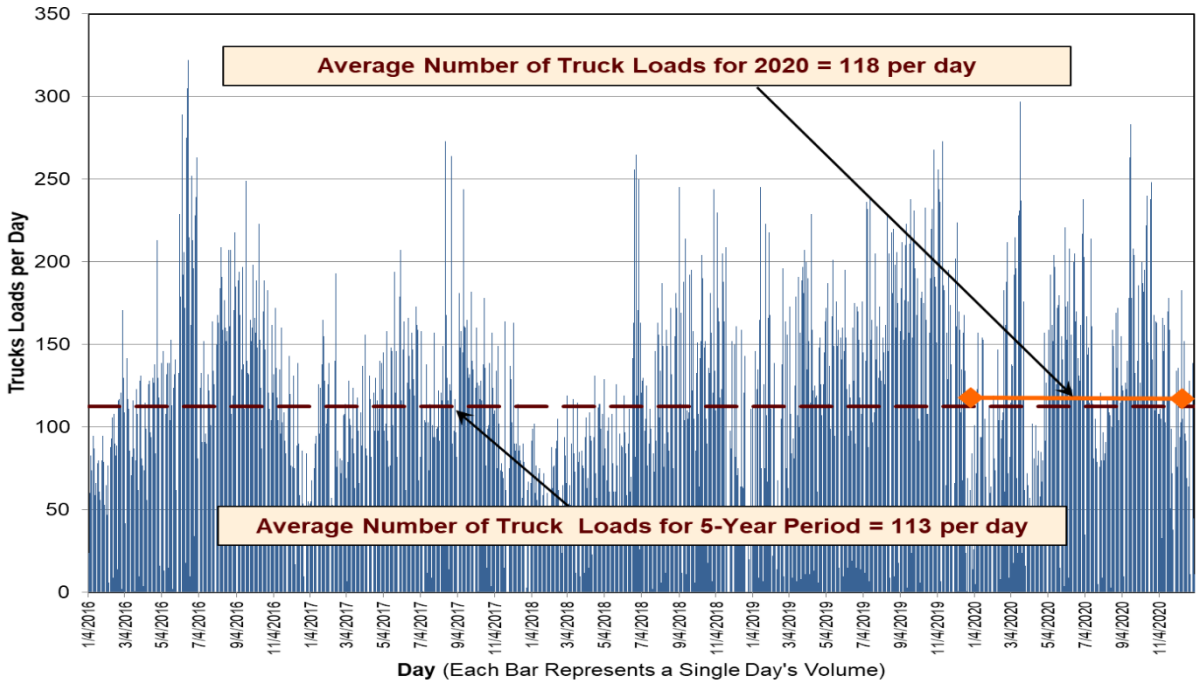
1. *Logging the North Parcel would occur only during the first year of operation.*

The FEIS had estimated that the mine would generate an average of 390 trips per day (195 trips entering the site and 195 trips exiting the site). Of these, 264 trips per day (132 inbound and 132 outbound) would be truck trips. On the peak day, daily trips were expected to increase to 964 trips per day (482 inbound and 482 outbound) of which 764 would be truck trips (382 inbound and 382 outbound). Trips during each of the commuter peak hours—AM and PM—were also determined. More traffic was expected to occur during the AM peak hour when product is typically transported out to construction sites. During the peak day, the mine was expected to generate 67 AM peak hour trips (37 inbound and 30 outbound). The PM peak hour would have much lower volumes, expected to be 20 trips on the peak day (8 inbound and 12 outbound).

Actual Truck Trips – Years 2016 through 2020

CalPortland tracks all trucks that exit the site with a load of material (e.g., truck loads). Five full years of data (from January 1, 2016 through December 31, 2020) were obtained from CalPortland and compiled to show the number of truck loads that exit the site each day. It is noted that each truck load reflects an outbound trip (an inbound trip is made by an empty truck and is accounted for later in the analysis). Figure 2 below shows each day's concrete and aggregate loads (trucks exiting the site).

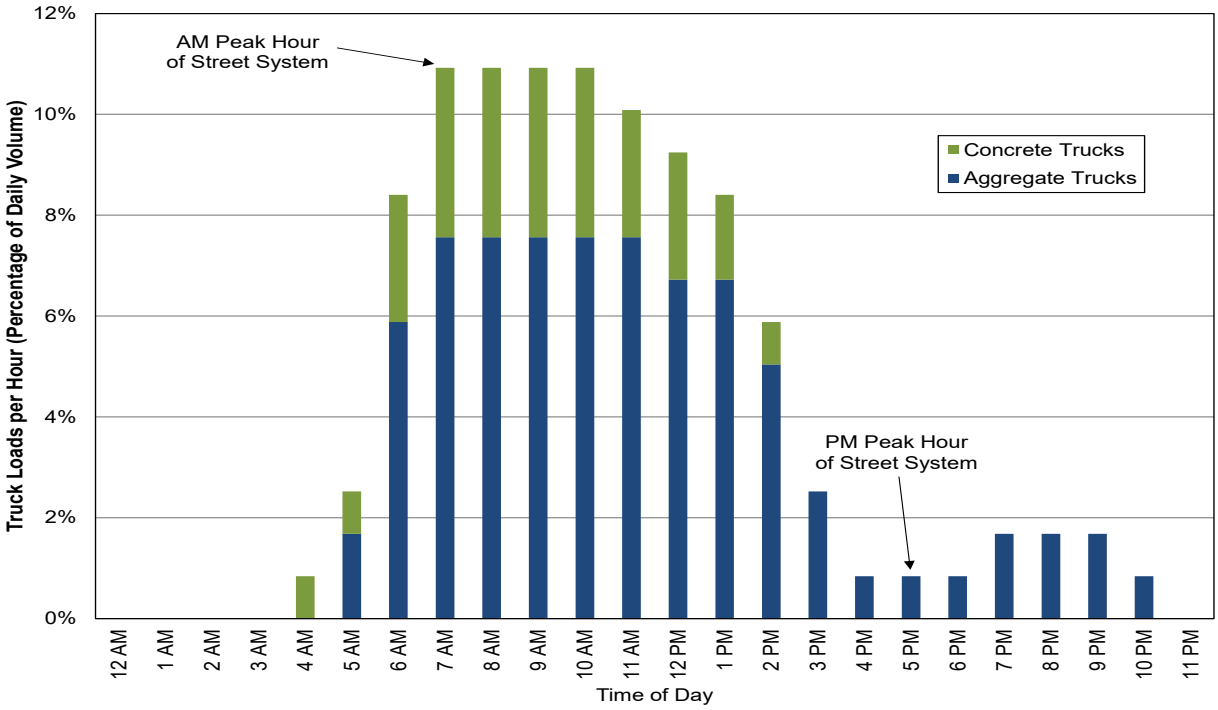
Figure 2. Daily Truck Loads (Outbound Truck Trips) – Actual for Years 2016 through 2020



Source: CalPortland Data compiled by Heffron Transportation, Inc., February 2022.

More detailed information was compiled for 2020. While the COVID-19 pandemic affected activity during some weeks of the year, the total aggregate mined was 2,776,615 cubic yards, just below the 2.8 million cubic yards anticipated by the FEIS. The average truck loads per day over the five-year span (113 truck loads per day) were very similar to the average for the year 2020 (118 truck loads per day). Further analysis was performed for the full year of 2020 data to derive average truck loads by time of day. Figure 3 shows the percentage of each day's trucks for each hour.

Figure 3. Percent Trucks by Hour – Weekday (2020)



Source: CalPortland Data compiled by Heffron Transportation, Inc., January 2021. Data reflect the average of full year of truck loads from 2020.

Table 1 compares the daily and peak hour truck trips from 2020 to those assumed in the *FEIS.* A total of 118 truckloads were processed on the average day in 2020, which results in 236 truck trips (empty truck inbound plus loaded truck outbound). The peak day of the year had 297 truckloads, equaling 594 truck trips. The total daily trips were below the level estimated in the *FEIS*. Actual AM peak hour trips were slightly higher for an average day (26 trips compared to the estimated 22 trips), but lower on the peak day (52 trips compared to the *FEIS* level estimated 57 trips). PM peak hour trips were lower for the average day and the same as expected for the peak day.

Table 1. Comparison of *FEIS* Truck Estimates to Actual Truck Volumes

Trip Type	Daily	AM Peak Hour			PM Peak Hour		
		In	Out	Total	In	Out	Total
FEIS Estimated Truck Trips [a]							
Average Day	266	11	11	22	3	3	6
Peak Day	740	30	27	57	8	8	16
Actual Truck Trips – Year 2020							
Average Day [b]	236	13	13	26	1	1	2
Peak Day [c]	594	26	26	52	8	8	16
Absolute Peak Day in Five- Year Period (06/15/2016) [d]	644	13	49	62	10	2	12

a. *Source:* Final Environmental Impact Statement for CalPortland Dupont North Parcel Mining, *June 2013.*
b. *Based on average loads per hour for all of year 2020.*
c. *Based on actual loads for the Peak Day in 2020 (March 18, 2020).*
d. *Highest day in five-year period between 01/01/2016 and 12/31/2020. This day had substantial concrete truck activity associated with a continuous pour operation.*

As shown above on Figure 2, the absolute highest volume in the past five years (June 15, 2016) generated 322 truck loads or 644 truck trips per day. This day had a very high number of concrete truck trips associated with a continuous-pour operation. The actual trips for that day were compiled to determine the peak hour volumes. The daily and PM peak hour trips were below the values assumed in the FEIS, but the AM peak hour was slightly higher due to the high number of outbound trips in the morning for the continuous pour. That type of event is very rare, and those volume levels were only observed one time in the five-year period.

3. Future Traffic with South Parcel Expansion

The South Parcel Project would allow for continued mine operations that are similar to those already permitted. The processing plant would remain in the same location, and the market area and travel patterns are expected to remain the same. Trip generation is expected to continue at current levels and would remain below the peak day estimates that had been evaluated in the 2013 *FEIS*. Expansion to the South Parcel would have a short period when logging trips are added to the traffic stream. The *FEIS* had estimated up to 24 logging truck trips per day (12 loads). This is likely to be conservatively high since the timber to be logged on the South Parcel is of poorer quality than for the previously-logged North Parcel.

The 2013 *FEIS* had evaluated traffic operations at area intersections for the future horizon year of 2035. The year 2035 conditions had accounted for substantial growth in traffic due to a dozen major development projects and background growth, and were consistent with assumptions in the *I-5 Joint Base Lewis-McChord (JBLM) Transportation Analysis*.[2] Impacts of the project were evaluated for the peak day condition, which as shown above, reflect a higher trip condition than occurred during the peak day in 2020. The *FEIS* traffic operations analysis found that, "…*project-generated trips are expected to constitute 3 percent or less of total trips through the LOS E and F intersections in the AM peak hour, and less than 1 percent in the PM peak hour. This reflects projected conditions on a day of peak mining operations; on days of more typical mining operations, these proportions would be even lower."* It goes on to conclude, *"Because the project-generated trips would represent a small proportion of traffic volumes at the study area intersections and would have negligible effect on the levels of service at the I-5 ramps and city intersections, no adverse level of service impacts are project to result from the South Parcel proposal."* The conclusion is still reasonable given that the trips are expected to remain similar to or less than those evaluated in the *FEIS,* and that the horizon year evaluated (2035) is reasonable to capture the extended life of the mine with expansion to the South Parcel.

4. Summary

The South Parcel Project is not expected to exacerbate transportation conditions in the study area. Trip generation is expected to continue at current levels and would remain below the peak day estimates that had been evaluated in the 2013 *FEIS*. Traffic operations had been evaluated in the *FEIS* for the anticipated South Parcel traffic and extended mine life, and concluded that the South Parcel would not adversely affect traffic operations in the site vicinity. This conclusion is still reasonable.

Re: Pioneer Aggregates South Parcel Mine Expansion Parking Narrative

The purpose of this memorandum is to provide a narrative describing the existing and proposed parking and employee count related to the CalPortland South Parcel Mine Expansion Project. Current and proposed parking meets the requirements of Dupont Municipal Code (DMC) 25.95. The South Parcel Mine Expansion will not result in any change to the operation or employment at the facility. The project does not include erection or modification of any buildings. Parking for employees will remain the same at approximately 60 spaces for personal vehicles, plus additional space for company owned vehicles including trucks, trailers and heavy equipment. The total employment associated with CalPortland's existing mining operation in DuPont, an estimated 60-100 jobs depending on market conditions.

A paved parking lot with disabled parking and access is available at the mine office. Space in this lot is also available for high occupancy vehicles. Bicycles are not allowed inside the gates of the mine for safety reasons. Spaces in this lot meet the city standards for stalls and aisles set forth in DMC 25.95.050. Two additional gravel lots are located between the processing plant and Pioneer Ave and between the concrete batch plant and Solo Point Road. The gravel lots provide flexibility to accommodate more employee vehicles as needed in response to fluctuations in demand. Vehicle and pedestrian traffic are controlled throughout the site to protect worker safety and the site is closed to the public. There are established vehicle and pedestrian travel routes used to access parking areas, buildings and other locations on the site as well as for ingress and egress from the site.

In summary:

- The number of spaces provided is and will remain consistent with DMC 25.95.030 (1)
- The locations for parking are and will remain consistent with DMC 25.95.40
- Preferential Parking requirements are and will continue to be met consistent with DMC 25.95.070
- Parking areas have been developed in consistency with the provisions of DMC 25.9.5050 where applicable (gravel lots are not striped) and will remain so.

- Preferential parking provided meets and will continue to meet the requirements of DMC 25.95.060
- All loading and unloading facilities are and will remain in off street locations that do not impede or interfere with traffic on public roads.

1. Overview of Fiscal Condition Assessment

Purpose

This report provides a reasonable analysis examining the tax revenues generated at the project in contrast to the costs of service that can be allocated to site. The analysis examines these revenues and costs that can be attributed to the site from an annual current year (2022) perspective given the best information available.

It should be noted that the analysis is limited to estimated revenues directly accruing to the City general fund. Indirect revenues, such as B&O taxes paid by companies providing repair and maintenance services to CalPortland, and charitable cash or in-kind contributions such as those made to the City Parks Department or DuPont Historic Society are not included. Similarly, the analysis does not identify all revenues generated by the CalPortland proposal that would accrue to other levels of government, including the State of Washington, or to non-city service districts, such as the school district. Although not quantified in this analysis, these revenues would benefit the respective governmental entities. In addition, the analysis does not address indirect effects to the broader economy, such as spending by employees or potential attraction of complementary businesses to the City.

Project Context

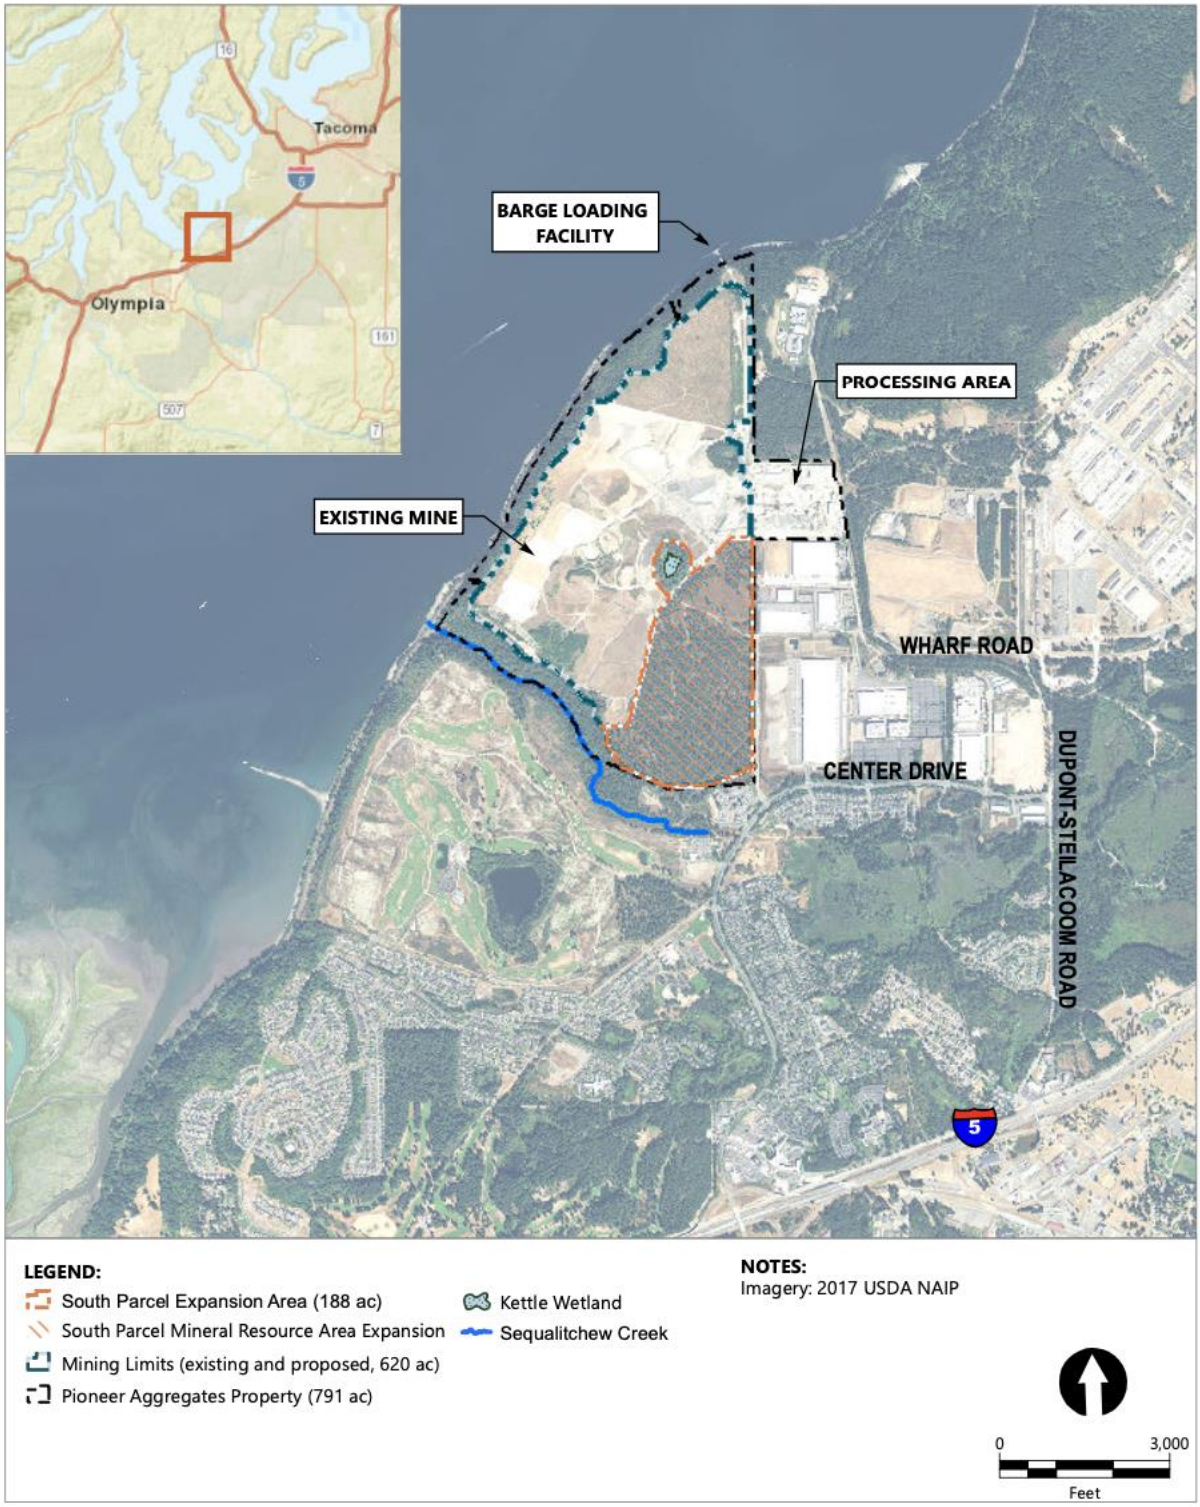
CalPortland's original sand and gravel mine was permitted in 1997 (355 acres). As provided under the Settlement Agreement, CalPortland applied for permits in 2013 for the North Parcel Mine Expansion to allow mining of approximately 142 acres within the North Parcel. Following the publication of a Final EIS in June 2013, the North Parcel mining expansion was permitted in 2014.

Mining activities at the existing site include mining, processing, transport of sand and gravel, and manufacturing of concrete. The processing area is located adjacent to the mine site on a 52-acre parcel owned by Glacier. Sand and gravel are removed from the mine by bull dozers and wheel loaders and transferred to the processing area by conveyor belts. At the processing facility, the material from the mine is crushed, washed, and separated into different size gradations. Aggregate products are stored in stockpiles in the processing area for distribution.

After completion of the production process, most of the finished aggregate products are transported from the plant area by conveyors and placed onto barges (approximately 80 percent) at Glacier's dock and barge-loading facility at Tatsolo Point. The remainder (approximately 20 percent) is sold as aggregate or used to make concrete on-site; in both cases it is transported by truck (see map below for context).

Exhibit 1: Pioneer Aggregates South Parcel Project Context Map

Source: Anchor QEA



Project Proposal Description and SEPA

The proposal is to expand the mining operations currently occurring on the North Parcel to the South Parcel. The South Parcel Project would include horizontal expansion of mining into approximately 188 acres previously undisturbed by mining, and vertical expansion of approximately 125 acres where re-mining will deepen a portion of the existing mine. The South Parcel Project would extend mining at the current rate for approximately 14 additional years.

The City of DuPont is the lead agency for SEPA review for projects within the city and is responsible for performing the statutory duties required for the Pioneer Aggregates South Parcel Project. Based on review of the May 2021 application materials submitted on the current project, the City of DuPont, as SEPA lead agency, determined that this project may have significant adverse impacts on the environment, and that an EIS should be prepared, consistent with RCW 43.21C.030 (2)(c).

The EIS will address probable significant adverse environmental impacts of the proposed Pioneer Aggregates South Parcel Project and will build upon the information and analysis in other environmental review for the mines at the site. While fiscal and economic issues are not required components of an EIS, the city has requested that it be studied. The purpose of this analysis is to understand how the existing mine operations contribute to both the tax revenue picture to the city as well as public service costs.

2. Existing Fiscal Conditions

City Fiscal Overview

Fiscal conditions presented below provide background about the revenues, expenditures, and tax bases of the city of Dupont. This analysis is focused on general government funds primarily include the city's General Fund which accounts for services to the public including public safety, street maintenance, land use, parks and recreation, and administrative functions. These services are largely supported by taxes, fees and charges, and intergovernmental revenues (i.e., state and federal contributions). This analysis is specifically focused on the taxes used to support the city's public services.

The analysis does not include the enterprise funds related to operating the Water Utility and Stormwater Utility. These enterprises are operated like a stand-alone business where with customer user fee are used to support all operating costs. Resources of the utilities cannot be used to subsidize general government functions.

City Tax Revenues Sources

This section discusses the city of Dupont's primary tax revenue sources and trends from 2011 to 2021. Unless cited otherwise, informing this memorandum is data from Washington state's Local Government Financial Reporting System for the city of Dupont. As with many cities in Washington State, the three largest revenues sources for the City of Dupont are (1) property taxes, (2) sales and use taxes, (3) utility taxes, and (4) business and occupation taxes (B&O). Taxes made up 74% of the city's overall revenue in 2021.

Current Expense Property Taxes

Initiative 747 limited local property tax increases to 1.0 percent each year, resulting in an erosion of the tax's purchasing power over time. Because of the method for calculating Dupont's property tax levy (equal to the 101% of the previous year's levy plus new construction add-on value), new construction is important to the city's ability to limit the erosion of the purchasing power of the property tax and to grow the levy beyond the statutory limitations. In 2023, property tax levy $2,014,558.

EMS Property Taxes

The city also collects a regular property tax for emergency medical services provided by the city. In 2023, property tax levy is $877,716.

Local Option Retail Sales and Use Taxes.

One of the key revenue sources that cities rely on is the retail sales tax. Of the 9.4% sales tax currently collected in the city on general retail purchases, a 1% "local" share of the tax accrues to local jurisdictions. The city receives 85% of the 1% local tax and Pierce County gets 15%. The

current rate accruing to the city is 0.85%. The local option sales tax generated $2,353,599 in local sales tax revenues for the city in 2021. This tax is levied not only on businesses in the area, but also on construction activity and some transactions that are related to housing, such as certain online purchases. The city also receives a population pro-rata share of 90% of the city allocation of Pierce County's 0.1% criminal justice sales tax.

Business and Occupation Taxes

This category of revenue includes monies received from business and occupation taxes on general business activities. The B&O tax rate in DuPont is 0.1%. The B&O tax generated $746,828 in tax revenues for the city in 2021.

Utility Taxes

The city levies a business and occupation tax on utilities; however, this tax is passed on to users of the utilities as part of their periodic bills. The city levies the following rates to the gross receipts of the utility providers:

- Electricity: 6%
- Water: 12%
- Sewer: 6%
- Stormwater: 10%
- Telephone: 6%
- Natural Gas: 6%
- Solid Waste: 8%

The utility tax generated $ $1,647,377 in tax revenues for the city in 2021.

Other Revenue Sources

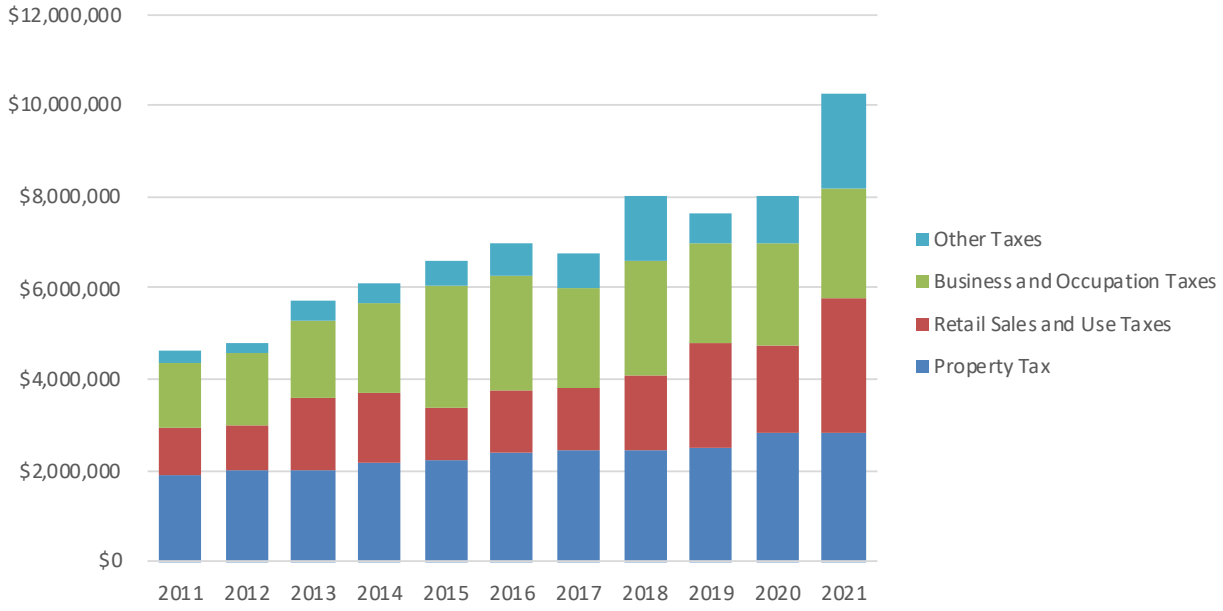
The City of Dupont collects revenues from a range of other local sources, including:

- Hotel/Motel Tax: The city receives a sales tax credit against the state portion of the sales tax of 2% on accommodations purchases. The proceeds of the tax are dedicated to economic development purposes supporting the tourism sector.
- Real Estate Excise Tax (REET). Real estate transactions are subject to a 0.50 percent local tax on the value of the transaction. REET revenues are restricted to finance capital projects. REET revenues are uncertain, given the volatility in the real estate market. Since REET is based on the total value of real estate transactions each year, the amount of REET revenues the city receives can vary substantially from year to year based on the normal fluctuations in the real estate market.
- Admission Tax. The city charges a tax on the value of transactions on admissions to a place or event. The admissions tax rate in DuPont is 5%.

City Tax Revenue Trends

Exhibit 2 presents a summary tax revenue for the city from 2011 to 2021. B&O tax revenues include both the tax on business gross receipts and utility providers (utility taxes). Property taxes have been a consistent and growing source of revenue for the city over the time. Sales taxes have also grown but a more volatile source of funding. The city has seen stronger relative growth in its B&O taxes (gross receipts and utility taxes). Other taxes are primarily consisted of the REET.

Exhibit 2: Summary Trends of Major Taxation Sources, City of Dupont, 2011 through 2021
Source: Washington State Auditor, Local Government Financial Reporting System.



City Expenditures

This section discusses the City of Dupont's primary expenditures and trends from 2011 to 2021. Unless cited otherwise, informing this memorandum is data from Washington state's Local Government Financial Reporting System for the city of Dupont.

City Expenditure Categories

The City of Dupont's major expenditures are as follows:

Public Safety

This category of expenditures includes costs for law enforcement, fire and emergency medical, detention/corrections, protective inspection services, and dispatch services. As of 2021, expenditures for public safety accounted for 55 percent of total city-wide expenditures.

General Government

This category of expenditures includes costs for personnel and centralized services; legislative, and executive activities; financial, recording, and election activities; and legal. As of 2021, expenditures for the general government accounted for 21 percent of total city-wide expenditures.

Transportation

This category of expenditures includes roads/streets maintenance, roads/streets administration and overhead. As of 2021, expenditures for transportation accounted for 7 percent of total city-wide expenditures.

Culture and Recreation

This category of expenditures includes library and park facilities costs. As of 2021, expenditures for culture and recreation accounted for 10 percent of total city-wide expenditures.

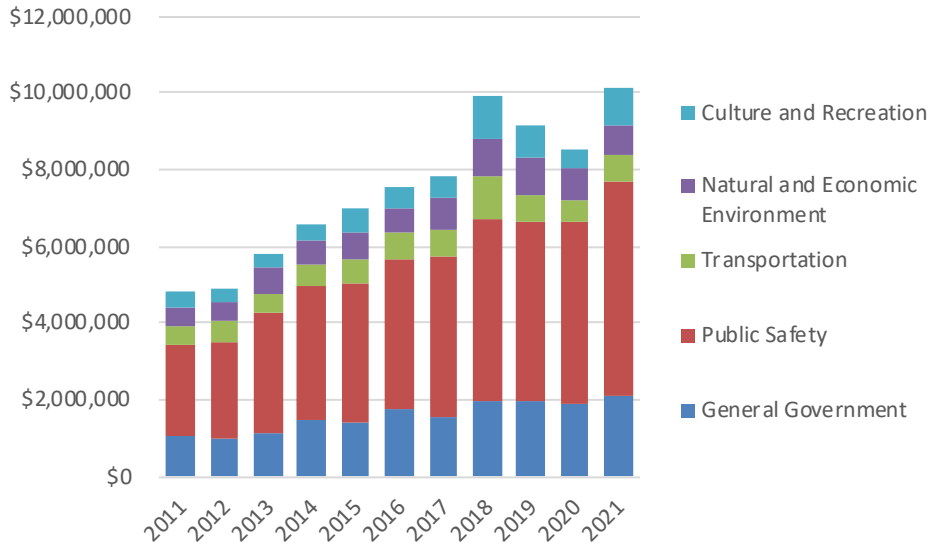
Natural and Economic Environment

This category includes work in community and economic development. As of 2021, expenditures for culture and recreation accounted for 7 percent of total city-wide expenditures.

City Expenditure Trends

Expenditures in the City of Dupont totaled $10.1 million in 2021, up from $4.9 million in 2011 (104 percent change).

Exhibit 3: Summary Trends of Expenditures, City of Dupont, 2011 through 2021
Source: Washington State Auditor, Local Government Financial Reporting System



Selected City Tax Bases

This section provides background on the following:

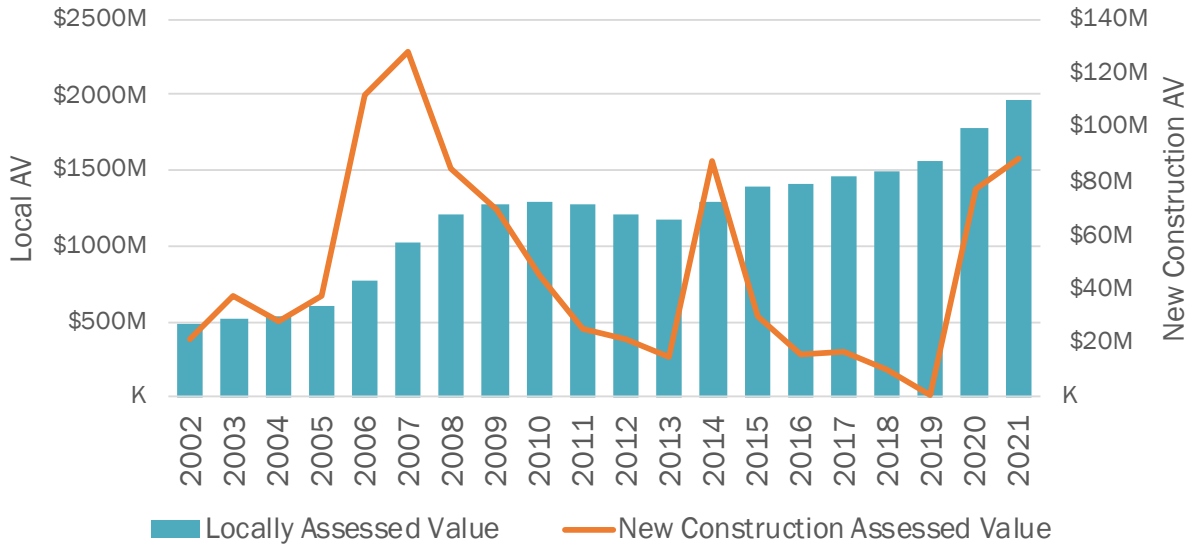
- Assessed value and new construction trends.
- Taxable retail sales trends

Assessed Value and New Construction

The Pierce County Assessor assesses the land and improvement value of all properties in the county for the purpose of levying property taxes. The assessor also values the amount of new construction for calculating the amount of "add-on" value to property tax collections. The trends for the city follow.

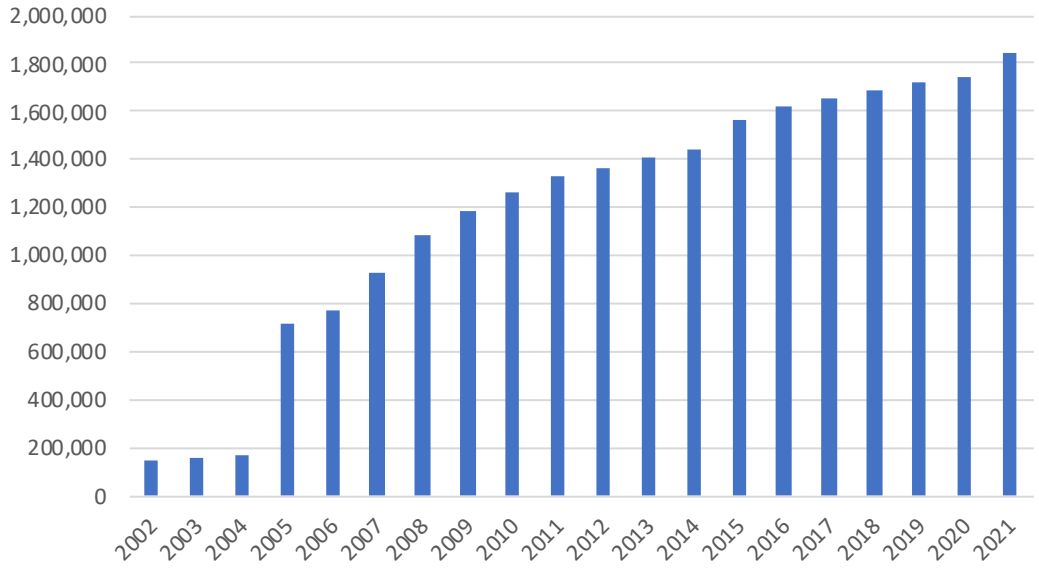
- In 2011, Dupont's local assessed value (AV) was $1.9 billion, about $1.5 billion more than local assessed value estimates in 2002.
- Valuation from new construction added substantially to Dupont's base from 2006 through 2009. The Great Recession did, however, cut this trend short. In 2010. New construction levels have picked up in the last several years but continue to be at levels lower than they have in the past.

Exhibit 4: Assessed Value and New Construction, City of Dupont, 2002 through 2021
Source: Washington State Department of Revenue.



Most taxing jurisdictions in Washington state must ensure that the amount of revenue they levy in the current year will not exceed the amount levied in the preceding year (plus additional funds for new construction, improvements to property, newly constructed wind turbines, solar, biomass, geothermal facilities, if the facility is not state assessed, increases in the value of state-assessed property, annexations, and refunds). In 2021, Dupont's highest lawful levy was $ $1,971,024 prior to the additional funds for new construction.

Exhibit 5: Highest Prior Levy, City of Dupont Regular Levy, 2002 through 2021
Source: Washington State Department of Revenue.

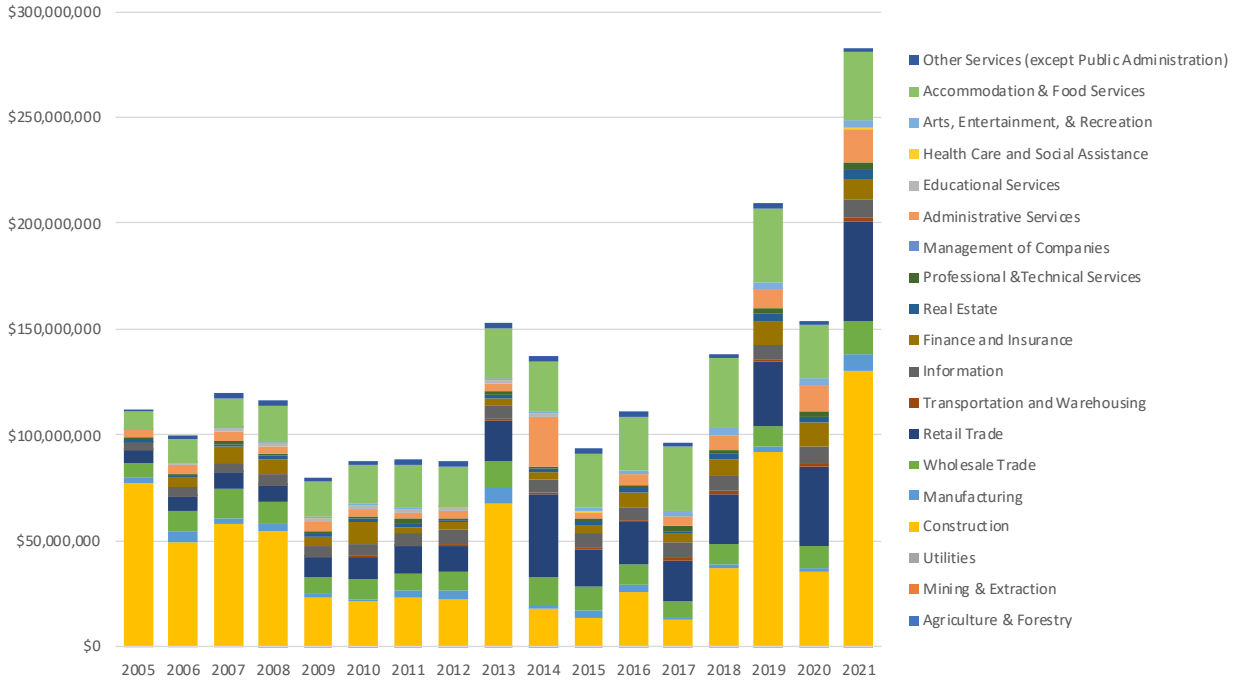


Taxable Retail Sales

Retail sales reflect spending that occurs within the city and is a significant source of tax revenue for the city.

- Taxable retail sales (TRS) have grown steadily over the last several years. Total sales (particularly for the construction sector) dipped following the onset of the recession (around 2009), but sales have since increased.
- The retail trade sector and accommodations & food services accounts for most of the remaining growth.

Exhibit 6: Taxable Retail Sales, City of Dupont, 2005 through 2021
Source: Washington State Department of Revenue.



3. Tax and Service Allocations

Tax Revenues

The tax analysis computes an estimated tax using the following methods applicable for a 2022 analysis year.

Property Taxes

Property tax revenues are estimated using the parcel list of the project and their 2022 certified taxable assessed values (for 2023 property taxes). The assessed values are then multiplied by the tax rate for the city's regular levy and EMS levy. Based on this summary, the project currently generates $58,000 in property taxes ($40,000 for the regular levy and $17,600 for the EMS levy).

Exhibit 7: Summary of Assessed Value and Levy Estimates
Source: Pierce County Assessor, 2022.

	Assessed Total	Taxable Total	Tax Rate (2023 taxes)	City Regular Levy	City EMS Levy	City Total
South Lease Area	$3,142,100	$3,142,100	$1.14924	$2,515	$1,096	$3,611
Existing Mine Lease Area	$5,845,200	$5,845,200	$1.14924	$4,679	$2,039	$6,718
Processing Area	$39,406,900	$39,406,900	$1.14924	$31,544	$13,743	$45,288
North Area	$2,075,700	$2,075,700	$1.14924	$1,662	$724	$2,385
Total	$50,469,900	$50,469,900		$40,400	$17,602	$58,002

The property also pays property taxes for personal property. Personal property includes machinery, equipment, furniture, and supplies of businesses and farmers. It also includes any improvements made to land leased from the government (leasehold improvements). The project applicant provided an estimate of their valued personal property.

Exhibit 8: Summary of Personal Property Value and Levy Estimates
Source: CalPortland, 2022.

	Personal Property Assessed Total	Personal Property Taxable Total	Tax Rate (2023 taxes)	City Regular Levy	City EMS Levy	City Total
Personal Property	$13,300,000	$13,300,000	$1.14924	$2,515	$1,096	$3,611

Personal property taxes are estimated to generate $3,600 in taxes in 2022.

Sales & Use Taxes

Of the 9.4% sales tax currently collected in the city on general retail purchases, a 1% "local" share of the tax accrues to local jurisdictions. The city receives 85% of the 1% local tax and Pierce County gets 15%. The current rate accruing to the city is 0.85. Sales tax collected at the site can vary substantially from year to year depending on level of purchases. For example, CalPortland may purchase a new Caterpillar 992 loader (the largest wheel loader that Caterpillar makes) is scheduled in the 2023 year and will substantially impact local sales tax revenue from the mine due to its location of delivery within the city's taxing boundaries. It also makes annual capital

improvements at the site that would be taxable construction expenditures. Likewise, sales tax revenue from customers making retail purchases at the site can also vary depending on the size of projects locally. CalPortland estimates that in a typical year the following taxable retail sales are made:

- Capital purchases: $100,000 - $300,000.
- Customer purchases: $10,000 - $30,000.

The analysis uses the mid-point for these categories: capital purchases: $200,000 and customer purchases: $20,000. Using these values produces a sales tax estimate of $1,870 in 2022.

Exhibit 9: Sales Tax Estimates
Source: CalPortland and ECONorthwest calculations, 2022.

	Estimated Taxable Retail Sales	City Sales Tax Rate	Estimated City Tax Due
Taxable Retail Sales	$220,000	0.0085	$1,870

Business and Occupation Taxes

This category of revenue includes monies received from business and occupation taxes on general business activities. The B&O tax rate in DuPont is 0.1%. CalPortland estimates from its B&O tax filing that in a typical year it reports a local gross receipt of $40,000,000. Using these values produces a B&O tax estimate of $75,690 in 2022.

Exhibit 10: B&O Tax Estimates
Source: CalPortland and ECONorthwest calculations, 2022.

	Estimated Gross Business Income	City B&O Tax Rate	Estimated City Tax Due
City B&O Tax Contribution	$40,000,000	0.0010	$40,000

Utility Taxes

The city levies a business and occupation tax on utilities; however, this tax is passed on to users of the utilities as part of their bills – in this case, payable by CalPortland. The city levies the following rates to the gross receipts of the utility providers:

- Electricity: 6%
- Water: 12%
- Sewer: 6%
- Stormwater: 10%
- Telephone: 6%
- Natural Gas: 6%
- Solid Waste: 8%

CalPortland estimates from its previous spending that the following purchased are made in a typical year:

- Cell Phone: $7,200
- Phone: $10,500
- Electricity: $1,130,000
- Water: $46,000
- Sewer (private): $1,240
- Solid Waste: $15,500

Using these values produces a utility tax estimate of $75,690 in 2022.

Exhibit 11: Utility Tax Estimates
Source: CalPortland and ECONorthwest calculations, 2022.

	Estimated Utility Purchases	City Utility Tax Rate	Estimated City Tax Due
Water	$46,000	12%	$5,520
Sewer	$1,240	6%	$70
Electricity	$1,130,000	6%	$67,800
Solid Waste	$15,500	8%	$1,240
Phone	$17,700	6%	$1,060
Total	$1,210,440		$75,690

Summary of Taxes Generated

The exhibit below summarizes the taxes generated by the mine in 2022. The analysis estimates that the mine generated $180,000 in taxes to the city. This figure represents 2.4% of the city's overall collections of these taxes.

Exhibit 12: Summary Tax Estimates
Source: CalPortland and ECONorthwest calculations, 2022.

Tax	Tax Estimate
Property Tax	$61,613
Sales Tax	$1,870
B&O Tax	$40,000
Utility Tax	$75,690
Total	$179,173

Public Services

Cost Allocation Approach

Public agencies do not typically allocate the costs of their general services (e.g., those supported by general taxes) to individual or classes of taxpayers. These services are all differentially consumed not just between different classes of taxpayers, but are also consumed by non-taxpayers as well (such as a visitor requiring public safety services). However, all taxpayers derived at least some indirect benefit in the form of things like crime deterrence, economic stability, and quality life that accrue a very local, city-specific level.

Given this complex issue, this analysis uses two different approaches to assign some cost "responsibility" to CalPortland's operations to provide some context on this challenging issue. The first approach reasons that residents and businesses derive roughly equal value from city services regardless of how much they may use those services. The second approach uses more specific data proxies to estimate an amount public service use.

The average value approach to estimating a cost allocation to the mine uses the 2022 DuPont Adopted Budget costs divided by number of people and covered employees in the city. The rationale for this approach, while not perfect, provides a simple measure of constituent demand for services, namely that the main recipients of a city's public services (those that are in the general fund) are its resident population and employees of its businesses.

However, this approach may overstate public service demand and costs associated with non-residential development/employees relative to residential land uses. To the extent that service demand and costs related to non-residential development generally or to mining operations specifically are overstated, the projected fiscal surplus to the City could be increased. The analysis uses the 2022 estimated population by the state's Office of Financial Management (10,180 people) and the Puget Sound Regional Council's estimate of covered employment in the city for 2021(5,123). Combined, a population-employment factor of 15,303 is used for this analysis.

The second approach uses more specific data in two key service areas where data is available. The city has been able to provide data on police calls for service near the mine as well as heavy vehicle traffic on the roads.

The cost allocation of approach for the Police Department creates a cost-per-call for service metric by tabulating the average number of calls for service over the five-year time period (2016-2021) across the city. This metric is then applied to calls for service within a police service area that includes the mine.

The cost allocation approach for Street Maintenance portion of the Public Works department is allocated differently. It assumes that 90% (accounting for the pavement related costs) are attributable to vehicle traffic and almost all the roadway wear and tear is attributable to heavy

vehicles. The cost allocation of the Street Maintenance uses roadway counts for heavy vehicles and apportions them based on average daily trips from CalPortland of heavy vehicles.

Cost Allocation Metrics

Using this cost allocation metrics, the following cost per population-employee and cost per use (for police and public works) is derived. This is done by dividing the budget item by 15,303, the population-employment factor for those elements. For police and public works, they are derived on a calls for service basis for police and heavy vehicle trips for streets.

Exhibit 13: Cost Allocation for City of Dupont Public Services
Source: City of Dupont and ECONorthwest calculations

	2022 Adopted Budget	Cost Allocations Per Population-Employee	Cost Allocations Per Use (Police and Public Works)
Mayor/Council	$140,214	$9	$9
Executive	$211,051	$14	$14
City Clerk	$248,611	$16	$16
Human Resources	$274,481	$18	$18
Legal	$129,722	$8	$8
Finance	$303,941	$20	$20
Central Services	$47,900	$3	$3
Information Technology	$80,860	$5	$5
Police Department	$2,643,834	$173	$407
Fire Department	$2,300,405	$150	$150
Community Development	$904,241	$59	$59
Parks, Facilities, and Greenways	$1,104,844	$72	$72
Public Works - Streets*	$616,992	$40	$544

Note: * Streets are allocated on heavy vehicle basis. Police are allocated on calls for sevice.

Cost Allocation to the Mine

Based on the analysis contained in the Traffic Impact Assessment conducted by Heffron Transportation for Pioneer Aggregates, it is noted that 2013 FEIS estimates that a typical day would have 126 employee commute trips (assumed in this analysis to be 63 employees making inbound and outbound trips to the site). Given that this analysis was done in 2013, employee numbers have been estimated at 80 in 2022 for this report. This figure represents 0.5% of the city's overall costs in these areas.

The exhibit below summarizes the cost allocation to mine using the two different methods. The Overall, the average cost approach allocates a smaller cost to the mine than the use approach. However, while the police cost under the use approach allocates a smaller amount than the

average approach, the use approach allocates a relatively larger amount to streets than the average approach.

Exhibit 14: Cost Allocation to Mine – Average and Cost Approach
Source: ECONorthwest, 2022.

	Average Approach	Use Approach
Mayor/Council	$700	$700
Executive	$1,100	$1,100
City Clerk	$1,300	$1,300
Human Resources	$1,400	$1,400
Legal	$700	$700
Finance	$1,600	$1,600
Central Services	$300	$300
Information Technology	$400	$400
Police Department	$13,800	$2,200
Fire Department	$12,000	$12,000
Community Development	$4,700	$4,700
Parks, Facilities, and Greenways	$5,800	$5,800
Public Works - Streets	$9,500	$128,400
Total	$53,300	$160,600

Tax and Cost Allocation Balance

The exhibit below compares tax revenues against public service costs. Based on this analysis, in 2022 revenues generated outpace costs and generate an annual surplus in the range of $18,400 to $125,700. These surpluses represent a cross subsidy to other taxpayers, which by itself, is not an atypical result when looking at narrow land uses. While the methods used in this analysis represents a reasonable approach to conducting the analysis given the information available, some caution should be warranted in consuming the information.

First, it is a single year and taxes and costs can vary from year to year – a surplus in a single year (here, 2022) does not guarantee a surplus in another year when taxes or costs might be different. Second, different measures to allocate costs might produce different cost allocations to the mine. Ultimately, the information provided in this report shed light on the nature of taxation and public services in the city of Dupont and how the specific conditions at the mine contribute to the city's fiscal bottom line.

Exhibit 15: Annual Surplus/Deficit
Source: ECONW calculations, 2022.

	Estimate	Estimate
Taxes Generated	$179,000	$179,000
Allocated Costs	$53,300	$160,600
Surplus/Deficit	$125,700	$18,400

Fiscal Impact under the No Action Alternative

The No Action Alternative assumes no mining on the South Parcel within the context of existing conditions. In this case, the short-term fiscal effects would be similar to those discussed in this analysis since there would be no change in operations and the output of the facility. However, over the longer-term the fiscal effects downstream of mining output limits on the site would be hard to gauge. On the cost side, less mining output would likely impact the largest cost driver to the city (i.e., less wear and tear on city operated streets) but it would also likely impact city revenues as sales taxes, utility taxes, and B&O taxes would decline.

The No Action Alternative also includes a scenario where the site may be developed under existing zoning. Generally, it is understood that zoning of the site could allow approximately 75% Manufacturing/Research Park and approximately 25% Single-Family Residential. The fiscal impact in this scenario will be different than the continued operation of the mine in a couple respects. Regardless, the longer-term downstream fiscal effects of this development would be hard to gauge without a specific proposal. On the revenue side, both manufacturing/research and residential uses represent a more intense use of the land that would lead to more property, sales, and utility, and other taxes on a per square foot basis. However, on the cost side these uses also generate more needs for public services such as public safety services for residential uses and public works needs to support manufacturing uses.

Required Approvals and/or Permits

Preliminary analysis indicates that the following approvals and/or permits may be required from agencies with jurisdiction[1] for continued mining. Additional permits/approvals may be required. Note that mining permits will not be legally effective unless and until permits for the Restoration Plan are issued.

State of Washington

- Dept. of Natural Resources - Reclamation Permit, Forest Practices Permit.
- Dept. of Ecology - NPDES, Administrative Order for Wetland Impacts.

City of DuPont

- Community Development – Site Plan Review, Tree Modification, Critical Areas Permit, Site Development Permit (including Grading Permit), Building Permit, Determination of Transportation Concurrency.
- Public Works – Site Work (Civil Work) Review and Storm Drainage Facilities Review.

EIS Authors and Principal Contributors

EA Engineering, Science and Technology, Inc., PBC

- EIS Project Manager, Primary Author: Project Description, Land Use, Peer Review Aesthetics and Air Quality.

DE Sherrard & Associates

- Surface Water & Groundwater Lead.

Aspect Consulting

- Surface Water, Groundwater, Earth.

Anchor QEA

- Trees, Critical Areas, Wetlands, Floodplain, Parking.

[1] An agency with jurisdiction is "an agency with authority to approve, veto or finance all or part of a nonexempt proposal (or part of a proposal)" (WAC 197-11-714(3)). Typically, this refers to a local, state or federal agency with licensing or permitting approval responsibility concerning a project.

This should be:
Surface Mine Reclamation Permit

- Continue to meet the Puget Sound regional demand for high-quality aggregates from designated mineral resource lands, including the existing mine and the South Parcel site in DuPont, using existing processing and transport facilities, and to achieve consistency with the terms of the 2011 Settlement Agreement.

- Expand mining horizontally into approximately 188 acres previously undisturbed by mining (including South Parcel), and vertical expansion of the depth of mining on approximately 125 acres where re-mining will deepen a portion of the Existing Mine to:
    - Fully utilize the site's high-quality reserves of sand and gravel that exists below the current permitted depth on the Existing Mine and under the surface of the South Parcel.
    - Extend the useful life of the existing processing and transport facilities by providing a reliably supply of quality aggregates for processing and transport.
    - Continue to provide the quality product mix to the sand and gravel market.

- Maintain barge export of the majority of mined aggregate materials to continue to limit the amount of export by truck and to maximize the environmental and other benefits associated with marine transport.

- Carry out a mine plan for the site that minimizes environmental impacts associated with mining activity, adheres to state and local regulations, and maximizes the economic value of the site;

- Ultimately, reclaim the site, including regrading, replacement of topsoil, and revegetation.

- Implement applicable provisions of the 2011 Settlement Agreement

Description of the Proposed Actions

To implement the Applicants Objectives for the site, the Proposed Actions for the Pioneer Aggregates South Parcel Project includes the following reviews and approvals:

- City of DuPont Community Development – Site Plan Review, Tree Modification Review, Critical Areas Permit, Determination of Transportation Concurrency.

- Washington State Dept. of Natural Resources - Reclamation Permit, and Forest Practices Permit.

2 EA

The need for additional permits or approvals could be identified during the project review process.

The symbols for the Olympia Beds (Qob) and the Pre-Olympia Non-glacial Deposits (Qpon) used in the legend does not match what is shown on the cross section above.

The dewatering and grading associated with the Proposed Action would reduce groundwater flow toward the steep slopes of Sequalitchew Creek ravine along the east portion of the Expansion Area onsite. The Proposed Action would also route groundwater that would potentially flow toward the creek instead toward the mined areas. Ultimately, this is anticipated to reduce the potential for landslides and slope failures within the Sequalitchew Creek ravine. The seeps and springs identified on **Figure 3.1-3** are expected to be reduced or dewatered in their entirety, which may reduce the level of landslide hazard susceptibility within the ravine (see Section 3.3, **Surface Water** and Section 3.4, **Groundwater**, for details on groundwater and surface water flow).

Slope Stability

A geotechnical analysis (Aspect 2021) evaluated the stability of the proposed cut slopes of the South Parcel Project during mining operations is. The analysis showed acceptable factor of safety values (that exceed 1.5 static and 1.1 for seismic conditions) for slope stability for the mined condition within the site area and the adjacent Sequalitchew Creek ravine (see **Appendix B** for detail).

4 EA

Under a post-mining reclamation plan approved by the DNR, the mine slopes would be progressively reclaimed over the life of the Proposed Action. Mine slopes would be graded to 3H:1V or flatter where groundwater seepage is expected (i.e., on the eastern and southern slopes of the Expansion Area portion of the site) once the slope is no longer being mined. Slopes where groundwater is not anticipated to be present, such as along the southern boundary of the Re-Mine Area portion of the site, would be graded to 2H:1V.

Backfill is not required to achieve the reclaimed configuration; however, backfill may be used to enhance reclamation, as has been done elsewhere within the Existing Mine, to improve vegetation performance. The backfill would consist of retained finer material from the Expansion Area and imported clean fill. The proposed slope angles are flatter than the natural angle of repose of the remaining original soils and would provide the long-term erosion control and landscape base for planting. After establishment of vegetation, any long-term slope stability impact to earth-related features is expected to be low. The already high stability of newly created slopes would generally increase with the establishment of vegetation.

Erosion Potential

Due to their generally coarse-grained nature and good infiltration characteristics, the soils in the site area possess a low erosion risk and are generally not moisture sensitive. The erosion potential is increased by the removal of vegetation and construction of mine slopes; however, with proper storm water management techniques in place, these conditions are not anticipated to result in significant erosion of the coarse soils. The primary element of

Number: 1 Author: ndam490 Subject: Highlight Date: 7/11/2024 11:30:12 AM
It appears that this sentence was cut short.

be used in reclamation. If the sample results indicate the topsoil contains arsenic in concentrations equal to or greater than 20 ppm, then clean soil would be mixed with the topsoil to reduce the arsenic concentration. Stockpiled topsoil would not be used for reclamation until sample results confirm the concentrations of arsenic and lead meet cleanup criteria.

5
Cal

Geologically Hazardous Areas

The impacts of the Proposed Action relative to landslide and steep slope hazards, and seismic hazards and liquefaction hazards are discussed below (also see **Figure 3.1-5)**. The identified Geologically Hazardous Areas are shown in **Figure 3.1-5** encircled with a bold black line. **Figure 3.1-5** also includes shading to indicate slope angles; shaded areas are not necessarily Geologically Hazardous Areas.

Landslide and Steep Slope Hazardous Areas

Landslide and steep slope hazards are not present within the site area but are present nearby in the Sequalitchew Creek ravine. The proposed mined slopes would be contoured to drain away from the ravine as shown on **Figure 3.1-5**. The slope stability analysis (see **Appendix B**) determined acceptable factor-of-safety values (greater than 1.5) for each of the profiles in the Expansion Area and Re-Mine Area portions of the site, as shown on **Figure 3.1-4**. Thus, the mined slopes would not be considered landslide or steep slope hazards.

Mining under the Proposed Action would locally reduce seeps and springs that have been observed in the Sequalitchew Creek ravine, as shown on **Figure 3.1-3**, resulting in an improvement in slope stability (see Section 3.5, **Plants and Animals**, for discussion on wetland habitat conditions). The Sequalitchew Creek ravine slope would also have an acceptable Factor of Safety greater than 1.5, as shown on **Figure 3.1-4**.

The hazard mitigations listed in Section 3.1.3, Mitigation Measures are intended to protect landslide and steep slope hazards located outside of, but nearby, the site area.

Erosion Hazardous Areas

The channel migration zone within the Sequalitchew Creek ravine, which is defined as an erosion hazard area, is not anticipated to be impacted by the Proposed Action. The flows from ravine springs would be reduced by the proposed dewatering process which would reduce the potential for channel migration and its associated potential for erosion. Therefore, no significant adverse impacts are anticipated to erosion hazards from the Proposed Action at the site or in adjacent areas.

Number: 1 Author: ndam490 Subject: Highlight Date: 7/10/2024 11:54:04 AM
What would happen if the topsoil contains lead that exceeds the Ecology cleanup level?

3.1.3 Mitigation Measures

The following mitigation measures have been included in the Proposed Action to reduce impacts on slope stability and erosion (see Section 3.3, **Groundwater**, and Section 3.4, **Surface Water**, for additional discussion and mitigation measures related to surface water and groundwater):

Proposed Mitigation Measures

- A reclamation plan would be prepared and implemented in accordance with the Surface Mining Act (RCW 78.44). The reclamation plan would be submitted to DNR for review and approval prior to mining. Prior review by the City is also required as part of that process.

- Mining would occur in segments; no mass clearing of the Expansion Area portion of the site would occur.

- An erosion and sediment control plan would be prepared and implemented in accordance with the requirements of the City of DuPont Municipal Code (DMC 22.01.180) and the NPDES Sand and Gravel General Permit. Erosion control features would include storm water drainage into the interior of the mine and onsite storm water disposal.

- A vegetated buffer would be maintained between the proposed mine area and the top of steep slopes in accordance with the City of DuPont's Sensitive Areas Code [DMC 25.105.070(2)].

- A 100-foot setback would be maintained from the top of slopes greater than 40% within the Sequalitchew Creek ravine, consistent with the conditions for the existing mine and the 1994 and 2012 Settlement Agreements.

- Earthwork for excavation and reclamation would be in accordance with the federal and state statutes of the Mine Safety and Health Act and the Surface Mining Act.

- Topsoil would be stockpiled and used for reclamation of mined areas. Consistent with the approved Reclamation Plan, Cleanup Action Plan developed for the South Parcel Project and published Ecology guidance, samples would be collected from stockpiled topsoil to confirm arsenic concentrations meet Ecology standards.

6
Cal

- After application of the topsoil, slopes would be re-vegetated by planting with trees and grass. When reclamation is complete, heavy equipment would generally not operate on the reclaimed slopes except for construction or maintenance of pedestrian paths, access roads, utilities, or other permitted facilities.

(the conservative cleanup level established by Ecology for the TSP) or lead in concentrations exceeding 250 ppm, then the topsoil would be used in reclamation. If the sample results indicate the topsoil contains arsenic in concentrations equal to or greater than 20 ppm, then clean soil would be mixed with the topsoil to reduce the arsenic concentration. Stockpiled topsoil would not be used for reclamation until sample results confirm the concentrations of arsenic and lead meet cleanup criteria.

8
Cal

2.2.6 Effects on Geologically Hazardous Areas

The effects of the Proposed Action relative to landslide and steep slope hazards, seismic hazards and liquefaction hazards are presented below and as shown on Figure 10. Additional discussion is provided in the Geotechnical Engineering Report (Aspect, 2021a).

2.2.6.1 Landslide and Steep Slope Hazards

Landslide and Steep Slope hazards are not present within the South Parcel Project area but are present nearby in the Sequalitchew Creek ravine. The mined slopes have been designed by a geotechnical engineer and are contoured to drain away from the ravine as shown on Figure 10. The slope stability analysis shows acceptable factor-of-safety values (greater than 1.5) for each of the profiles in the Expansion Area and Re-Mine Area as shown on Figure 11. Thus, the mined slopes will not be Landslide or Steep Slope Hazards.

The Proposed Action locally reduce the expression of seeps and springs that have been observed in the ravine as shown on Figure 9, resulting in an improvement in slope stability. The Sequalitchew Creek ravine slope would also have an FOS greater than 1.5 as shown on Figure 11.

The hazard mitigation recommendations listed below in Section 2.4 are intended to protect landslide and steep slope hazards located outside of, but nearby, the South Parcel Project area.

2.2.6.2 Erosion Hazards

DMC 25.105.050 (3) defines erosion hazards as including coastal erosion zones and channel migration zones (areas along a river or stream where the channel can be reasonably predicted to migrate over time) and coastal erosion zones. Coastal erosion zones are not relevant to the Proposed Action.

The channel migration zone within the Sequalitchew Creek ravine will not be impacted by the Proposed Action. The flows from ravine springs will be reduced by the dewatering process, which will reduce the potential for channel migration.

No adverse impacts are anticipated to erosion hazards from the Proposed Action at the South Parcel or adjacent areas.

2.2.6.3 Seismic Hazards

No adverse impacts are anticipated to seismic hazards from the Proposed Action at the South Parcel or adjacent areas. The slope stability analysis for seismic condition shows acceptable factor-of-safety values (greater than 1.1) for each of the profiles in the Expansion Area, Re-Mine Area, and Sequalitchew Creek ravine.

Number: 1 Author: ndam490 Subject: Highlight Date: 7/11/2024 8:57:41 AM
What would happen if the topsoil contains lead that exceeds the Ecology cleanup level?

2012), samples would be collected from stockpiled topsoil to confirm arsenic concentrations meet Ecology standards.

9 Cal

- After application of the topsoil, slopes would be revegetated by planting with trees and grass. When reclamation is complete, heavy equipment would generally not operate on the reclaimed slopes except for construction or maintenance of pedestrian paths, access roads, utilities, or other permitted facilities.
- The South Parcel would be cleared in segments corresponding to the mining plan.
- Internal drainage would be maintained during mining.
- Mine slopes would be track-walked to tamp soils and create surface roughness to encourage infiltration of stormwater on the slope.
- Mine slopes would be reclaimed with soil amendments and vegetation according to the DNR-approved Reclamation Plan.
- The existing wheel wash would continue to be used and maintained for vehicles exiting the mine.
- Settling ponds would be constructed upstream of the infiltration ponds.
- Mine slopes would be periodically inspected and repaired or revegetated to reduce erosion or improve surface stability.

2.5 Cumulative Impacts of Proposed Action and Restoration Plan

Cumulative impacts of the Proposed Action and Restoration Plan are described below.

The Proposed Action will reduce the potential for groundwater seepage and spring flow from the northern slope of the Sequalitchew Creek ravine. This will effectively reduce the potential for slope instability within the Sequalitchew Creek ravine.

Following implementation of the Restoration Plan, we anticipate higher streamflows in the Sequalitchew Creek ravine that could locally impact channel bank stability. This represents the return of channel-forming flows to Sequalitchew Creek and is a desired outcome of implementation of the Restoration Plan.

The return of higher flows is not anticipated to result in instability of the ravine side slopes because the restored flows would be similar to the flows present historically that did not impact global ravine stability. Similar flows were historically present during periods of land use disturbance in the ravine (e.g., during the period of railroad grade construction and initial logging of the ravine slope) and did not result in large-scale slope instability.

Dear Barb Kincaid:

Thank you for the opportunity to comment on the draft environmental impact statement for the Pioneer Aggregates South Parcel Mine Expansion Project (SEPA 2021-002) as proposed by Glacier Northwest, Inc, dba CalPortland. The Department of Ecology (Ecology) reviewed the environmental checklist and has the following comment(s):

SOLID WASTE MANAGEMENT: John Price (206) 202-5623

1. On page 1-5 the drawdown around the marsh complex is described. The drawdown around JBLM Landfill #5 should also be described. — 1 Cal DS

2. Figures 3.3-6 through 3.3-9 should show JBLM landfill #5 as a feature so that the drawdown at the landfill can be seen — 2 Cal DS

3. The description of Groundwater Quality on page 3.3-12 states that "The most recent groundwater quality data reviewed from the site [JBLM LF #5] is from 2010" — 3 Cal DS

the text should be updated with reference to more recent groundwater quality data at the landfill (the 2022 annual monitoring report is available);

the 2023 report is not yet available but two 2023 semi-annual reports are available. — 4 Cal DS

SOLID WASTE MANAGEMENT: Derek Rockett (360) 995-3176

All grading and filling of land must utilize only clean fill. All other materials may be considered solid waste and permit approval may be required from your local jurisdictional health department prior to filling. All removed debris resulting from this project must be disposed of at an approved site. Contact the local jurisdictional health department or Department of Ecology for proper management of these materials. — 5 Cal EA

TOXICS CLEANUP/TACOMA SMELTER PLUME: Diana Ison (360) 999-9593

This proposed project is located in an area that has been contaminated with heavy metals due to the air emissions originating from the old Asarco smelter in North Tacoma. Glacier

Northwest (Glacier) prepared a Cleanup Action Plan (CAP) to remediate the contaminated soils within the South Parcel as part of the ongoing mining. Glacier joined Ecology's Voluntary Cleanup Program (VCP) as VCP No. SW1728 and requested an opinion on the proposed cleanup. Ecology reviewed the CAP and agreed with the plan. Ecology issued an opinion in February 2021. Glacier will sample and remediate the soils if they test above the Model Toxics Control Act cleanup levels for arsenic or lead. They will sample and remediate the soil in stages corresponding to the mining schedule. Glacier will continue to sample and remediate the soil until the mining is complete. At the end of the mining operations, Glacier will prepare and submit to Ecology a final cleanup report and apply for a No Further Action determination from Ecology. For questions regarding this VCP project, please contact Diana Ison with the Toxic Cleanup Program at (360) 999-9593 or via email at diana.ison@ecy.wa.gov.

6 Cal EA

TOXICS CLEANUP: John Fot (564) 233-5588

Inadequate discussion with regards to the potential impacts for the industrial park and JBLM Landfill 5 to the Northeast. Dewatering may cause additional settling affecting foundations and landfill liners. Dewatering will mobilize any potential landfill leachate/contamination and direct it toward the mine site.

7 Cal EA

TOXICS CLEANUP: Sandy Smith (360) 999-9588

The Pioneer Aggregates South Parcel Mine Expansion area includes and is within a quarter mile of several known or suspected contaminated sites. To search and access information concerning these sites see https://ecology.wa.gov/Spills-Cleanup/Contamination-cleanup/Cleanup-sites. The cleanup of these toxic cleanup sites is regulated under the Washington Model Toxics Control Act (MTCA), Chapter 70A.305 RCW, and implementing regulations contained in Chapter 173-340 WAC. Ecology recommends that pollution in the environment, if present within the Pioneer Aggregates South Parcel Mine Expansion area, be cleaned up in compliance with WAC 173-340 before construction or redevelopment and while contaminated soil and/or groundwater, if present, are more accessible.

If contamination is suspected, discovered, or occurs during development of the area, testing of the potentially contaminated media must be conducted. If contamination of soil or groundwater is readily apparent, or is revealed by testing, the Department of Ecology must be notified. Contact the Environmental Report Tracking System Coordinator at the Southwest Regional Office at (360) 407-6300. For assistance and information about subsequent cleanup and to identify the type of testing that will be required, contact Sandy Smith with the Toxics Cleanup Program at the Southwest Regional Office at (360) 999-9588.

8 Cal EA

WATER RESOURCES: Charlotte Lattimore (360) 407-6066

Under RCW 90.03.350, a Dam Safety construction permit is required for those dams or ponds that can impound a volume of 10 acre-feet or more of water or other liquids above ground level. This also includes ponds that share a common berm which in combination the volume is 10 acre-feet or more. The Pioneer Aggregates South Parcel Mine Expansion project references the construction of retention/detention ponds, if these impoundments meet or exceeds the above referenced criteria, you will need to apply for a dam construction permit. To determine if a Dam Safety construction permit is required for your project, the applicant must submit a set of construction plans to:
WA Department of Ecology

9 Cal City

Dam Safety Office
P.O. Box 47600
Olympia, WA 98504-7600

The construction permit application can be found by entering the following link into your search engine:
https://apps.ecology.wa.gov/publications/summarypages/ecy07038.html

9 cont

For additional information, please contact Charlotte Lattimore by e-mail at clat461@ecy.wa.gov or by telephone at (360) 407-6066.

WATER QUALITY/INDUSTRIAL OPERATIONS UNIT:
Eli Newby, Sand & Gravel Permit Manager
(360) 763-2633 | eil.newby@ecy.wa.gov

Pioneer Aggregates (WAG501178) currently has Sand and Gravel General Permit (NPDES) coverage issued for the 508.5-acre existing operation for a discharge to groundwater. Permitted existing facilities planning a significant process change must submit a complete and accurate Notice of Intent (NOI) no less than one hundred and eighty (180) days before the significant process change.

10 Cal

The proposed 188-acre expansion includes installation of wells to intercept and pump groundwater to dry out gravels for mining. The proposal states intercepted groundwater would be conveyed by surface channels and infiltrated in ponds on the floor of the Existing Mine. Pumping groundwater for mining meets the permit definition for a discharge of Mine Dewatering Water and will require a modification of permit coverage. Modification of existing monitoring locations or the addition of new monitoring points will be required for Mine Dewater Water to maintain compliance with permit conditions for representative sampling.

11 Cal

The Site Management Plan, Site Map, Monitoring Plan including quarterly Discharge Mentoring Reporting monitoring points must be updated as necessary to respond to changes in facility and site conditions.

12 Cal

Permitted existing facilities planning a significant process change must satisfy public notice requirements for the Ecology permit action as a part of the NOI application for modified permit coverage. Additional information can be found in in WAC 173-226-130(5) and WAC 173-220-150(1)(b).

13 Cal

Ecology's comments are based upon information provided by the lead agency. As such, they may not constitute an exhaustive list of the various authorizations that must be obtained or legal requirements that must be fulfilled in order to carry out the proposed action.

If you have any questions or would like to respond to these comments, please contact the appropriate reviewing staff listed above.

Re: Pioneer Aggregates South Parcel Project DEIS

We've received a copy of the Draft Environmental Impact Statement (DEIS) prepared by the City of DuPont as the lead agency for review of the proposed Pioneer Aggregates South Parcel Project under the provisions of Revised Code of Washington (RCW) 43.21C, the State Environmental Policy Act (SEPA). This proposed project lies within the traditional territories of the Nisqually Tribe, which is governed by the Nisqually Tribal Council. The Nisqually Tribal Council has delegated to the Nisqually Tribal Historic Preservation Officer (THPO) the responsibility of representing the Tribe with regard to cultural resources management issues throughout our traditional territories under Nisqually Tribal Council Resolutions 26-2014 and 17-2024.

The Nisqually THPO is submitting the following comments pertaining to the adequacy of identification efforts regarding cultural resources of significance to the Nisqually Tribe potentially affected by the proposed project, and the analysis of potential impacts to these resources, as currently reflected in the DEIS and its appendices. Please note that other Nisqually tribal programs may submit comments on the DEIS based on their own areas of expertise.

We first offer that, as a sovereign nation, rather than members of the general public, we respectfully encourage our governmental partners to provide opportunities for consultation and review under SEPA that acknowledge that distinction, rather than requesting tribal review via the public comment process. We nevertheless offer our comments on the DEIS at this time in order to better ensure that the final EIS both accounts for, and adequately analyzes potential effects on, the full range of cultural resources potentially impacted by the proposed mining of the South Parcel, the associated dewatering of the Vashon Aquifer, and the remediation of mining activities via the "restoration" of Sequalitchew Creek as represented in the analysis of cumulative impacts contained within the South Parcel DEIS.

1
City
EA

This proposed project is located within a landscape of deep and enduring significance to the Nisqually Tribe and our members. Inclusive of saltwater, shorelands and tidelands, forested uplands, glacial outwash prairies, and a vast, interconnected system of fragile glacially-created wetlands and kettle lakes, this landscape has sustained the Nisqually people for countless generations; a time depth of which the current archaeological record provides only the smallest glimpse. Through living within and actively managing this landscape since time immemorial, our

2
EA
Cal

people have left their legacy as represented within the pre contact and historic era archaeological sites and non-archaeological places of enduring historical, cultural, and spiritual significance encompassed therein. These cultural resources are the very reasons that the late Hereditary Chief, Leonard Squally, devoted the closing years of his life to trying to protect the places central to Nisqually tribal identity and well-being that constitute the ancestral village landscape of Sequalitchew, within which the City of DuPont is located.

2 cont

The cultural resource review and analysis contained within the DEIS is wholly inadequate to the representation of the history and significance of cultural resources potentially impacted by the proposed South Parcel Project. The inadequacy of this review and analysis is due to its improperly limited geographic scope, its methodological unsuitability and associated topically limited content, and the culturally uninformed identification efforts, analyses, and recommendations it contains. The cultural resource review and analysis undertaken to inform the DEIS fails to provide the City of DuPont with adequate information to "ensure that presently unquantified environmental amenities and values will be given appropriate consideration in decision making," as SEPA's mandates demand (RCW 43.21C.030). As currently written, the DEIS neither reflects a reasonable and good faith effort to identify all cultural resources potentially affected by this proposed project, nor offers adequate analysis of the Project's potential effects on those resources. We offer the following comments in support of that statement:

3 Cal

Geographic Scope

- The contractors who prepared the *Pioneer Aggregates South Parcel Project Cultural Resources Desktop Analysis* and its associated appendices included within the DEIS defined what they term as the "area of direct impacts (ADI)" for the proposed project within which they undertook their cultural resource identification and analysis efforts. The term "area of direct impacts" has no regulatory meaning within the context of SEPA. The geographic area that is to be analyzed during SEPA review is the "affected area" of the project, as required under the SEPA Rules at WAC 197-11-430(e). The delineation of the affected area of a proposed project under SEPA does not in any way distinguish between "direct" and "indirect" impacts. We offer a proposed boundary for the affected area of this project below.

4 Cal

- With further regard to the analysis of "direct" impacts, the contractors seem to be equating the term "direct" with "ground disturbance," thereby inherently delimiting both the number and types of cultural resources, and the range of cultural resource impacts, under analysis. Rather than being defined within SEPA, the term "direct effects" as commonly used within cultural resource identification and analysis efforts is derived from the National Historic Preservation Act of 1966 (54 USC 300101 et seq), and its implementing regulations, commonly referred to as the Section 106 process, found at 36 CFR Part 800. As recently clarified by the United States Court of Appeals for the District of Columbia Circuit (*National Parks Conservation Association v. Semonite*, No. 18-5179[D.C. Cir. 2019]), the term "direct effects" refers to the *causality* of the effect, rather than the *physicality* of the effect. The Court determined that *direct effects are those that arise from the same project at the same time and place with no intervening cause, regardless of specific type*. By limiting their review to their unilaterally determined and inadequate "ADI," the contractors have failed to account for all cultural resources within the affected area of the proposed project, as well

5 Cal

as the full range of potential project-related impacts to these resources, as required under SEPA.

5 cont

- The contractors selected a 1/8-mile radius around their "ADI" within which prior cultural resource efforts and previously recorded archaeological and historic-era resources have been briefly considered in their identification and analysis efforts. Please note that Section V.A.1. of the current version of the *Washington State Standards for Cultural Resource Reporting* (March 2023) states that the current knowledge regarding archaeological resources within a one-mile radius of a proposed project location should be presented within cultural resource reporting.

6 Cal

- Due to the improperly limited geographic scope of the contractor's cultural resource review and analysis, the DEIS fails to account for both the presence of all cultural resources potentially affected by the proposed South Parcel Project, and the full array of potential effects of the proposed project on these resources. Please instruct the contractors to identify all cultural resources within the entire *affected area* of the proposed project, a definition of which is proposed below, as well as within a one-mile radius of the affected area of the project. This will help to better ensure that their efforts both meet contemporary cultural resource investigation and reporting standards and provide the City with the data necessary understanding the full range of potential project impacts on all cultural resources of significance to the Nisqually Tribe.

7 Cal

Methodologies

- The contractors performed a "Desktop Analysis," rather than conducting an on the ground survey inclusive of subsurface testing, paired with a standard contemporary ethnographic review inclusive of Traditional Cultural Properties (TCPs). Given the scale and scope of proposed landscape modification associated with the South Parcel Project, a Desktop Analysis such as that undertaken by the contractors simply does not constitute a reasonable and good-faith effort to identify cultural resources potentially affected by the project. A cultural resource "Desktop Analysis" is inherently unsuitable to the parameters of environmental review required within an EIS, given the failure of this approach to provide any insight into the very "*unquantified* environmental amenities and values" that are mandated to be identified and analyzed under SEPA. The methodological inadequacy of this desktop-based effort within the context of the South Parcel Project DEIS is further magnified by the improperly limited geographic scope of the contractor's analysis.

8 Cal

- Being limited solely to the identification and analysis of *previously recorded archaeological resources* within, and within 1/8-mile of, the improperly delineated affected area of the proposed project, the Desktop Analysis produced by the contractors fails to account for both previously *unrecorded archaeological resources* potentially affected by the project, and a vast array of *non-archaeological* places and landscapes of traditional cultural, historical, and spiritual significance to the Nisqually Tribe, that may be impacted by the proposed South Parcel Project.

9 Cal

- The contractor's Desktop Analysis also lacks the depth of ethnographic and ethnohistoric inquiry necessary to the understanding of the existence and variety of cultural resources of

10 Cal

deep and enduring historic, archaeological, cultural, and spiritual significance to the Nisqually Tribe within the affected area of this proposed project. The contractor's failure to adequately consider ethnographic and contemporary cultural data have resulted in their failure to identify all cultural resources potentially affected by the proposed project, and their failure to analyze, or even recognize, the impacts of the project on these resources.

10 cont

Identification and Analysis

- Most contemporary cultural resource professionals are aware of the necessity of taking a landscape approach to the proper identification, and analysis of the significance, of cultural resources significant to affected tribes. Most are also aware that culturally uninformed archaeological research is of extremely limited utility when engaged in the identification of such resources and the evaluation of their eligibility for listing on the NRHP and other historic registers. Because it lacks both landscape-level contextualization and ethnographic research that meets contemporary professional standards and expectations, the identification effort undertaken by the contractor fails to account for all cultural resources potentially affected by the proposed South Parcel Project.

11 Cal

- It is the position of the Nisqually THPO that, given the scale and scope of the proposed project and its potential impacts on cultural resources of significance to the Nisqually Tribe, the affected environment that is to be analyzed under SEPA is the Sequalitchew Ancestral Village Landscape, which is, itself, a Traditional Cultural Property (TCP) eligible for listing on the National Register of Historic Places (NRHP) under all four NRHP Criteria of Evaluation. While not formally mapped at this time, the boundaries of the Sequalitchew Ancestral Village Landscape TCP can be said to largely mirror those of the greater Sequalitchew Creek watershed and its environs. Given the proposed dewatering of the Vashon Aquifer and associated dewatering of vast portions of the watershed itself, the impacts of the proposed project on the NRHP-eligible TCP that is the Sequalitchew Ancestral Village Landscape, and all of the cultural resources of significance to the Nisqually Tribe encompassed within that landscape, must be analyzed in the DEIS.

12 Cal

- The Sequalitchew Ancestral Village Landscape TCP is a single historic property that is itself comprised of numerous historic properties and cultural resources of archaeological historical, cultural, and spiritual significance to the Nisqually Tribe, consisting of both previously recorded and unrecorded pre contact and historic era archaeological and ethnographic sites and landscapes. Among these are seasonal and permanent village sites; resource gathering locations; locations of spiritual and ritual practice and prayer; places associated with important people and events; ancestral burial locations and cemeteries; and locations associated with spiritually powerful and culturally central entities. The failure of the contractors to engage in the level of ethnographic and ethnohistorical research necessary to identifying and analyzing potential impacts to these resources posed by the proposed project renders largely meaningless the consideration of cultural resource impacts within the DEIS.

13 Cal

- The vast majority of the cultural resources contained within the larger Sequalitchew Ancestral Village Landscape TCP are, themselves, NRHP-eligible historic properties, owing to their archaeological and/or traditional cultural significance, as well as simultaneously contributing to the significance of the overarching Sequalitchew Village Ancestral Landscape TCP. Because of the cultural and spiritual teachings and practices, important

14 Cal

people, and historical patterns and events with which it is associated, the significance of the Sequalitchew Ancestral Village Landscape TCP and its constituent archaeological sites, TCPs, and landscapes to contemporary members of the Nisqually Tribe cannot be overstated.

14 cont

- One of the many archaeologically, culturally, and spiritually significant cultural resources at the heart of the Sequalitchew Ancestral Village Landscape TCP that the contractors fail to address as a cultural resource is Sequalitchew Creek, the mouth of which is the subject of an oral tradition known as the "Giant of Sequalitchew," a Nisqually fisherman who use this beach for seine fishing. Sequalitchew Creek is, itself, an NRHP-eligible TCP owing, in part, to its historic spiritual use by practitioners of *Seowin*, the ancient and enduring lifeways of the Nisqually and other Coast Salish people, still vibrant today. The proposed dewatering of the Vashon Aquifer will not just adversely impact, but will irreparably damage, Sequalitchew Creek both as a water resource and as a critically important and spiritually central cultural resource, the cultural and spiritual significance of, and impacts to which, have not been addressed by the contractors.

15 Cal

- As another example, the glacial kettle lakes and interconnected wetlands that will be cleared, eliminated, and/or otherwise impacted by this proposed project are, in fact, cultural resources and, quite likely, NRHP-eligible TCPs, owing to the fact that these types of geophysical locations being integral to a specific ancestral cultural practice central to Coast Salish identity and well-being. Furthermore, a number of these kettle lakes are associated with culturally important non-human beings, rendering them further eligible for listing on the NRHP as TCPs. The kettle lakes and wetlands that will be impacted by the proposed project are cultural resources, yet were not identified as such by the contractors, and the analysis of the cultural and spiritual impacts of their destruction is, therefore, completely absent.

16 Cal

- The proposed gravel removal footprint of the South Parcel Project, specifically the expansion area, encompasses some of the last remaining undeveloped lands within the City's jurisdiction. These lands have significant potential for the restoration of the rare glacial outwash prairie habitat of Sequalitchew that once hosted a wealth of *Camassia quamash*, or blue camas, a food of immeasurable significance and nutritional value to the Nisqually people. These areas were seeded with camas by a culturally central non-human Person and are, therefore, eligible for listing on the NRHP as TCPs. As the contractors failed to undertake adequate ethnographic and ethnohistorical research, they have failed to identify this association which is well-documented in the published ethnographic literature available to them. No consideration has been given by the contractors to those NRHP-eligible TCPs consisting of areas within which plants of traditional cultural significance were long gathered and within which they have the potential to be restored so that they can, once again, fulfill their role as physical, cultural, and spiritual resources for the Nisqually people.

17 Cal

- The contractors attempt to provide an analysis of the cumulative impacts of both the proposed South Parcel Project and the associated Sequalitchew Creek Restoration Plan (Restoration Plan) on cultural resources within their improperly delineated "ADI." Neither a DEIS nor a final EIS analyzing the environmental impacts of the Restoration Place has, in fact, been produced, which renders the consideration of cumulative impacts completely

18 Cal City

meaningless. Both the June 2023 and January 2024 SEPA Environmental Checklists for the Restoration Plan state that there are no cultural resources that will be affected by the implementation of the plan, and that no studies were undertaken to make that determination. The Nisqually THPO therefore has no choice but to conclude that the analysis of cumulative impacts on cultural resources contained within the South Parcel DEIS is completely without scientific value or merit. We further note that project proponents are not permitted to provide the sole word "No" as a response to a SEPA Checklist question, and request that the SEPA Checklist of the Restoration Plan be amended by the proponent in conformity with regulatory requirements.

18 cont

- The dewatering of the Vashon Aquifer to facilitate mining will have expansive and devastating effects on animals that are culturally and spiritually central to the lifeways of the Nisqually people, including our salmon relatives whose habitat is protected by the 1854 Treaty of Medicine Creek alongside our inherent sovereign rights to manage and harvest them. To the Nisqually people, salmon are a cultural resource, and the lack of consideration given in the DEIS to the very real cultural harms posed by the dewatering of an entire aquifer and devastation of environmental elements central to supporting healthy salmon habitat is unconscionable. The many years and countless millions of dollars that have already been spent on salmon habitat restoration activities by the Nisqually Tribe and the State of Washington within the Sequalitchew estuary and the greater Nisqually Basin renders the dewatering of the Vashon Aquifer completely unconscionable. The dewatering of the Vashon Aquifer would, in fact, violate the inherent and treaty-protected sovereign rights of the Nisqually Tribe.

19 Cal

- The exploitation of the Nisqually ancestral homelands by others for financial gain, and the attendant physical destruction of the places and landscapes for which we have been given the ancestral responsibility to care, as well as the duty to stewards for future generations, has devastating effects on the physical, mental, emotional, and spiritual health of contemporary Nisqually tribal members. The disparate impacts of the proposed project on the well-being of the Nisqually Tribe and our members have not been considered. The lack of environmental justice analysis within the DEIS, and the failure to quantify and adequately analyze the land-based traumas and other cultural and spiritual harms to the Nisqually people posed by the potential South Parcel Project is a glaring and unacceptable oversight that must be addressed in the final EIS for the project.

20 Cal EA

- The release of confidential information regarding the existence and location of cultural resources of significance to the Nisqually Tribe in the final appendices to the DEIS is itself a cultural harm that must rectified immediately through the deletion of those portions of the publicly available DEIS, and their omission from the publicly available version of the final EIS when it is released.

21 City EA

Overall, the cultural resource-related portions of the DEIS fail to both satisfy contemporary professional standards for cultural resource practitioners and provide adequate and accurate information related to cultural resource impacts upon which the City of DuPont can make the most fully informed decisions regarding the proposed South Parcel Project. Given the unacceptable shortcomings of the cultural resource identification and analysis undertaken to inform the DEIS, the Nisqually THPO requests extensive revisions, including:

22 Cal EA

- An expansion of the parameters of review to the *entire affected area* of the project as required under SEPA, namely the boundaries of the NRHP-eligible Sequalitchew Ancestral Village Landscape TCP and the numerous cultural resources of which it is comprised;

- The documentation, assessment of the significance of, and robust analysis of the potential impacts of the proposed project on all *archaeological and non-archaeological cultural resources* significant to the Nisqually Tribe within the affected area of the proposed project; and

- An environmental justice analysis of both the *cultural harms, and the impairment of treaty-protected inherent sovereign rights*, to which the members of the Nisqually Tribe would be subjected as a result of the implementation of the South Parcel Project.

22 cont

We genuinely thank you for the thoughtful consideration of our comments and look forward to further consultation to assist the City of DuPont in obtaining the data that it needs in order to make a fully informed decision regarding the project.

Sincerely,

Subject: **For the proposed Pioneer Aggregates South Parcel Project, File No. SEPA 2021-002**

Dear Barb:

Thank you for the opportunity to comment on the City of DuPont EIS (DEIS) for the proposed Pioneer Aggregates South Parcel Project, File No. SEPA 2021-002. Below are Pierce County Sewer Utility comments for your consideration.

Existing Sewers in Powerline Rd. and easements need protection during this work.

- The proposed Noise/Visual Berm is too close to existing sewers and should be set back to avoid overloading the pipeline with a 20-foot berm.
- The proposed grading at the east end of the of the mine appears to impact existing sewers and should be reconsidered.

1 Cal EA

The dewatering plan lower groundwater levels over 60 feet in many areas and will likely lead to settlement. The County requests the following conditions be added to the mine's expansion project:

- CalPortland shall monitor settlement of all existing sewer mains inside the area impacted by the proposed dewatering.
- If settlement creates sags in the sewer system CalPortland must take corrective action to restore the sewer system line and grade.

2 EA City

Bell Marsh Wetland monitoring should be included to make sure water levels stay below the proposed sewer line at the Robinson Trail.

3 City Cal DS

Wetland monitoring is essential to ensure water levels stay below the proposed sewer line at the Robinson Trail Berm. Creating an opening in the trail berm is part of the 2011 agreement to mitigate the mine's expansion impact. The County requests the following conditions be added to the mine's expansion project:

- CalPortland shall monitor marsh water levels at the new Robinson Trail Bridge to ensure it does not reach the lowest elevation of the sewer main.

4 City Cal

- If water levels approach the sewer main, CalPortland must take corrective action to lower water level to the elevations specified in the EIS document and prevent future rises that could impact the sewer main.

4 cont.

Sincerely,

Steven L. Hartwig, P.E.
Wastewater Utility Manager

What is the name of the Agency or Organization?

Puget Sound Clean Air Agency

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

Operations at this facility are likely subject to Puget Sound Clean Air Agency Regulation I, Section 9.15 (Fugitive Dust Control Measures), Section 9.18 (Crushing Operations), and Section 9.20 (Maintenance of Equipment). The facility should be sure to comply with all applicable Agency regulations.

As a dust mitigation measure, the facility proposes "covering or wetting truck loads or allowing adequate freeboard to prevent the escape of dust-bearing materials". The City of DuPont should assure that this mitigation measure becomes enforceable and should require that all trucks leaving this mine be covered.

Finally, stationary engines may be required to undergo air quality permitting through the Agency's Notice of Construction program (in Agency Regulation I, Section 6, and WAC 173-400), while non-road engines are subject to the Agency's notification requirements in Regulation I, Section 15.

RE: Pioneer Aggregates South Parcel Project; City File No. SEPA2021-002 (DEIS)

As a matter of record the Chambers-Clover Creek Watershed Council is writing in response to the Draft Environmental Impact Statement (DEIS) for the Pioneer Aggregates South Parcel Project, City File No. SEPA 2021-002. The CCWC is a convened body whose mission is to promote the protection and enhancement of water quality, water quantity, habitat, and related environmental components of the Chambers/Clover Creek watershed, Watershed Resources Inventory Area (WRIA) 12. The CCWC 2024-2029 Five Year Action Agenda identifies Stream Flows as the Priority 1 for the Watershed Council. It also continues to identify the Sequalitchew Creek sub-basin as a restoration priority. We also support the recommendations outlined by Washington's Streamflow Restoration law (RCW 90.94), and the 2018 Salmon Habitat Protection and Restoration Strategy for Puyallup and Chambers Watersheds which emphasize the importance of precluding the degradation of wetland systems. Conserving sensitive land helps ensure a healthy, robust, and sustainable salmon population as well as access to clean drinking water.

1
EA
DS

The CCWC commends the DEIS for acknowledging the link between groundwater and surface water flows, however dewatering the Vashon Aquifer in the South Expansion Area does not respect this connection and will exacerbate degradation within the Sequalitchew sub-basin. Thus, we thank you for the opportunity to provide comments on the proposed project.

It is appropriate that Section 3.3.2 of the DEIS, Groundwater Impacts of the Alternatives appropriately details the independent mining/reclamation impacts of Alternative 1 - Proposed Action, and additionally, the Cumulative Impacts sub-section effectively discusses the combined effects of the proposed mining/reclamation under Alternative 1 in combination with the Restoration Plan. This approach offers a better understanding of the irreversible impacts of the proposed action and the necessity for the Restoration Plan. We appreciate this approach, as it underscores that the proposed Restoration Plan was developed as a mitigation measure.

2
DS
Cal

However, the lingering assumption that Sequalitchew Creek is a predominately surface water-driven system is a fundamental mischaracterization. Sequalitchew Creek is, in fact, a groundwater discharge-driven system that has suffered significant adverse impacts due to declining Vashon Aquifer groundwater levels, constrictions to flows, and increasing stormwater runoff. These changes have degraded the once pristine, salmon-bearing upper

Sequalitchew Creek and its associated Edmonds Marsh ecosystem, which were originally sustained by the "groundwater" wetland complex. Similarly, the DEIS (and other related documents) inaccurately refers to the stretch of Sequalitchew Creek between West Edmond Marsh and the steep creek ravine as the "dry reach." It's time this terminology be corrected! A more accurate term would be "losing reach," indicating that surface water becomes disconnected from the groundwater table causing water to move from the stream to the ground through infiltration to adjacent and underlying unsaturated soils giving the appearance of a "dry reach". Figures 1a., 1b. and 2. clearly show that this reach is not "dry" when the groundwater table is higher with the infiltration of precipitation to the aquifer, as evidenced by (Figure 3) showing Lake Sellers the day before Figures 1a., b. and 2. were taken March 14, 2016. Also, in March 2017, and January 2022, I witnessed surface water flows that continued downstream through the entire losing reach all the way to the berm near City Hall.

2 cont

Impacts of proposed actions and restoration efforts for this reach must acknowledge the critical surface and groundwater connections. No attempts should be made to "seal" the reach to establish surface flows. Evidence remains of a failed attempt to do just that with the tangled CalPortland conveyor belts that now litter the creek bed in this losing reach (Fig. 7); these were originally placed there around 2009 in a volunteer stewardship effort to clear invasive plants and seal this reach with a misunderstanding of the surface and groundwater connections. Since the 1843 location of Fort Nisqually on the south bank of Sequalitchew Creek at this location where the creek was then 20' wide, many changes have occurred that are proximate causes to this disconnection with the groundwater table and its transition to a "losing" reach (filling in with Hudson Bay Company activities like the slaughter house over the creek, canals to drain the marsh for agriculture, the Fort Lewis Diversion Canal, and wastewater system changes from infiltrating septic systems to pipes carrying this potential recharge to sewer plants on the Sound, stormwater systems that flush runoff through the streams versus allowing flood plains to serve as aquifer recharge, as well as, obstructions from culverts in berms for roads, rails, and sewer lines that cross the area constricting streamflow and prompting beaver and groundwater responses). You have received a report from Don Russell entitled "RESTORATION OF THE SEQUALITCHEW CREEK WATERSHED", with the Section "Degradation of the American Lake/Sequalitchew Creek Watershed", which details much of this history.

3 DS Cal

The DEIS Page 3.3-9 states, "Sequalitchew Lake has a surface water outlet to Sequalitchew Creek at its Western end, which currently flows into the Diversion Canal ***due to beaver dam blockages***" (Emphasis mine). First, this lacks clarity; also, before 2014, it was common belief that the large beaver dam in eastern East Edmond Marsh prevented the outflow from Sequalitchew Lake, held behind the Diversion Canal Weir, from entering the Sequalitchew Creek channel. However, the beaver dam near the Diversion Canal was breached in the winter of 2015/2016. By March 15, 2016 (when there was also flow in the losing reach) it was evident that surface flows from Sequalitchew Lake, the eastern East Edmond Marsh downstream of the Weir, and the Bell, McKay, and Hammer Marsh complex directed by the Diversion Canal structures (Figures 4, 5, and 6) flowed into the Diversion Canal. This photo evidence correlates to DEIS Figure 3.4-2 as well as the discussion on page 3.4-6. Any "mitigation" or restoration plan for Sequalitchew Creek must recognize surface and groundwater inputs at East Edmond Marsh and consider the repairs of the Diversion Canal

4 DS Cal

Structure by JBLM which will further alter flows and contributions to the Sequalitchew Creek channel from Sequalitchew Lake and the adjacent marsh complex.

4 cont

The Department of Defense has completed feasibility planning for the Lake Sequalitchew Diversion Structure Repair Project at JBLM and has begun permitting. The proposed project includes the removal of fish ladder center structures, canal-creek crossover structures, and beaver dams; the installation of an automated telemetric gate, and the construction of three new weir diversion structures. This project aims to restore stormwater runoff flow, lake flow, and groundwater interflow to the creek and canal conveyance system, correct seasonal storm flows, and regulate lake levels to prevent backwater flow into the spring water distribution system (JBLM Notice of Proposed Activity in a Flood Plain, July 2024). This project is estimated to redirect 724 acre-feet per year back into Sequalitchew Creek (DOE Pub 21-11-012, Watershed Restoration and Enhancement Plan WRIA 12 - Chambers-Clover Watershed).

The JBLM Diversion Canal structure replacement and an updated Sequalitchew Creek Restoration Plan [using elements of the Sequalitchew Creek Restoration Plan proposed in 2014 by Mr. Don Russell in his letter attached to the City of DuPont (Document 5-10-2024) RFI Sequalitchew Creek Restoration Plan 20240430)] are moving in the right direction to protect Sequalitchew Creek and restore its ecological function, without the perpetual adverse impacts of proposed Alternative 1 and the flawed Restoration Plan mitigation. On Pages 1-2 of the DEIS, under Alternative 2 — No Action Alternative, it is stated, "While it is unlikely that the Sequalitchew Creek Restoration Plan would be implemented if the proposal does not occur, it is possible for other funding (e.g., grants) be obtained to carry out the Restoration Plan." An improved phrasing would be "The No Action Alternative will reference the potential impacts of implementing the Sequalitchew Creek Restoration Plan without being tied to the mitigation of Alternative 1's proposed action." Although alternative funding for this Restoration Plan has yet to be identified, elements of the Restoration Plan may be funded through alternative sources (e.g., grants, DOE Hirst Decision Funding, and Salmon Lead Entity identified sources).

5 DS Cal

It is imperative to take a multi-jurisdictional approach to identifying key problems and potential solutions while meeting county, state, and federal requirements to protect water quality, quantity, and habitat from further irreparable damage caused by misunderstandings and misjudgments that allow developments with perpetual adverse impacts — emphasizing the need to restore lost ecological functions. Therefore, the CCWC stands in favor of Alternative 2 – the No Action Alternative – strongly urging the initiation of discussions and the establishment of a committee to develop a Sequalitchew Creek Restoration Plan based on the factual assessment of hydrology, and opportunities for restoration of ecological functions. This plan should identify funding sources that avoid causing ongoing adverse impacts to the Sequalitchew Creek sub-basin and should provide positive impacts to the health of the Vashon Aquifer fed Chambers-Clover Creek Watershed.

6 City DS

The Chambers-Clover Watershed Council (CCWC), leveraging its heritage from the 1993 Chambers-Clover Creek Watershed Management Committee (CCCWMC) established by Pierce County, serves as a clearinghouse for scientific and policy information — possessing deep experience and expertise in the watershed's evolving dynamics. We are committed to

supporting the community of DuPont in Multi-Jurisdictional watershed conversations to ensure a healthy and sustainable watershed for generations that follow.

Kind Regards,

Renee Buck

RE: Comments on the Draft Environmental Impact Statement for the proposed Pioneer Aggregates South Parcel Project

Since 2009, I have served as a consultant to the Environmental Caucus with respect to South Parcel mine proposal and Sequalitchew Creek Restoration Plan. Caucus representatives are in support of the following comments.

I have conducted a targeted review of this document on behalf the Environmental Caucus, with a focus on the "Groundwater" and "Surface Water" sections of the Affected Environment (Sections 3.3 and 3.4 of the document), along with their summaries presented in Section 1. I have identified two topics that should motivate minor changes to this DEIS.

1. Conformance of the 2017 South Parcel Monitoring Plan

The South Parcel Monitoring Plan is attached as Appendix F to the DEIS, but its substantive requirements are not described in much detail in the DEIS's Groundwater section. The Plan was the subject of multiple meetings and draft documents through much of 2017, with the final version approved by the Environmental Caucus and with explicit commitments to further actions by both CalPortland and the Environmental Caucus, should the actual declines in groundwater levels exceed the amounts anticipated by the modeling. As the Plan was developed, I worked closely with Mindy Roberts of Washington Conservation Action and representatives from the Nisqually Delta Association.

1
DS
City

The 2017 plan reads as follows:

> "Throughout the adaptive management process, status updates, monitoring data, and final reports will be shared with the Environmental Caucus. Should groundwater levels not meet the performance thresholds established in this plan, then CalPortland would notify the Environmental Caucus and plan and implement adjustments. If adjustments are unsuccessful in meeting predicted groundwater levels, CalPortland and the

> Environmental Caucus would initiate a technical review conference and, if necessary, meet and confer to share information and determine the appropriate additional steps" (p. 10).

This document also outlined an extensive "Meet and Confer Process" (Section 4.2.6), as authorized in Section 7.3 of the Settlement Agreement, should the groundwater levels not meet the criteria established in the Monitoring Plan.

The DEIS, in contrast, does not provide many of the details that have been incorporated into the Monitoring Plan, and it is quite nonspecific as to the process that would be followed in the case of unanticipated response:

DEIS, pp. 1-21, 3.3-32:

> "• If performance threshold water levels are exceeded, adaptive management responses (such as adjusting the dewatering operations and/or the boundaries and depth of mining so that performance threshold exceedances do not occur) would be required before additional mining could occur.
>
> "• Since dewatering Step 3 would be irreversible, increased monitoring vigilance at different phases of Step 3 as dewatering and mining progress southward could be warranted to ensure that performance threshold water levels are not exceeded."

The DEIS should be revised to articulate more explicitly the actions that both parties (Environmental Caucus and CalPortland) have already agreed to under such circumstances in the 2017 Monitoring Plan. The present wording implies that an indeterminate range of actions could be sufficient to allow additional mining to proceed.

1 cont.

2. Reemergence of a previously analyzed and rejected mitigation strategy

One of the earliest (2010) proposed mitigation measures for the South Parcel mine was a pump/gravity drain of the intercepted groundwater, dubbed "North Sequalitchew Creek" and ordained with the prospect of significant environmental benefits. None of these benefits, save its efficiency in conveying groundwater out of the mining area, could be substantiated in the course of subsequent review. As noted in the DEIS, this measure does not increase flows between Sequalitchew Lake and the ravine, nor does it mitigate for any reductions in groundwater levels beneath the marsh complex should the anticipated drawdowns be exceeded. Most importantly, it does not address the fundamental impairment of this watershed, namely the loss of water out of Sequalitchew Lake into the Diversion Canal. For all of these reasons, this suite of related

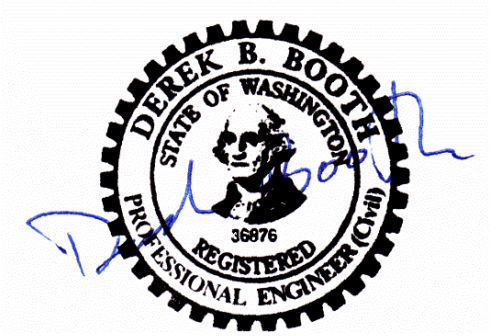
2 DS City

actions has been abandoned for over a decade as a credible mitigation measure.

Despite this history, the DEIS includes several variations of this action in its list of "groundwater contingency mitigation measures that could be implemented." They appear in six separate locations in the DEIS (pp. 1-22, 1-25, 1-29, 2-29, 3-3.33, and 3.5-17). Extracting this discredited "mitigation" from a 14-year-old document and presenting it as a credible contingency mitigation measure, without any clear designs or substantive evaluation, is a disservice to the extensive efforts that have gone into crafting the Final Restoration Plan (in which measures of this nature nowhere appear). It also distracts from the fundamental requirement for the restoration of the Sequalitchew Creek watershed: reestablishment of headwaters-to-Sound water flow through the wetland and creek complex downstream of Sequalitchew Lake.

2 cont.

In summary, any groundwater contingency mitigation measures presented in the DEIS should be clearly linked to the agreed-upon monitoring thresholds that might trigger such actions, and they should demonstrate a direct relationship to the impact that has given rise to their consideration. All others should be removed from the document.



Subject: **DEIS for Pioneer Aggregates South Parcel Projects**

Date: **July 15, 2024**

To: **Barbara Kincaid, City of DuPont SEPA Official,**

Thank you for the opportunity to comment on the Pioneer Aggregates South Parcel Project, City File No. SEPA2021-002. My name is Kirk Kirkland and I have reviewed various settlement agreement since 1994, between CalPortland, City of Dupont and Nisqually Delta , Black Hills National Audubon Society and Tahoma Audubon Society.

Again in March 2021 – CalPortland and the Environmental Caucus of non-governmental organizations finalized the Sequalitchew Creek Restoration Plan Funding Agreement and CalPortland funding the Restoration Plan Permit Fund per the terms of the agreement.

That Sequalitchew Lake can never be a suitable water source for Edmond Marsh and Sequalitchew Creek is a myth perpetrated by the CalPortland consultants to conceal the fact that dewatering the Vashon aquifer will cut off Vashon aquifer discharge as the sole source of water in Edmond Marsh and in the upper and lower reach of Sequalitchew Creek.

1 DS City Cal

The obvious remedy for this is to leave intact the restore Edmond Marsh by remove Beaver dams and then to intercept the Vashon aquifer groundwater to flow in Edmond Marsh flows then down the canyon reach of Sequalitchew Creek.

In addition the proposed Sequalitchew Creek Restoration Plan is based upon Core Group members fleshing out the five essential action elements prescribed by the Agreement This consensus was not based upon an understanding of (1) the natural hydrological condition and functioning of the Sequalitchew Creek watershed, (2) of the watershed's current impaired condition, and (3) of habitat conditions that existed when native salmon populations did inhabit this watershed.

2 DS City Cal

Increasing surface water flow from Sequalitchew Lake into Edmond Marsh's was intended for mitigation for dewatering the Vashon aquifer. However, groundwater discharging into Sequalitchew Creek is not congruent with the Plan's Vision *"…to restore flows and ecological conditions for native salmon populations in the Sequalitchew Creek Basin."*

3 DS City Cal

The Agreement's proposed Restoration Plan, if implemented, will not result in realization of the Plan's stated vision and more important the mitigation does not provide long- term flow in the creek when the pumps are turned off in 2038

At the Environmental Coalition, we are would like to see that the next phase of gravel mining results in a restored gravel mine where de watering if used in a limited basis is to restore Edmunds March permanently and to plant and replace the forests and wetlands that stood on these 313 acres.

4 DS City Cal

To accomplish this goal, we would like to use the final mining phase to lay the foundation for a city park that will provide a forest canopy sufficient to provide carbon sequestering needed for reduce effects of global warming. The current mine must also mitigate for the loss of natural forest found in 1994 and its effect on climate change during the mining operation.

To accomplish these goals, we ask that the city council consider requiring a Supplemental Environmental Statement to modify the two proposed Alternatives.

Non-member of the Environmental Caucus:

The Environmental Coalition of Pierce County was not a member of the "core group" which included the Environmental Caucus which represented a number of non-profit organizations including the Nisqually Delta Association (NDA), the Black Hills Audubon Society, Washington Environmental Council (WEC), the National Audubon Society, People for Puget Sound, the Tahoma Audubon Society, the Seattle Audubon Society

Many of these organizations involved in the agreement have since changed their name or their mission or are no longer in existence which include Tahoma Audubon Society, People for Puget Sound, Washington Environmental Council and Seattle Audubon Society.

Section 4.5.3

At the Environmental Council we disagree with the decision that under Section 4.5.3 of the Agreement, between CalPortland and the Environmental Caucus which approved of the Restoration Plan which deemed the plan to be, "adequate mitigation of all direct and indirect impacts of mining on Sequalitchew Creek" and that implementation of the plan is intended to constitute "more than 'mitigation" as defined in WAC 197-110-768 (Page 78 of 1995 pages)

5 DS City Cal

Since this agreement was signed we believe that several conditions have changed and that the Restoration Plan no longer meets the requirements of

the Revised Code of Washington and the City of Dupont's municipal code and Comp Plan Goals regarding critical area ordinances

> According to Section 4.5.3. the Environmental Coalition is not bound by the agreement. Under Section 4.5.3 of the Agreement, This part of the agreement is binding only on the nongovernmental entities. The agreement also acknowledges that further mitigation measures may be suggested and implemented through the applicable permit processes.

5 cont.

The two alternatives considered the Draft EIS are not consistent with the goal to preserve Edmunds Marsh. They are in violation of the Critical Areas Ordinance and the City's 2015 Comprehensive Plan. The proposed South Parcel Mine Expansion can not proceed because it is not consistent with the 1994 agreement with CalPortland (former Lone Star) over the expansion of the gravel mine. That agreement called for (on Page 22), “WRECO and Lone Star agree to seek no permits in the future to mine in a manner that would significantly impact the flow of Sequalitchew Creek”.

Failure of the proposed mitigation plan:

The following significant Unavoidable Adverse impacts are listed on page 405 pf the DEIS):

- *"Water temperature in Sequalitchew Creek would be warmer than under existing conditions from April through September and would likely exceed the 7-day average of daily maxima criterion of 16°C in multiple months between May and September.*

- *"Water levels in Edmond Marsh would be lower than existing conditions by up to 3 feet. This impact is primarily attributable to the Restoration Plan and is necessary to achieve flow from Sequalitchew Lake to the Sequalitchew Creek ravine. However, the change in water level also includes the impact of changes in groundwater levels from dewatering for mining.*

- *"Water levels in isolated lakes and kettle wetlands would be lower by the amount of the change in groundwater levels from dewatering. The decrease would be 3 feet for Wetland 1D, 2 feet for Pond Lake, 1 foot for Wetlands #8 to #11, and 0.5 feet for Old Fort Lake. •*

- *"There would be periods, approximately 10 percent of the time, when flows in Sequalitchew Creek with the Proposed Action and Restoration Plan would be lower than under existing conditions*

- *"Another potential drawback of CalPortland's mitigation action is that it is, at best, a temporary action because pumping in perpetuity is not feasible, and groundwater discharge/infiltration to the commingled Vashon-Sea Level Aquifer would substantially decrease . In addition, it likely would over-mitigate expected dewatering impacts to Sequalitchew Creek if active year-round (as opposed to only during certain dry or low-flow conditions)" according to the DEIS page 36.*

- *"In addition the proposed restoration plan includes several contingent measure for consideration and/or further study to supplement Sequalitchew Creek flows during dry periods when no outflow from Sequalitchew Lake occurs or if the Restoration Plan. These plans have not considered the drought summers since 2019 that has effected Sequalitchew Lake and other natural sources.*

- *"Many of the mitigation measures are likely at best, **a temporary action because pumping in perpetuity is not feasible**, according to Page 36 of the DEIS*

This proposed restoration technique is flawed because it will provide substantial pumped groundwater flow from the west end of Edmond marsh and down the ravine reach of Sequalitchew Creek. However, once the dewatering pumps are turned off and removed water in Edmond Marsh and flow in the ravine reach of Sequalitchew Creek will disappear.

The proposed restoration plan for the Edmunds Marsh is dependent on an extensive array of dewatering pumps around the south and east perimeter of the mine pit. The combined discharge of these pumps is discharged into Edmond Marsh. And consequence of permitting dewatering of the Vashon aquifer will only become evident when the dewatering pumps are turned off 14 years hence.

The proposed restoration plan does not include a long-term solution for the loss of Edmunds Marsh and associated wetlands. It is a net loss of wetland values and functions. In the year 2038 there will be no viable salmon habitat in the Sequalitchew Creek sub watershed, no functional Edmond Marsh wetland, and no groundwater discharge flow in Sequalitchew Creek.

6 DS City Cal

Dupont Critical Area Ordinances:

Dupont municipal Code (DMC 25.105.010: Directing a policy of no net loss of wetland and stream function, Value, and area within the city.

DMC 25.105.010: Preventing, to the extent practicable, adverse cumulative impacts to water quality, wetlands, stream corridors, and fish and wildlife habitats using best available science

7 EA City

2015 Comp Plan Goals

Natural Environment Goal NE-1: Protect DuPont's natural environment by meeting the needs of today's citizens without compromising the needs of future generations.

- NE 1.1 Preserve environmentally sensitive areas and those that are valuable natural and aesthetic resources to the City
- **NE 1.4** Work with JBLM, The Department of Ecology, Glacier NW, environmental groups, and other affected parties to restore and improve the flow of water through Sequalitchew Creek.

Natural Environment Goal NE-5: Restore historic stream flow, improve habitat conditions, and promote long term preservation efforts within the City.

8 EA City

- **NE 5.1** Maintain and where possible restore and enhance ecological functions and values of the Sequalitchew Creek Watershed, lakes, marshes, streams, wetlands, bluffs, and recognize the potential for passive public access on or at Old Fort Lake

- **NE 5.3**. Maintain important wildlife habitats and function wildlife corridors to link important natural areas such as Edmond Marsh and Sequalitchew Creek.

8 cont.

This DEIS does not implement the agreements of 1994, 2011 and 2021 that calls for the permanent wetland function of Edmunds Marsh in the 1994 agreement "to seek no permits in the future to mine in a manner that would significantly impact the flow of Sequalitchew Creek".

In other words, with Alternative 1, the Sequalitchew Creek watershed will become a groundwater discharge area deprived and dysfunctional as much as the Clover and Chambers Creek Sub basin and Watershed has been de-watered by extensive suburban development in Spanaway and Lakewood and recent summer droughts since 2019.

9 DS City Cal

Supplemental Environmental Analysis needed

For this reason we are asking Dupont City Council to fund a Supplemental Impact Analysis that will study proper mitigation for the proposed de-watering scheme. As proposed there is no meaningful mitigation for the impacts of South Parcel mine expansion that is meaningful mitigation on for the draining of the Vashon Aquifer and Sequalitchew Creek that does not end in 14 years.

- **Impact on Creek Ravine**: The expansion plans are to dewater the Vashon Aquifer, which will severely impact the Sequalitchew Creek Ravine. According to the proposal (page 3.1-14), the seeps and springs that sustain the creek year-round will be drastically reduced or eliminated. The potential consequences of this dewatering will result in:

- **Drying up of vegetation:** The lush vegetation that thrives in wet conditions may struggle or die off. Plants adapted to moisture may wilt, lose leaves, or become dormant.
- **Soil erosion:** Without the binding effect of wet soil, erosion becomes a concern. Rainwater can wash away loose soil particles, leading to gullies and landslides.
- **Loss of wildlife habitat:** Animals and insects that rely on the wet environment may move elsewhere or face challenges finding food and shelter.
- **Temperature changes in the creek:** The loss of cool groundwater and the drying up of vegetation will lead to significant temperature changes in the creek, affecting aquatic life.
- **Decreased biodiversity:** The impact on groundwater will lead to decreased biodiversity in the ravine.
- **Drying up of the tree canopy:** The extensive tree canopy, which provides shade, cooler temperatures, and habitat for wildlife, will dry up, altering the landscape dramatically.

10 DS City Cal EA

- **Loss of Aquifer seeps:** No mitigation measures in the proposal effectively address the loss of the Vashon Aquifer seeps, leading to the irreversible degradation of the Sequalitchew Creek watershed.

10 cont.

Alternate Creek Restoration Plan for long-term mitigation.

Phase 1 This Alternative Restoration Plan for the Sequalitchew Creek watershed is based upon an *understanding of the hydrology of the area*, *native salmon habitat requirements* and the *conditions that now adversely impact water quality* in the Sequalitchew Creek watershed. And some information comes from the 1997 Chambers-Clover Creek Watershed Management Committee Watershed Characterization report.

The alternative proposal for mitigation would embody the following actions:

- **Removal of the culvert beneath the berm** located in the vicinity of City Hall. It should be replaced with either an open box culvert or a foot bridge and removal of the sidewalk beneath the Center Drive overpass.

  Both of these actions should be undertaken and completed before removing existing beaver dams. The culvert and sidewalk are physical obstructions to flow in a surface water drainage ditch or sometimes call a “dry reach of Sequalitchew Creek”. This should be removed as an integral part of the City’s obligation to properly design, construct, operate and maintain its surface water management system.

  DuPont city codes recognize such drainage ditch work as necessary and highly desirable. Furthermore this work can be undertaken as soon as practical without an HPA permit since no in water work of a salmon bear stream is involved. Such an opportunity will be negated by releasing up gradient beaver dam impound water prior to this work being completed.

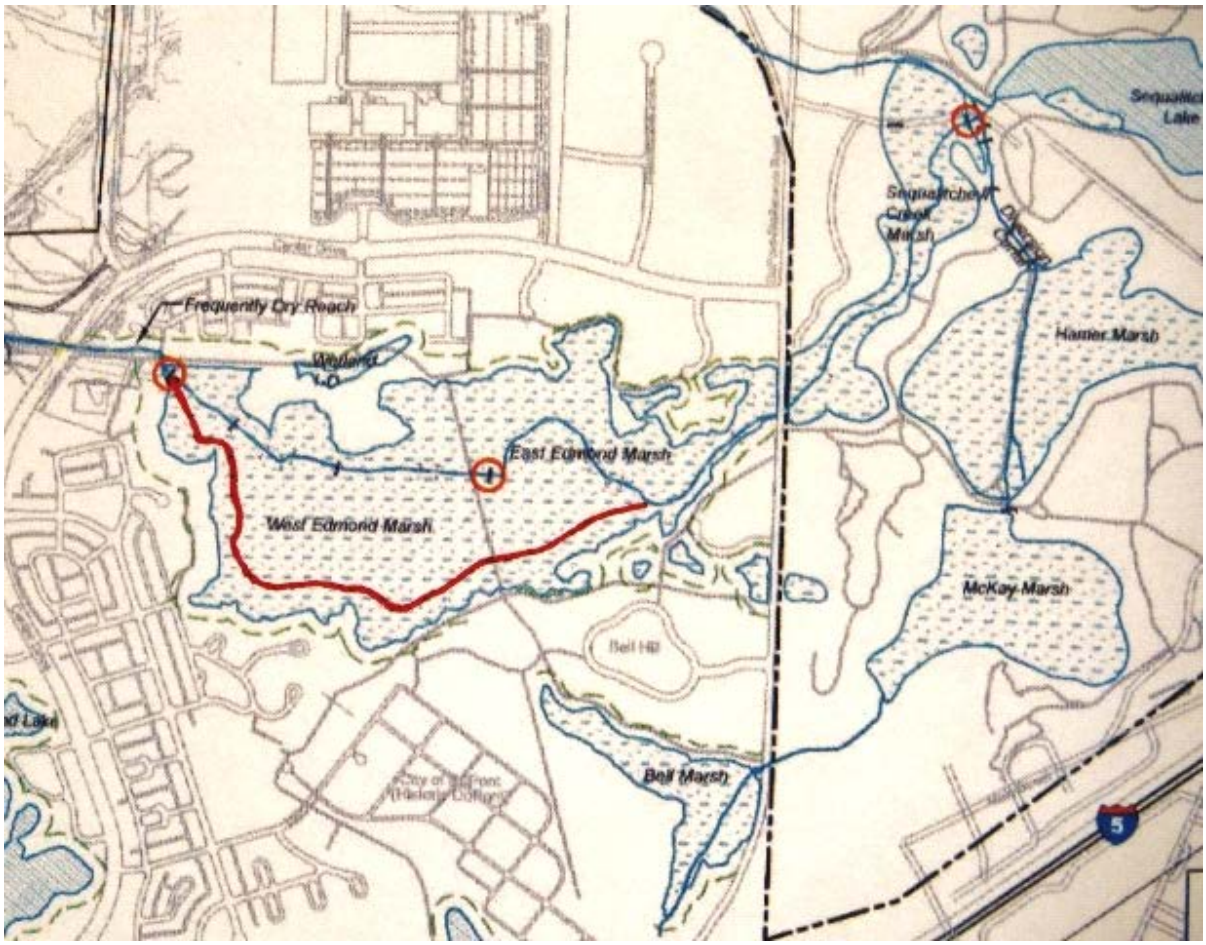
- Our Sequalitchew Creek Restoration Plan does not require dewatering the Vashon Aquifer. It provides long term mitigation that enhances the restoration needed after the gravel mine is abandoned. It would keep groundwater flowing through the wetlands and creek, along with the water diverted from Sequalitchew Lake.

11 DS City Cal

Phase 2 Ground water interception:

This plan should be studied with a Supplemental Environmental Analysis which calls for intercepting Vashon Aquifer ground water flow from the southeast to northwest flow by constructing a groundwater interception and discharge fed into Sequalitchew Creek all along the eastern boundary of Edmond Marsh as shown in red on the illustration below.

12 DS City Cal



Map showing alternative to be studied that shows intercepting the southeast to northwest subsurface groundwater flow of the Vashon Aquifer by constructing a groundwater interception and discharge fed into Sequalitchew Creek all along the eastern boundary of Edmond Marsh

---

- Construction of a ground-water-interception channel from the Vashon Aquifer would assure perennial Coho salmon inhabitable and groundwater discharge flow from east to west through Edmond Marsh and down the ravine reach of Sequalitchew Creek.
- After the culvert and side walk impediments to surface water runoff flow is accomplished, the Edmond Marsh pond should be removed so that it is lowered to its pre-beaver dam impact level. Further beaver dams should be removed downstream in such a way to sequence beaver dam removals until all beaver dam impediments to east to west flow are removed from the East and West Edmond Marsh.
- The eastern most beaver dam should remain in place until it is established that surface water flow from Sequalitchew Lake has sufficient flow from groundwater discharge alone from groundwater discharge flowing into Sequalitchew Creek and Edmond Marsh complex
- The result of beaver dam removal and clearing existing culverts will be

12 cont.

a lower surface water level throughout Edmond Marsh (its historic condition) and restoration of a significant and unimpeded east to west flow of a seasonally fluctuating in quality, quantity and mix of surface and ground water flowing through the system.

- Once all the Beaver dams are removal the enhanced water flow through Edmond Marsh to the accumulated fine grained sediment from the groundwater fed areas will be flushed out of Edmunds Marsh and work to “seal” the “dry reach of Sequalitchew Creek”, thus assuring enhanced surface water flow through this “dry” drainage ditch.

12 cont.

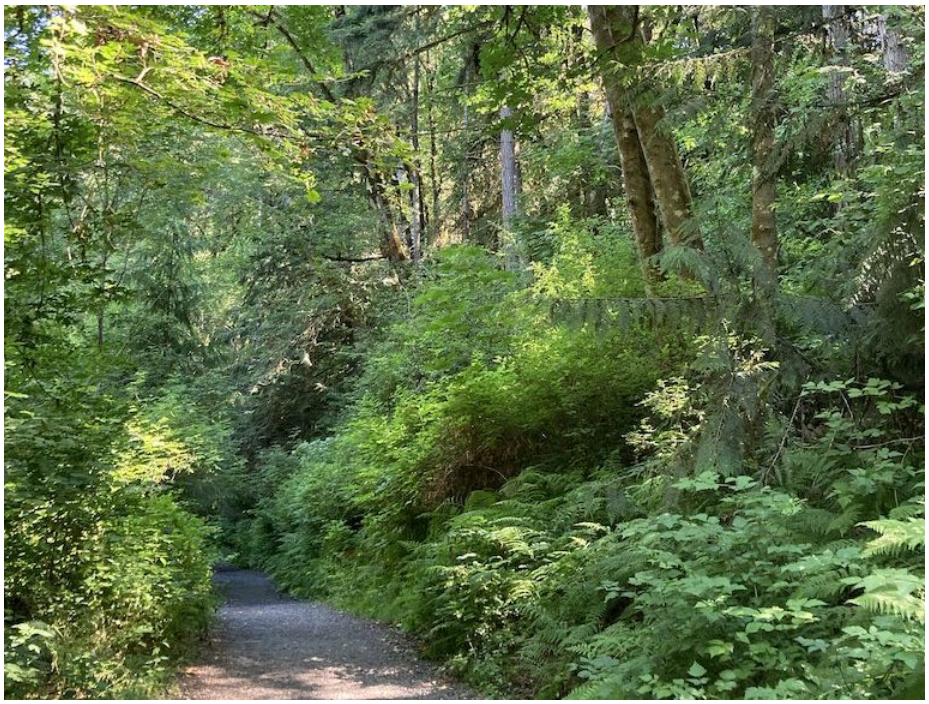
Contrast this restoration proposal to the DEIS proposed action which uses warm, low dissolved oxygen concentration of surface water flow from Sequalitchew Lake that includes additional stormwater runoff and other surface water flow from Bell, McKay and Hamer Marshes that will not meet clean water standards. Such a notion that Alternative One Restoration Plan will restore Edmond Marsh wetland is a fatally flawed.

13 City DS

Please review the Sequalitchew Creek Restoration Plan with a Supplemental Analysis. It has potential to comply with Dupont's Comp Plan of 2015, **Natural Environment Goal 5.1** to **"**maintain" and "enhance ecological functions and values of the Sequalitchew Creek Watershed, lakes, marshes, streams, wetlands."

border and mind and sound.jpg

Photo of mine showing previous mitigation retaining forested buffers along the shore. Other mitigation eliminated bright lights on docks that disturb migrating birds and eliminated use of gravel trucks for delivery in Puget Sound and to the dock on Puget sound..



pix trail & Sequalitchew-Creek.jpg

Popular Sequalitchew-Creek trail through undisturbed forest.

Conclusion:

Since the first settlement agreement in 1994, CalPortland and the following mining owners have delivered on several critical mitigation requirements that law a foundation for restoring the gravel mine to it's former condition. Such mitigation included the reduction of dock size, removal of dock lighting that would have affected birds in the adjacent National Wildlife Refuge. And one of the most important mitigation requirement was to retain the tree buffer along the railroad tracks and beaches of Puget Sound.

Look at the scar left by Chamber Bay Golf course and the millions of dollars required to create 400 acre recreation area. These two previous mitigation requirements in Dupont were very important for the neighboring National Wildlife Refuge and residents on Anderson Island. Large docking facilities with truck delivery with bright lights were required by State Environmental Policy Act for mitigation for light and glare regulations.

14
City
DS
Cal

The previous company owners should be commended for their adherence to permit conditions and their willingness to recognize the value that local environmental groups can provide to improve mitigation and preservation for people on trails and for wildlife and their habitats.

Now after 30 years of operation, with just 14 years of operation in sight, Dupont Municipal Code and Comp Plan require looking at how this next phase of mining will result in a natural area for next generation of residents in Dupont/Northwest Landing and Pierce County.

Edmunds Marsh has been for decades a valued area for migrating birding and wildlife that provides a place for quiet. Some of the over 20,000 people in Northwest Landing & Dupont are found on any weekend hiking the Sequalitchew Creek Trail.

A viable mitigation option must be found to offset the permanent damage by the de-watering of the Proposed Action One and for the expansion of the mine. As proposed this restoration plan for the creek and Edmunds Marsh would result in the loss of existing conifer forest/scrublands, the existing kettle wetland, and associated animal habitat on the site. These areas are protected by Dupont municipal code and Comp Plan goals.

14 cont.

Even more important is that the proposed restoration has no lasting value. It ends the day the pumps are turned off. It is a meaningless short term mitigation that ends in 14 years.

More important, the final phase of expansion of the mine, must leave behind a recovery plan that replaces places the scar of mining with the forests and wetlands that were hear when the mining permit was issued.

Thank you for this opportunity to comment.

Re: Pioneer Aggregates South Parcel Project
City File No. SEPA2021-002
City of Dupont, Washington

To Whom It May Concern:

The following is a public comment submitted by the Garry Oak Coalition, a Washington State 501c3 non-profit based in Lakewood, regarding the Pioneer Aggregates South Parcel Project, City File No. SEPA2021-002. This submission is being made during the public comment period for the Draft Environmental Impact Statement (DEIS). Please make us a party of record and inform us of any future decisions, comment deadlines or public hearings related to this matter.

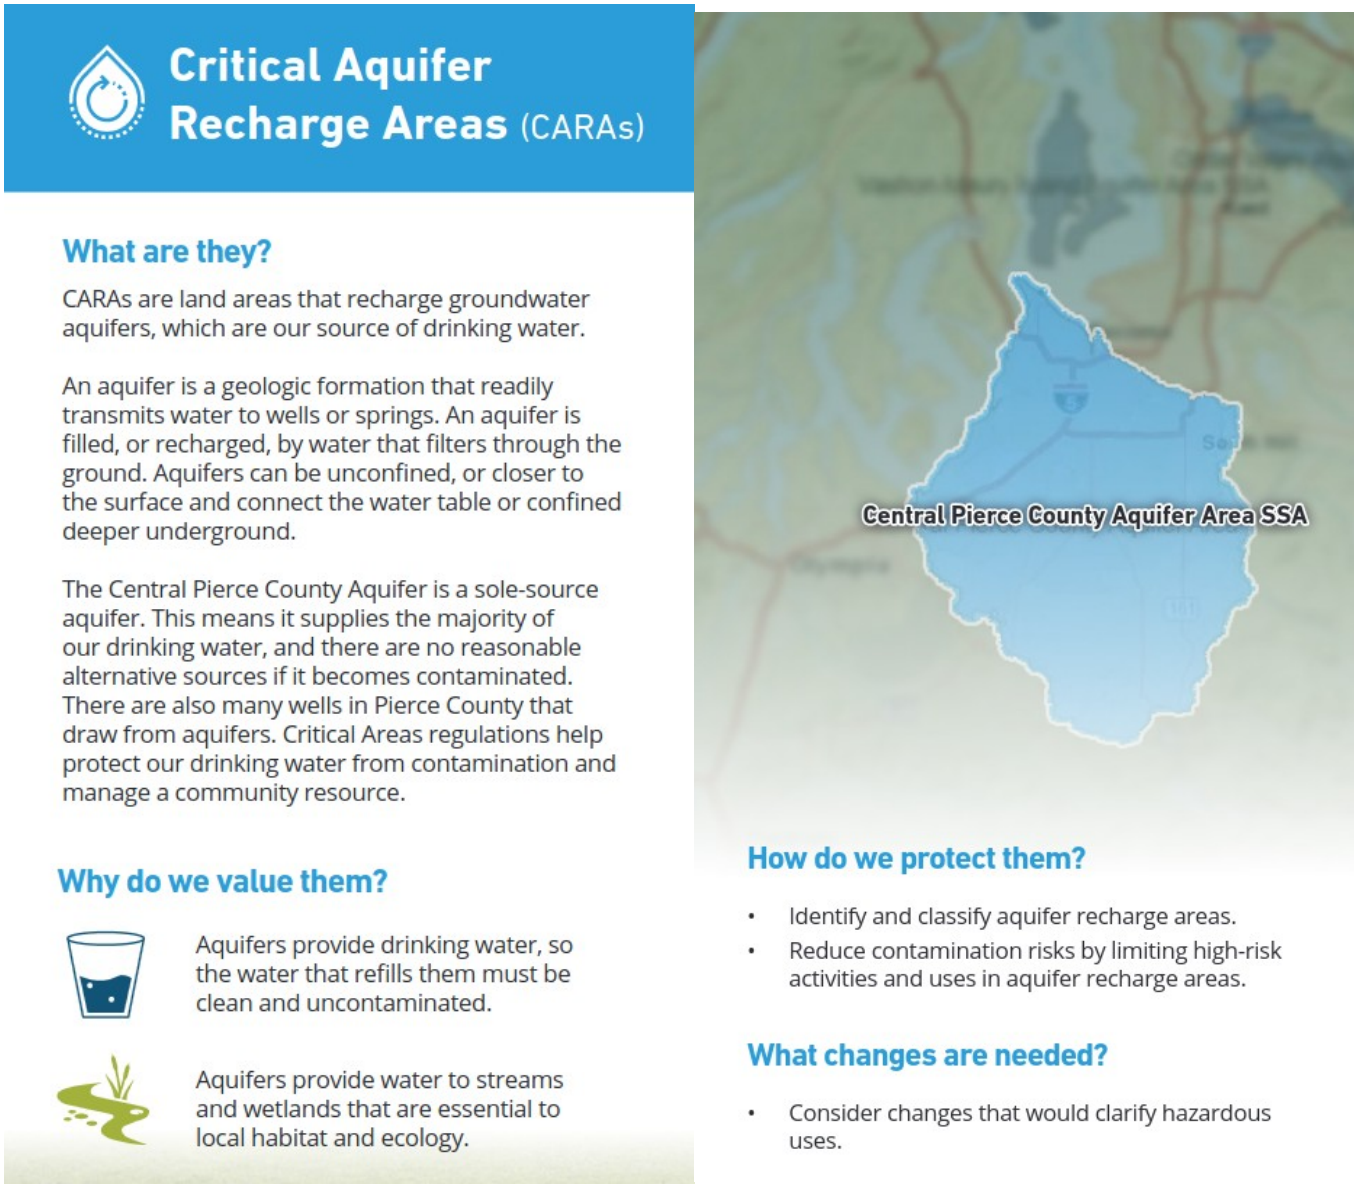
We would like to express our grave concern about any plans to “dewater” the aquifer, our opposition to further expansion of any mining activities in this environmentally sensitive and biologically diverse area, and our firm support of a restoration plan for Sequalitchew Creek and environs, as proposed by numerous environmental non-profits in the past, as well as the protection of Edmond Marsh and the aquifer in general.

1
DS
EA

We also subscribe to comments submitted by Kurt Reidinger in 2021, Don Russell (current and past comments), Eric Chandler, and the Chambers-Clover Creek Watershed Council.

As Pierce County itself points out, this area is a sole source aquifer and as such must be protected. See below for example a county publication for the public, accessed at https://www.piercecountywa.gov/DocumentCenter/View/1:21877/Critical-Aquifer-Recharge-Areas?bidId=

2
DS



Clearly, sole source aquifers should not be dewatered, and no plan involving dewatering should be considered.

3
DS

Scientists have been increasingly sounding the alarm about the drastic effects of excessive groundwater withdrawals. In our region, we are seeing what used to be virtually perennial creeks and wetlands drying up, and research has recently shown that excessive groundwater withdrawals have even affected the tilt of the Earth.[1] Clearly, there should be no talk of "dewatering" of our sole source aquifer.

We are also in a biodiversity crisis, which has had terrible consequences for our region's salmon – a key part of our ecosystem. As NOAA has stated: "Pacific salmon are keystone species, and play an

1 https://www.scientificamerican.com/article/rampant-groundwater-pumping-has-changed-the-tilt-of-earths-axis/

essential role in the health and function of ecosystems. Salmon benefit other species as food and their bodies enrich habitats through the cycling of nutrients from the ocean to freshwater streams." In addition, they have played a critical role in the culture and food economy of the region's native peoples for millennia. Sequalitchew Creek, as a salmon-bearing creek, needs to be restored and protected from further adverse environmental impacts.

4 EA

Please see recent articles in the *Seattle Times* urging salmon restoration by Willie Frank III, chairman of the Nisqually Tribe and Ron Garner, president of the Puget Sound Anglers State Board[2], as well as Leonard Forsman, chairman of the Suquamish Tribe, wrote in April.[3]

Today, the number salmon, once so unbelievably abundant, is dwindling. This has prompted people throughout the region to launch initiatives to help save the salmon and restore their habitat. This has included the breeching of dams and creek restoration. Restoration of salmon habitat is incompatible with the expansion of mining near Sequalitchew Creek and the dewatering of the aquifer. We urge the responsible authorities to facilitate and require the restoration of habitat and not its further destruction.

The biodiversity crisis is not limited to salmon of course. You have heard from commenter Eric Chandler about the profusion of fungi, including rare and possibly even unique species. Others, including Kurt Reidinger, in his 2021 comment, have noted that: "[t]his area, the ravine, has diverse conditions and thus harbors a diverse flora (with at least one rare, state-sensitive species)".

We are living in a time that many have begun to call the Sixth Extinction. Mass die-offs are occurring with disturbing frequency. It is a time that requires that we secure maximum protections for biodiverse areas such as that at Sequalitchew Creek – not only for the benefit of the wildlife, the flora and fauna, but we humans, too, who are also a part of the ecosystem. Our interconnectedness must not be forgotten.

5 City EA

Thank you for your serious consideration of the critical issues that we have touched on above.

We are depending on the City of Dupont as the local authority to do the right thing: protect our environment from further degradation and act now to ensure its restoration.

Sincerely,

Christina Manetti

WASHINGTON CONSERVATION ACTION

July 22, 2024

Barb Kincaid
City of Dupont
1700 Civic Drive
Dupont, WA 98327

Dear Ms. Kincaid:

Thank you for the opportunity to provide input on the **Draft Environmental Impact Statement for the proposed Pioneer Aggregates South Parcel Project**. Washington Conservation Action Education Fund (WCA) is a 501(c)(3) organization founded in 1967 as Washington Environmental Council (WEC). Our mission is to develop, advocate for, and defend policies that ensure environmental progress and justice by centering and amplifying the voices of the most impacted communities. We are committed to water and habitat protections for all Washington State waters and communities.

WEC and People For Puget Sound (now a program of WCA) were signatories to a 1994 Settlement Agreement for the proposed Lone Star Northwest Dupont gravel mining expansion and dock construction that would have significantly impacted delicate shorelines around the Nisqually Delta area and north. Ecology had denied a Conditional Use Permit in 1993 and significant disputes had preceded that denial. Through mediation, the organizations agreed to a new vision for the Dupont shoreline and created a framework for cooperative efforts (see Attachment 1 – 1994 Settlement Agreement).

1 DS City

Since 2017, WEC and our partners in the Environmental Caucus have been negotiating with CalPortland on details and funding of the restoration plan for the Sequalitchew Creek watershed, which generally calls for funding and permitting of the restoration plan as a condition of the Environmental Caucus not opposing the mine expansion. We negotiated a Sequalitchew Creek Restoration Plan Funding Agreement and an Acknowledgement Agreement Regarding Sequalitchew Creek Restoration Plan and Monitoring Plan for South Parcel Mining that included several steps where the company agreed to multiple safeguards with the Environmental Caucus.

The DEIS as currently written falls short of incorporating key parts of the agreed-upon monitoring plan. Please see the detailed July 15, 2024 letter submitted by Derek Booth on behalf of the Environmental Caucus. We urge the City of Dupont to make each change identified by Derek Booth.

2 DS City Cal

Thank you again for the opportunity to comment on the Draft EIS. If you have questions regarding these comments, please do not hesitate to contact us.

Sincerely,

Mindy Roberts, Ph.D., P.E.

SETTLEMENT AGREEMENT
FOR
LONE STAR NORTHWEST DUPONT PROJECT

THIS SETTLEMENT AGREEMENT is dated this 25th day of December, 1994, and executed by and among the WASHINGTON STATE DEPARTMENT OF ECOLOGY ("Ecology"); the CITY OF DUPONT ("City"); LONE STAR NORTHWEST, INC. ("Lone Star"); WEYERHAEUSER REAL ESTATE COMPANY ("WRECO"); the NISQUALLY DELTA ASSOCIATION ("NDA"); the BLACK HILLS AUDUBON SOCIETY; the WASHINGTON ENVIRONMENTAL COUNCIL ("WEC"); the NATIONAL AUDUBON SOCIETY; PEOPLE FOR PUGET SOUND; the TAHOMA AUDUBON SOCIETY; the SEATTLE AUDUBON SOCIETY; and ANDERSON ISLAND QUALITY OF LIFE COMMITTEE ("Anderson Island QOLC").

Recitals

A. Lone Star and WRECO are the proponents of the Pioneer Aggregates Project, which is described in an Environmental Impact Statement issued by the City of DuPont and the State Department of Ecology on February 4, 1993. The originally proposed project involves a sand and gravel mining operation and improvements to an existing dock to accommodate a sand and gravel barge transshipment facility for transport of related construction materials. The project is proposed on lands within the City of DuPont limits, most of which are owned by WRECO and leased by Lone Star. The Nisqually Delta area contains important wetlands, shoreline, and upland habitat and wildlife, and is rich in natural resources including gravel resources.

B. The City approved a Site Plan Approval, Shoreline Substantial Development Permit, and a Shoreline Conditional Use Permit for the Pioneer Aggregates Project on September 2, 1993.

C. On October 15, 1993, Ecology denied the Conditional Use Permit pursuant to RCW 90.58.140(12) and appealed issuance of the Substantial Development Permit to the Shorelines Hearings Board (SHB No. 93-65).

D. On October 15, 1993, the NDA and the Black Hills Audubon Society appealed the City's decision to issue a Shoreline Substantial Development Permit and Shoreline Conditional Use Permit to the Shorelines Hearings Board (SHB No. 93-64).

E. In addition, the NDA and Judith Krill and Karl Krill appealed the Site Plan Approval to Pierce County Superior Court (Pierce County Cause No. 93-2-09515-1). Judith Krill and Karl Krill have dismissed their appeal.

F. On October 26, 1993, WRECO and Lone Star appealed Ecology's denial of the Shoreline Conditional Use Permit to the Shoreline Hearings Board (SHB No. 93-69). All of the respective shoreline appeals were consolidated by order of the Shorelines Hearings Board in its Pre-Hearing Order dated December 14, 1993.

G. Long-standing disputes have surrounded the appropriate shoreline designation and permitted uses of the subject shoreline area in the City of DuPont as detailed in the Requests for Review of the various parties. In 1975, the subject portion of the Dupont Shoreline of Statewide Significance surrounding the dock was designated "Urban" under a Master Program approved by the City and Ecology. The use of the shoreline for an industrial-related dock has been disputed in prior court proceedings because of the proximity of the existing dock to the Nisqually National Wildlife Refuge and its location on a shoreline of statewide significance. In 1990, Lone Star submitted permit applications for the Pioneer Aggregates Project which proposed use and rehabilitation of the DuPont dock for a sand and gravel barge transshipment facility. The Lone Star proposal renewed opposition to the Urban shoreline designation, and the subject appeals eventually ensued.

H. In January 1994, the parties retained a professional mediator to facilitate settlement discussions to determine whether a settlement agreement that meets the needs and interests of the various parties could be reached.

I. Through the mediation sessions, a new vision for the DuPont shoreline has emerged which, if implemented, will end the long-standing disputes between various parties to this Agreement and establish a framework for cooperative efforts among the various interest groups. This framework would ensure that the shoreline of statewide significance is preserved and protected in a manner that allows enhanced public access for the citizens of DuPont, while allowing valuable gravel resources to be available to the Puget Sound region. It is the desire of the parties to reach a lasting settlement.

J. In order to avoid protracted litigation and its associated costs, all parties desire to resolve fully all of their disputes regarding the Pioneer Aggregates Project. It is understood that the parties undertake this compromise and settlement of disputed issues of law and fact without admitting any error or liability with respect to their previous actions or legal positions.

K. For purposes of this Agreement, certain terms shall have the following meanings: the term "parties" shall mean the undersigned parties to this Settlement Agreement; the term "non-governmental parties" shall mean all parties, except Ecology and the City.

In consideration of the promises and covenants contained herein, the parties agree as follows:

AGREEMENTS

I. PROGRAMMATIC AND PROJECT REVISIONS

A. Overview.

1. The non-governmental parties agree to propose programmatic and permit actions to implement a new vision for the DuPont shoreline. That vision would serve both public and private interests by protecting the environment and providing a location for water shipment of the aggregate resource found in DuPont. The location of the sand and gravel barge

transshipment facility would be moved northward near Tatsolo Point, approximately 1.5 miles farther away from the Nisqually National Wildlife Refuge than is the existing dock. WRECO and Lone Star would abandon all plans to use the existing DuPont dock as a commercial shipping facility, and the area would be available to the public for shoreline access and passive recreational uses consistent with a Conservancy designation. In addition to these mitigation measures, additional mitigation would be provided as set forth in Section II below.

2. The parties recognize that a number of programmatic and permit-specific actions will be required to implement the new vision for the DuPont shoreline. Those actions include: the programmatic actions of a Shoreline Master Program amendment and a DuPont Comprehensive Plan Update; revised project applications; and for all actions compliance with the State Environmental Policy Act ("SEPA"). This Agreement sets forth a process by which each of these programmatic and project-specific components will be undertaken.

a. The specific agreements regarding amendments to the Shoreline Master Program are set forth in Section I.B.

b. The specific agreements regarding the City Comprehensive Plan Update are set forth in Section I.C.

c. The specific agreements regarding revisions to project permits are set forth in Section I.D.

d. SEPA compliance provisions are contained in Section I.E.

e. A critical path containing milestones by which certain key actions are to occur is set forth in Attachment A.

3. The non-governmental parties to this Agreement agree to use their best efforts to obtain all programmatic and project-specific approvals necessary to implement this Settlement Agreement, including but not limited to, providing testimony and letters of support on environmental documents and at public hearings on the proposed Comprehensive Plan Update,

proposed Shoreline Master Program amendments, and project-specific revisions as set forth in this Agreement. The non-governmental parties agree not to challenge any of the programmatic or project-specific approvals granted by private, local, state or federal entities, or any of the environmental documents or decisions issued consistent with this Agreement.

4. The governmental entities agree to consider the programmatic and project-specific proposals in good faith and in accordance with the agreed upon process and schedules set forth in this Agreement, and as set forth in Attachment A.

B. DuPont Shoreline Master Program Amendment.

1. The non-governmental parties agree to actively support an amendment to the DuPont Shoreline Master Program which would accomplish the objectives of this Settlement Agreement. The amendment to the DuPont Shoreline Master Program that will be proposed to accomplish these objectives shall be substantially in the form contained in Attachment B attached hereto and incorporated herein by reference ("Proposed DSMP Amendment"). The Proposed DSMP Amendment will be processed strictly in accordance with the provisions of WAC ch. 173-19. The Proposed DSMP Amendment provides for:

a. A map and text amendment to allow location of a sand and gravel barge transshipment facility in the Tatsolo Point area, by establishing a Special Management Unit or other appropriate shoreline designation that permits those uses described in Section II.B.4 below (hereinafter referred to as the "Special Management Unit"). The sand and gravel barge transshipment facility will be used solely for those uses described in Section II.B.4 below.

b. A map amendment to eliminate the existing Urban shoreline designation near the mouth of Sequalitchew Creek and to redesignate this area as a Conservancy environment. Elimination of the Urban shoreline designation will occur concurrently with the final approval of the Proposed DSMP Amendment as set forth in Attachment B and immediately

prior to the approval of the state and local permits necessary for construction of the sand and gravel barge transshipment facility.

2. The non-governmental parties to this Agreement agree to support the Proposed DSMP Amendment and to work cooperatively towards its adoption by the governmental entities by actions that will include, but are not limited to, letters and testimony in support of the amendment.

3. The City agrees to consider the Proposed DSMP Amendment in good faith, and will submit a final decision to Ecology according to the agreed upon public process and schedules set forth herein and in Attachment A. Ecology and the City will fully comply with the public comment and participation requirements of RCW 34.05 and WAC 173-19.

4. Ecology agrees to consider the City's submittal on the Proposed DSMP Amendment in good faith and according to the agreed upon process and schedules set forth herein and in Attachment A. Ecology will determine whether the City's submittal is consistent with the Shoreline Management Act under Ecology's powers granted to it under the Act.

5. The non-governmental parties agree not to appeal the approval of the Proposed DSMP Amendment if it is approved, provided it is adopted in substantially the form attached hereto as Attachment B.

C. Proposed DuPont Comprehensive Plan Update.

1. The City is currently in the process of updating its Comprehensive Plan pursuant to the requirements of Washington's Growth Management Act.

2. Ecology and the non-governmental parties agree not to oppose the following components of a Comprehensive Plan Update:

a. Shoreline provisions which show an intent to eliminate the existing Urban shoreline designation and establish a Special Management Unit in the Tatsolo Point area

and which would provide for any other details necessary for the Comprehensive Plan to be consistent with the Proposed DSMP Amendment as set forth in Attachment B.

b. Public Access provisions which include a new public access trail down the north side of Sequalitchew Creek that extends ten feet on either side of the center line of the narrow gauge railway (rather than the south side of the Creek as presently shown in the 1985 Comprehensive Plan) to the mouth of Sequalitchew Creek on the Puget Sound shoreline as set forth in Attachment H. The public access area will be available for passive recreational uses consistent with the Conservancy designation.

c. Land Use provisions consistent with the plan for Hoffman Hill prepared by Peter Calthorpe as set forth in Attachment D attached hereto and incorporated herein by reference, which accommodate WRECO's plans for residential development of Hoffman Hill in the future.

d. Mineral Resource Lands provisions including a mineral resource lands designation, which applies to the lands north of Sequalitchew Creek, as designated as the Pioneer Aggregates' Lease Area, as depicted in Attachment C, and policies which meet the requirements of the Growth Management Act and make these lands available for resource extraction under industrial zoning.

3. The City agrees to consider the proposed Comprehensive Plan Update set forth above in good faith and according to the schedules set forth in Attachment A.

D. Revised Project Applications.

1. WRECO and Lone Star agree to seek permits and approvals for a Revised Project, which shall be defined to mean the Pioneer Aggregates Project as approved by City of DuPont Ordinance Nos. 485 and 486, except as modified to relocate the sand and gravel barge transshipment facility in the Tatsolo Point area, together with related relocation of the access road and conveyor system, and as modified to add or remove conditions. The permits and

Section I.D.1 (cont'd.)

approvals sought by WRECO and Lone Star pursuant to this paragraph, shall specifically not include an asphalt plant or concrete plant consistent with the specific deletion of such facilities by the City Council in their approval of Ordinance Nos. 485 and 486. A recordable declaration in the form annexed hereto as Attachment K shall be executed, which shall prohibit use of the Pioneer Aggregates Lease Area for an asphalt or concrete plant for a period of 99 years from the date of execution of this Agreement. An illustrative depiction of the Revised Project is contained in Attachment E. The parties agree that the final location of the Revised Project will be within the City of DuPont and further agree that the dock location will be within the range shown in Attachment B as the location for the Special Management Unit, which the parties agree is outside of the Nisqually Delta shoreline of statewide significance. WRECO and Lone Star are agreeing to no other permit modifications, except those specifically referenced herein. The proposed conceptual drawing set forth in Attachment E shows the maximum physical and visual impact to the bluff contemplated by the parties, and Lone Star will develop alternative plans that minimize visual and physical impacts to the bluff, taking into account concerns regarding noise, safety and cost. The parties recognize that project changes may occur through the engineering, survey, SEPA, and permitting process. The non-governmental parties agree to support any reasonable modifications to the proposal which do not: increase environmental impacts of the Revised Project, substantially change the location and size of the Revised Project, substantially change the feasibility of the Revised Project, or substantially increase the costs of the Revised Project. Measures that minimize environmental impacts and costs may be brought to the attention of the Environmental Review Committee created pursuant to Section I.E below, and the parties will, in good faith, consider inclusion of such measures into the Revised Project.

2. The non-governmental parties agree to support Lone Star's and WRECO's efforts to obtain all necessary permits and approvals for the Revised Project and to solicit support for the Revised Project from various interest groups and governmental entities, including but not

Section I.D.2 (cont'd.)

limited to Fort Lewis, the Corps of Engineers and the Nisqually Tribe. The non-governmental parties agree to use their best efforts to obtain all necessary permits for the Revised Project by the milestones set forth in Attachment A. The non-governmental parties also agree that they will not appeal any programmatic approval or permit approval necessary to implement the Revised Project. This agreement not to appeal any approvals shall include and shall apply to any local, state, or federal environmental document or threshold determination.

3. The City agrees to consider any necessary permits for the Revised Project in good faith and according to the agreed upon public process and schedules set forth in Attachment B. If the City approves any permit for the Revised Project, the City agrees not to challenge any permit or approval granted by another governmental agency which is consistent with their approval.

4. Ecology agrees to consider the proposed permits for the Revised Project in good faith and according to the agreed upon public process and schedules set forth in Attachment A. In the event that the City does not approve any necessary permits for the Revised Project, Ecology will review the decision and determine whether an appeal is appropriate under the powers granted to Ecology by the Shoreline Management Act or other authority. If Ecology approves a permit for the Revised Project, Ecology agrees not to challenge any permit or approval granted by another governmental agency for the Revised Project provided those approvals are consistent with this Agreement.

5. The parties agree that limited surface mining and the processing plant construction can commence at Lone Star's option after execution of this Agreement, pursuant to Ordinance No. 485 independent of any shoreline permit or the pending appeals, provided, no material is removed from the site by barge and further provided that the amount of aggregates removed annually does not exceed the volume equivalent to 20% of the total material which was estimated in the Pioneer Aggregates Final EIS to be mined annually (i.e., the amount of material

Section I.D.5 (cont'd.)

that was to be removed by truck). Ecology has determined that for purposes of this Agreement only, such limited mining activity is not dependent upon any use or development occurring in the shoreline, and is an economically independent activity; provided, however, that this determination shall not be used against any party in the event that litigation of the Underlying Actions (defined at III.A.5) is resumed pursuant to Section I.F(2). The limited mining and truck transport is permitted under City Ordinance Nos. 485 and 486, which include the mitigation measures applicable to this activity. If Lone Star exercises this option, they agree to limit the interim truck traffic to essentially the same hours of operation as the facility located in Steilacoom, which is between the hours of 7:00 a.m. and 7:00 p.m. For this limited surface mining, Lone Star shall provide a semi-annual report to the City and Ecology documenting where and how much aggregate has been removed and any progress in the construction of the processing plant.

6. Proposed mitigation measures for the Revised Project are set forth in Section II, below. The non-governmental parties agree to seek no further mitigation measures beyond those provided therein, unless a measure is agreed to by Lone Star through the process set forth in Section I.E(3)(e) and Section I.D(1).

7. In the event that any governmental agency denies or conditions the Revised Project in a manner inconsistent with Section II of this Agreement, Lone Star and WRECO will have the options set forth in Section I.F below.

E. State Environmental Policy Act Compliance.

1. The Comprehensive Plan Update SEPA process will proceed independently through the EIS process presently under way in an effort to adopt the Comprehensive Plan Update according to the Growth Management Act deadline. The EIS for the Comprehensive Plan Update will include environmental analysis of the proposed amendments for the Comprehensive Plan Update set forth in Section I.C above.

2. The Proposed DSMP Amendment set forth in Section I.B shall be evaluated in a Supplemental Environmental Impact Statement (SEIS). The SEIS shall discuss the environmental impacts of the proposed Special Management Unit and the elimination of the current Urban shoreline designation. Ecology will investigate the availability of grant monies that may be available to assist the City in programmatic planning and environmental review.

3. The SEIS for the Proposed DSMP Amendment will also consider the environmental impacts of the Revised Project proposal. With regard to the SEIS, the parties agree to the following:

a. Lead Agencies: Ecology will act as a lead agency responsible for the preparation of the environmental review document. The City shall, at its option, be a co-lead agency.

b. Funding and Scope of Work: Lone Star will be responsible for funding the necessary environmental studies, except to the extent grant money is available to the City for analyzing the Proposed DSMP Amendment. Ecology will use best efforts to complete the environmental review for the Revised Project within reasonable cost limits. The Environmental Review Committee will prepare a proposed scope of work and budgetary goals for the SEIS and submit them to Ecology for its approval within 45 days from the effective date of this Agreement. The SEIS will analyze (1) the Proposed DSMP Amendment and reasonable alternatives to accomplish its objectives, and (2) the elements of the Revised Project not previously analyzed in the Pioneer Aggregates Final EIS, and reasonable alternatives that would accommodate the sand and gravel barge transshipment facility, conveyor, and access road elements on property owned or controlled by WRECO or Lone Star.

c. Milestones: The parties agree to use best efforts and act in good faith to meet the milestones set forth in Attachment A. Remedies for missing certain Key Milestones are set forth in Section III.A.2 below.

d. Staff: Ecology agrees to assign one staff person to facilitate all necessary permits, approvals, and environmental review documents. The staff person should be a full-time employee with Ecology and shall have experience in managing large projects in the south Puget Sound region. The Ecology staff person shall also work on the Master Program amendment, and any other activities, including meeting with other agencies as necessary.

e. Environmental Review Committee: To coordinate the efforts of the parties during the SEPA process, an Environmental Review Committee is established with the following representatives of the parties: Ron Summers (Lone Star), Phil White (WRECO), Janet Dawes (NDA), as well as a representative to be named from Ecology, the City, acting through the City Council, and the Anderson Island QOLC. In the event any named designee cannot serve, the affected party shall name a new representative. The Environmental Review Committee will convene upon request of Ecology when Ecology desires input on an aspect of the SEPA process. The Environmental Review Committee may also consider measures to reduce environmental impacts or costs as set forth in Section I.D(1). The parties will in good faith consider measures recommended by the Committee for changes to the project and Ecology will consider whether the suggested measures warrant inclusion in the SEIS according to the SEPA Rules.

f. Consultants: Ecology shall use best efforts to provide environmental analysis in-house. Where necessary, outside consultants will be selected by Ecology, after consultation with the City and the Environmental Review Committee. Where possible, consultants with previous experience on the Pioneer Aggregates Final EIS will be used, with the exception of a new noise study conducted in accordance with Section I.E.3.g below.

g. Cooperative Noise Compliance:

(i) The existing measured Ldn at the eastern shore of Anderson Island, as measured at the water-side lawn of the Robert Moore residence at Cole Point, as representative of the homes in the area, shall not increase by more than 5 dBA as a

result of the Revised Project. This standard shall be referred to as the Noise Standard. In addition, even if the Noise Standard is met, Lone Star will undertake reasonable mitigation measures, excluding modifying operating hours, to reduce noise impacts further below the Noise Standard.

(ii) The parties agree that moving the sand and gravel barge transshipment facility north near Tatsolo Point constitutes mitigation for potential noise impacts of the Revised Project upon the Nisqually NWR and the City of DuPont.

(iii) The parties agree upon the following method as the most efficient, fair and enforceable manner by which to ensure that the Revised Project does not have a significant noise impact: 1) The parties agree to the Noise Standard set forth in subparagraph (i) above as the appropriate noise limit for the Revised Project with regard to Anderson Island; 2) The parties agree that the only additional study necessary to implement this standard is to establish a baseline Ldn at the eastern shore of Anderson Island to serve as a basis for monitoring; 3) The parties agree to use an independent noise consultant to measure the existing Ldn at Cole Point on Anderson Island for use as the baseline; 4) A "Cooperative Noise Compliance Committee" (CNCC) shall be formed to adopt the baseline and develop a Monitoring Program, to be implemented by an entity selected and managed by the CNCC; and 5) Following start up of operations of the Revised Project and implementation of monitoring, the CNCC will reconvene to develop a Mitigation Plan only if monitoring under the Monitoring Program establishes that the Noise Standard has been violated.

(iv) The CNCC shall be comprised of one representative from Lone Star, WRECO, Ecology, the City, NDA, and the Anderson Island QOLC. Any party, at its option, may be represented by a person with experience in noise issues. The CNCC shall work on a consensus basis. The responsibilities of the CNCC shall include overseeing and reviewing the noise consultant's work; adopting the Anderson Island baseline against which the Noise

Standard will apply; identifying mitigation measures, excluding modification of operating hours, to reduce noise impacts further below the Noise Standard; developing a Monitoring Program, using as a basis the draft monitoring plan attached to City of DuPont Ordinance No. 486; reviewing monitoring reports; and, only if the Monitoring Program establishes that violations of the Noise Standard have occurred, developing a Mitigation Plan for the Revised Project, which may include modification of operating hours, to meet the Noise Standard.

(v) The Greenbush Group is accepted by all parties as the Noise Consultant.

(vi) The Monitoring Program to be developed shall provide for independent monitoring and reporting to the CNCC, to be provided on a timeline agreed upon by the CNCC.

(vii) The CNCC may, at its option, commence efforts prior to final acceptance of this Agreement by all parties.

(viii) Ecology shall appoint a contract administrator who shall be responsible for entering into the contract with the consultant selected by the CNCC.

(ix) Funding for the noise consultant contract will be provided for in the SEIS. Lone Star will be responsible for funding noise monitoring under the Monitoring Program.

(x) In the event that the parties cannot agree to any element of the noise program developed herein or by the CNCC, or in the event that the parties cannot agree to a Mitigation Plan following any violation of the Noise Standard established under the Monitoring Program, the parties shall employ the dispute resolution process established in Section III.B.1 of this Agreement.

h. Fiscal Study. Lone Star is committed to contribute its fair share to needed City services that may increase as a result of the Pioneer Aggregates Project

Section I. E.3.h (cont'd.)

being situated in the City of DuPont. The fiscal analysis provided in the Final Environmental Impact Statement dated February 4, 1993 is being reviewed, and a revised report will be included in the project-specific SEPA review for the Revised Project as necessary.

4. The parties agree that preparation of the SEIS is being done because of a proposed Shoreline Master Program Amendment and a proposed Revised Project, and therefore its preparation shall in no way be used to attack the adequacy of the original EIS documents for the Pioneer Aggregates Project.

F. Process Facilitation and Remedies.

1. To facilitate implementation of this Settlement Agreement, including the processing of all necessary permits and approvals, the State will create an Inter-Agency Task Force. The Inter-Agency Task Force will include members from Ecology, Department of Natural Resources, the Washington Department of Wildlife and Fisheries, and any other agency deemed appropriate by Ecology. The Task Force shall use its best efforts to minimize delays, and provide coordination and technical assistance as necessary to facilitate the programmatic and permit review processes.

2. The parties agree not to appeal any programmatic or project-specific approvals granted which are consistent with this Agreement. If all permits and approvals are obtained and no permit appeals are filed, the Revised Project will be built and the Underlying Actions will be dismissed pursuant to Section III.A. If, however, any necessary programmatic or permit-specific approval is not obtained, or any permit is appealed by anyone, then Lone Star and WRECO may opt to continue to pursue the approvals for the Revised Project through the appeals process, but if this is not a satisfactory option to Lone Star and WRECO, they may, at their sole discretion, opt to defend the original permit approvals obtained by Ordinance No. 485 and Ordinance No. 486; provided that WRECO and Lone Star need not abandon one appeal option to

Section I.F.2 (cont'd.)

pursue the other. These litigation options remain open to WRECO and Lone Star until the consolidated shorelines appeals are dismissed pursuant to Section III.A.3 of this Agreement, and the Pierce County appeal is dismissed pursuant to Section III.A.4. In the event Lone Star and WRECO opt to pursue the Revised Project through the appeals process, the non-governmental parties agree to support WRECO and Lone Star in any appeals brought to obtain such permits. In the event Lone Star and WRECO opt to defend and pursue the original City approvals obtained, then the other parties reserve all rights to pursue their opposition to those original approvals.

II. MITIGATION

A. Overview.

1. Lone Star and WRECO agree to undertake the mitigation measures expressly set forth in this section, provided, however, that all mitigation measures are expressly contingent upon Lone Star's receipt of all necessary permits and approvals to implement all aspects of the Revised Project on acceptable terms and upon the expiration of all appeal periods with no appeals being filed. If a permit appeal is filed in connection with the Revised Project by anyone, then WRECO and Lone Star will have the options set forth in Section I.F(2). If Lone Star and WRECO successfully defend the permits and opt to proceed with the Revised Project, then they will undertake the additional mitigation set forth below, except that contributions to the mitigation fund may be reduced as set forth below.

2. The parties agree that the mitigation measures herein are adequate to mitigate all direct and indirect impacts of the Revised Project. The parties recognize further mitigation measures may be suggested and implemented through the processes set forth in Section I.D(1), I.E(3)(e) and II.B(4).

B. Additional Mitigation Measures.

1. Public Access Plan. WRECO and Lone Star agree to the following public access provisions:

a. WRECO agrees to dedicate to the City an area for public trail access along the existing narrow gauge rail on the north side of Sequalitchew Creek to the Puget Sound shoreline in the vicinity of the existing dock, as shown on Attachment H.

b. Public access will not be provided by Lone Star or WRECO at the new sand and gravel barge transshipment facility; a public access route will be set aside down the north side of Sequalitchew Creek to the Puget Sound Shoreline area in the vicinity of the existing dock. WRECO agrees to remove the existing DuPont dock structure from the aquatic lands upon completion of the construction of the new gravel dock or, at WRECO's option, earlier. Alternatively, at the request of the State, WRECO will turn over all right, title, and interests in the dock to DNR. WRECO agrees to forego future normal maintenance and repair of the dock structure during the pendency of the permitting and new dock construction process, provided the parties agree not to use any future deterioration of the dock structure against WRECO in the event that appeal proceedings of SHB No. 93-69 are resumed.

c. Lone Star and WRECO, in cooperation with Ecology, agree to place educational signs and native vegetation adjacent to the trail in the location of the salt marsh to educate the public and discourage physical intrusions into the marsh area.

2. Hoffman Hill.

a. WRECO agrees to establish a buffer on Hoffman Hill as shown by the green area on the map in Attachment D, subject to a record survey. The buffer shall be established through the imposition of an easement. At the time development occurs adjacent to the buffer, WRECO will dedicate the buffer to the City. The parties acknowledge that the agreed upon setback and buffer set forth in Attachment D is sufficient to protect bluff stability, as well as to mitigate impacts from Hoffman Hill residential development on bluff habitat and its wildlife, and the resources associated with the viewshed from the Nisqually National Wildlife

Refuge. Ecology agrees to consider this mitigation as part of any mitigation package which may be required for the residential development of Hoffman Hill after environmental review.

b. The easement, known as a Native Growth Protection Easement (NGPE), will convey to the public a beneficial interest in the land within the easement. This interest includes the preservation of native vegetation for all purposes that benefit the public health, safety, and welfare, including, but not limited to, control of surface water and erosion, maintenance of slope stability, visual and aural buffering, and protection of plant and animal habitat. The NGPE imposes upon all present and future owners and occupiers of land subject to the easement the obligation to leave undisturbed all trees and all other vegetation within the easement, provided, that a public access trail consistent with the Calthorpe Plan, including access to the two existing public view points, and appurtenances necessary to use the trail and viewpoints, such as handrails at the view points, may be constructed in the easement. Obligations under the easement are enforceable on behalf of the public by the City of DuPont, and, if the City is provided written notice of an alleged violation and fails to take action within 30 days of such notice, the easement is enforceable by NDA and Ecology. The easement shall provide for liquidated damages in the amount of $5,000 for each tree cut in excess of 12 inches dbh or for clearing more than 1,500 square feet of brush, and $2,500 for trimming any tree or for each tree cut smaller than 12 inches dbh or for clearing less than 1,500 square feet of brush. The easement shall also provide that if litigation is necessary to enforce the terms of the easement, the prevailing party shall be entitled to its attorney's fees and costs. Prior to the sale of lots adjacent to the buffer, WRECO shall inform in a conspicuous manner prospective purchasers of the buffer's status as an NGPE and that protection of the NGPE buffer will be enforced by the City. WRECO will obtain written acknowledgment from the purchasers that they have received such notice and that they consent to be subject to the terms of the easement including that the purchaser agrees to give the same notice on the same terms to subsequent purchasers. The notice

Section II.B.2.b (cont'd.)

shall also be filed with the Pierce County Auditor's Office prior to or at closing of the sale. Failure to provide any such notice will result in liquidated damages of $5,000 against the person required to give such notice. All liquidated and unliquidated damages shall be payable to the City for restoration and improvements to the buffer, provided that when NDA and Ecology enforce the agreement, that party's attorney's fees and costs shall be payable from the damages collected.

c. Permanent survey stakes and signs shall be set delineating the buffer prior to WRECO selling the property or receiving approval for any development or pre-development activity on Hoffman Hill. Before beginning and continuously during the course of any grading, building construction, or other development activity on a lot subject or adjacent to the NGPE, the common boundary between the easement and the area of development activity must be fenced or otherwise continuously marked in a highly visible manner, such as yellow caution tape, to the satisfaction of the City. At the time that roads are constructed on the site, one sign per lot shall be posted, or other physical notice mutually agreed upon by Ecology, NDA, WRECO, and DuPont shall be provided, at the boundary between the buffer and each adjacent private lot alerting subsequent occupiers and users of the land to the existence of the buffer and the need to protect it. The signs shall be similar to the example attached hereto as Attachment I. The message on the sign shall be modified appropriately.

d. Ecology, the City and the nongovernmental parties agree not to seek any buffer proposal for Hoffman Hill that is inconsistent with the Calthorpe Plan shown in Attachment D; provided, however, this shall not apply to environmental impacts from future development which are unrelated to the Nisqually National Wildlife Refuge and which may be disclosed in subsequent environmental review. The parties agree not to propose any plan calling for public acquisition of Hoffman Hill for expansion of the Refuge unless such plan is conditioned on WRECO being a willing seller entitled to full fair market value and upon

approval of the City. Nothing contained in this section shall be construed as limiting or prohibiting the City from exercising its rights to acquire by eminent domain, all or any portion of the Hoffman Hill area for a public purpose other than the expansion of the Refuge.

e. Additional Mitigation Provisions Regarding Hoffman Hill.

(i) The public access trail provided for herein shall be designed and constructed by WRECO, its successors or assigns, subject to approval by the City of the plans and specifications therefor;

(ii) The design for the trail shall include reasonable accommodation to meet the requirements of the Americans with Disabilities Act.

(iii) If the City so elects, it may design and construct the trail and charge WRECO the reasonable costs thereby incurred. In such event, WRECO shall have an opportunity for design input and shall be credited in such amount against the costs of any recreational improvements which it might be reasonably required to install as a part of residential platting or development in the City. Any City employee who will be working on the trail project will be required to have credentials for this type of construction project.

(iv) Removal by the City or by WRECO with the City's permission, of trees and undergrowth in conjunction with trail construction or maintenance, or the removal by either party of dangerous trees near the trail or public viewpoints, shall not be deemed a violation of any provision of this Agreement.

(v) The City may by ordinance provide that it shall be a civil offense, enforceable in Municipal Court, for any person to remove, without permission from the City, brush, trees, or other growth from the Native Growth Protection Easement except as provided in the preceding subparagraph iv.

(vi) The design for the trail shall include public access thereto from a public right-of-way.

3. New Dock. Upon receipt of all necessary permits for the Revised Project, and the expiration of all applicable permit appeal periods with no appeals being filed, Lone Star agrees to construct a new gravel transshipment facility in the Tatsolo Point area. The new gravel dock will be smaller than the existing DuPont dock and will be sized to handle barging of sand, gravel, and related construction materials originating from or for use with materials from the DuPont site in connection with Lone Star's business only, and will not be oversized to handle future uses or any other commodities. The dock structure will not contain any creosote pilings. Grated decking will be used in the near-shore environment.

4. Concurrent and Future Use. WRECO and Lone Star agree that use of the new dock shall be for barge loading of sand, gravel, and related construction materials originating from or for use with materials from the DuPont site and shall be used for no other concurrent purpose while the dock is used as a sand and gravel barge transshipment facility. At the conclusion of mining operations in the City, Lone Star and WRECO agree to limit proposed future uses, if any, of the Special Management Unit to development of no greater size or impacts than the sand and gravel barge transshipment facility built for the Revised Project. The parties recognize and agree that at the conclusion of the 25-year payment period set forth in II.D.(1) below, the parties may seek and negotiate further environmental mitigation funding for environmental impacts due to the sand and gravel barge transshipment facility. The term "related construction materials" as it is used in this paragraph is intended to refer to glass, shredded rubber, or other additives required or recommended by any agency of the State of Washington or the United States to be included in sand or gravel. It shall not be deemed to include asphalt.

5. Shoreline Uses. Lone Star and WRECO agree to limit future use, if any, of the remaining DuPont shoreline outside of the Special Management Unit to non-industrial uses consistent with the Conservancy regulations of the existing DuPont Master Program. The permits obtained by Lone Star do not provide for any mining within 200 feet of Puget Sound or

Section II.B.5 (cont'd.)

Sequalitchew Creek. WRECO and Lone Star agree to seek no permits in the future to mine within the shoreline jurisdiction as defined by RCW Chapter 90.58, or within 100 feet of the top of the bank of Sequalitchew Creek, as shown on Exhibit J, or in a manner that would significantly impact the flow of Sequalitchew Creek. This shall not prohibit excavation for construction of the sand and gravel barge transshipment facility.

C. City Fiscal Mitigation Fund.

1. Lone Star and WRECO will pay $1,000,000 to the City of DuPont to compensate for any direct or indirect impacts of the Revised Project, including potential negative fiscal impacts of the site plan approval as referenced in Condition No. 99 to Ordinance No. 485, and in Condition No. 52 of Ordinance No. 486.

2. The $1,000,000 payment to the City by Lone Star and WRECO, referred to at Section II.C.2 above, will be made in a single lump sum at such time as mitigation is due under Section II.A. This payment is not to be deemed to be in lieu of or a substitute for any other mitigation required under Ordinance Nos. 485 or 486. Such payment is not intended to fund or to reimburse the City for the costs of studies required for development approvals, nor for enforcement of the terms of any such approvals for the Revised Project.

3. Lone Star and WRECO will also reimburse the City for the following:

a. The City's reasonable expenses in arriving at this agreement, including legal fees and disbursements of the City attorney and also legal fees and disbursements incurred by the City for independent legal review and consultation;

b. The City's reasonable expenses in connection with the review process for the Revised Project, including all legal fees and disbursements;

c. The City's expenses, if any, incurred in defense of any appeal of any process or permit relating to the Revised Project where the City is a party; provided that this provision shall not apply to such expenses if incurred by the City related to an appeal filed by the

Section II.C.3.c (cont'd.)

City from an approval received by WRECO or Lone Star from another governmental agency, nor shall it apply to any action brought by Lone Star or WRECO.

d. The fees, expenses and costs referred to in the preceding subparagraphs a through c will be payable whether or not the Revised Project is ultimately approved, and if approved whether or not it is abandoned in whole or part by WRECO or Lone Star.

4. In the event the City does not approve any necessary programmatic approval or permit for the Revised Project, Lone Star and WRECO may proceed as provided in Section I.F above, and shall have no obligation to the City under this Settlement Agreement.

D. Environmental Mitigation Funding.

1. Environmental Mitigation Trust. As a further mitigation measure, Lone Star and WRECO agree to make a grant to an Environmental Mitigation Trust ("EMT"), which will undertake acquisition of real property, development rights and easements as resource protection measures for the Nisqually Delta, in the area described as the Mitigation Landscape Area as defined in Section II.D.2.b. below. The EMT shall be a public or non-profit entity such as the Trust for Public Lands, the Nature Conservancy, or the Nisqually Land Trust, which shall be selected jointly by the NDA and Ecology.

2. Funding. Lone Star and WRECO agree to contribute to the trust designated pursuant to Section II.D.1 above, a grant payable as follows:

a. A down payment will be payable within 30 days after all permits necessary for the Revised Project have been issued, and all appeal periods for those permits have expired with no appeals being filed or alternatively any permits challenged are affirmed following appeal. The down payment shall be in the amount of $375,000. An additional $125,000 shall be payable on January 31, 1996, conditioned upon all state and local permits and approvals having been obtained by that date, and further conditioned upon all non-programmatic

permit and approval appeals periods having expired by that date with no appeal being filed or all appeals filed being fully resolved in Lone Star's and WRECO's favor by January 31, 1996.

b. The balance will be payable in annual installments of $50,000 per year for 25 years; provided, however, that if for any reason the aggregate operations have been suspended totally for six months or more, annual payments will be suspended until any portion of the aggregate operation is resumed. The first annual installment will be due upon completion of construction of the sand and gravel barge transshipment facility; for years 2 through 25 of operations of the Revised Project, the annual payment shall be due on June 29 unless the due date is modified pursuant to the suspension proviso in the preceding sentence. Payments in years 6 through 25 shall be adjusted for inflation according to the Producer Price Index for sand and gravel. The base year for inflation adjustments shall be the year that operations of the Revised Project commence. At Ecology's or NDA's option, the sum total of payments for years 21 through 25 may be accelerated to the time of or anytime after the down payment, if that sum total is contributed toward purchase of real property, development rights, or easements, in the Mitigation Landscape Area. The Mitigation Landscape Area shall be defined as:

(i) The Shoreline of Statewide Significance (as defined in the Shoreline Management Act) from Tatsolo Point south to De Wolf Bight, the Nisqually National Wildlife Refuge, and all areas contiguous to these lands, excluding those lands within the City limits of DuPont, and extending no further south or east than the I-5 freeway corridor; provided that land within the current city limits of DuPont may be included to the extent that it can be purchased from a willing seller. No portion of this geographic area shall be included to the extent that it is either urbanized or a disturbed natural environment that is unsuitable for natural habitat and for which a plan and funding for restoration of the habitat has not been identified.

(ii) In the event that the trustee determines that the protection of the natural environment of the Mitigation Landscape Area by purchase of the stated property

interests in the above-stated geographic areas has been completely frustrated or cannot be achieved, the Mitigation Landscape Area may be expanded to include shorelands and adjacent property associated with any river, stream or wetland that is associated with and forms an integral part of the ecology of the Nisqually Delta, subject to the limiting provision applicable to land within the current city limits of DuPont, as set forth in subparagraph (i) above.

c. If any necessary permit is denied or appealed, then Lone Star and WRECO may exercise their options under Section I.F. If they opt to pursue the Revised Project, are successful in obtaining the permits for it through the appellate process, and elect to build the Revised Project, then Lone Star and WRECO will fund the annual payments and the down payment, but will have no obligation to make the conditional January 31, 1996 payment unless all permit appeals or challenges to permit denials are fully resolved in Lone Star and WRECO's favor by January 31, 1996.

III. GENERAL TERMS

A. Disposition of Existing Litigation and Applications.

1. Appeals Stayed. The shoreline appeals (SHB Nos. 93-64, 93-65, and 93-69) and Pierce County appeal (Pierce County Cause No. 93-2-09515-1) shall be stayed and held on inactive status pending the outcome of the programmatic and permit-specific approval processes set forth above. The parties to the appeals will execute a Stipulation and Order of Continuance for the shoreline appeal and Pierce County Superior Court appeal concurrently with the execution of this Settlement Agreement. The parties to the appeals hereby authorize and direct their respective attorneys of record to sign and file the Stipulation and Order of Continuance upon execution of this Settlement Agreement by the parties of record to the appeals.

2. Key Milestones. Certain Key Milestones contained in Attachment A are marked by an asterisk (*). If any Key Milestone in Attachment A is not completed within two weeks of the target date, or if any necessary programmatic or permit-specific approval is not

obtained consistent with this Agreement, Lone Star and WRECO may exercise their options under Section I.F.2 above.

3. Dismissal of Shoreline Appeals. The parties to this agreement who are parties of record to the shoreline appeals hereby authorize and direct their respective counsel of record to execute and file the Stipulation and Order of Dismissal for Consolidated Cases SHB Nos. 93-64, 93-65, and 93-69 substantially in the form attached hereto as Attachment F, and incorporated herein by this reference, when the following conditions are met: 1) all necessary permits and approvals are obtained for the Revised Project; and 2) the appeal period for the last necessary project-specific approval or permit to issue has run with no programmatic or project-specific appeal having been filed. Lone Star and WRECO further agree that, upon completion of construction of the new dock, they will withdraw the permit applications for use of the existing DuPont dock.

4. Dismissal of Pierce County Appeals. Parties to this agreement who are parties of record to Pierce County Superior Court Cause No. 93-2-09515-1 hereby authorize and direct their respective attorneys of record to execute and file the Stipulation and Order of Dismissal substantially in the form attached hereto as Attachment G, and incorporated herein by this reference, when the following conditions are met: 1) all necessary permits and approvals are obtained for the Revised Project; and 2) the appeal period for the last necessary project-specific approval or permit to issue has run with no programmatic or project-specific appeal having been filed; provided it is agreed that, in the event this litigation is resumed, it shall not be a basis for challenging in any way the construction of the processing plant or mining of the material moved by truck pursuant to Section I.D.5 above.

5. Mutual Release. Effective upon the date of dismissal with prejudice of the last of the following iterated actions to be dismissed, SHB No. 93-64, SHB No. 93-65, SHB No. 93-69, and Pierce County Superior Court Cause No. 93-2-09515-1 (together the "Underlying

Actions"), the parties release and forever discharge each other and their officers, directors, shareholders, employees, representatives, agents, successors, and assigns, from any and all causes of action, claims, damages, liabilities, and demands of any nature whatsoever, arising out of or relating in any way to the allegations made in the Underlying Actions or in retaliation for any activities by the parties relating to their opposition to the originally permitted project.

B. Other Terms

1. Dispute Resolution and Enforcement. This Agreement is enforceable by any party to the Agreement. Prior to raising by motion, complaint or other legal proceeding any alleged violation of this Agreement or any alleged failure to perform any obligation imposed hereby, the aggrieved party shall first consult with the other parties consistent with the procedure outlined in Rule 26(i) of the Washington Superior Court Civil Rules, and, in the event the matter cannot be resolved, confirm such consultation in written correspondence to the alleged breaching party. If no agreement can be reached within 10 days from receipt of the letter, the parties will then submit the dispute to Washington Arbitration and Mediation Services or other agreed upon mediator for mediation first, and if that does not resolve the issue, then the parties may submit the dispute to binding arbitration or pursue any other remedies available by law.

2. Authority to Sign. Each of the parties signing this Agreement is legally authorized to enter into the terms and conditions of this Agreement and Stipulation and Orders of Dismissal of proceedings, and is authorized to legally to bind such parties thereto.

3. Agreement Binding. The provisions of this Agreement and the Stipulations and Orders of Dismissal shall apply to and be binding upon the parties hereto and their respective officers, directors, employees, agents, non-governmental attorneys, affiliates, wholly-owned subsidiaries, successors, and assigns.

4. Choice of Law. This Agreement shall be governed by and construed in accordance with the laws of the State of Washington.

5. Modification. This Agreement may be modified only by the express written agreement of all the parties.

6. Counterparts and Effective Date. This Agreement may be executed in counterparts and each executed counterpart shall have the same force and effect as an original instrument upon the effective date of the Agreement. This Agreement shall become effective as to all parties upon the date of signature of the party last in time to sign. The prior circulated agreement dated June 29, 1994 is replaced by this Agreement and shall have no force or effect.

PROPOSED DSMP

FOR SETTLEMENT DISCUSSION PURPOSES ONLY

July 11, 1994

Tatsolo Point Special Management Unit

I. Purpose

The purpose of the Tatsolo Point Special Management Unit is to ensure that the shoreline resources of the Special Management Unit and the shoreline of statewide significance associated with the Nisqually Delta are protected while providing the City of DuPont with a location for access to Puget Sound for appropriate water dependent uses and activities and water related passive recreational uses and activities.

II. Policy

The Special Management Unit is located outside the shoreline of statewide significance. Development within the Special Management Unit should not be visible from anywhere within the Nisqually National Wildlife Refuge.

Uses in the Special Management Unit should be limited to water dependent uses and water related passive recreational uses. Water dependent uses should be limited to those uses associated with public transportation or with sand and gravel barge transshipment. Uses directly associated with the railroad may be allowed, provided that no feasible non-shoreline location is available.

All uses and activities should be designed, developed and conducted in a manner that minimizes the impact to: the natural and human environment; the aesthetic character of the area; and the public use and enjoyment of the area. Appropriate offsetting mitigation should be required for all unavoidable adverse impacts associated with permitted development.

Passive recreational uses and an industrial use may occur concurrently within the Tatsolo Point Special Management Unit. However, only one industrial use utilizing one dock may be permitted and operating within the Tatsolo Point Special Management Unit at any time.

III. Use Regulations

A. Permitted Uses: The following uses and activities are permitted within the Special Management Unit subject to compliance with the development standards contained in Section IV below:

- Passive recreational uses.
- Facilities associated with such passive recreational use, such as parking and restrooms, that are located landward of the ordinary high water mark.
- Fish and wildlife related research activities and developments.
- Fish and wildlife related natural resource enhancement activities and developments.
- Roads and railroads when located landward of the ordinary high water mark.
- Utilities when located landward of the ordinary high water mark.

B. Conditional Uses: The following uses and activities may be allowed only upon approval of a conditional use permit subject to compliance with the conditions of Section IV below:

- Facilities associated with passive recreational use that are located waterward of the ordinary high water mark.
- Aquaculture facilities and uses except when such facilities are for fish and wildlife related research and/or enhancement as provided in the Subsection A above.
- Utilities when located waterward of the ordinary high water mark.
- Roads and railroads when located waterward of the ordinary high water mark.
- Facilities for the loading and unloading of passengers and/or vehicles carried by ferry.
- Train station provided that the facility is located landward of the ordinary high water mark.

- Facilities for the barge shipment of sand and gravel, including such uses as a pier, a dock, mooring dolphins, mooring buoys for barge staging, a barge loader, a conveyor, necessary utilities, and an access road.

- Necessary accessory or ancillary uses of a commercial or industrial nature associated with a listed permitted or conditional use where the need for a shoreline location is fully demonstrated.

- Necessary shoreline stabilization activities associated with existing or proposed uses.

- Maintenance dredging may only be authorized provided that it is fully demonstrated that there is no feasible alternative that will have less environmental impact than the proposed dredging.

- Industrial facilities that are fully demonstrated to have less adverse impact to the natural and human environment than a sand and gravel barge transshipment facility that may be permitted within the Special Management Unit.

C. Prohibited Uses: The following uses are expressly prohibited in the Tatsolo Point Special Management Unit:

- All uses and activities not specifically listed above as permitted or conditional use.

- More than one industrial use within the Special Management Unit.

- More than one industrial dock within the Special Management Unit.

IV. Development Standards

In order to ensure that all uses and activities within the Special Management Unit minimize adverse impacts to the natural and human environment; the aesthetic character of the area; and the public use and enjoyment of the area, the following regulations and development standards apply:

- The footprint, shadow and disturbed area caused by a development or associated construction shall be the minimum necessary to accomplish the authorized use, and shall not be oversized to accommodate speculative future uses.

- All structures shall be designed and constructed to blend visually with the background as viewed from the water, unless the applicant fully demonstrates a need otherwise. Development shall to the maximum extent practicable avoid visibility from the Nisqually National Wildlife Refuge and shall minimize any unavoidable impacts to visibility from the Refuge while accomplishing the intended purpose of the permitted development.

- No dock may extend waterward more than 255 feet from the ordinary high water mark.

- The height of all structures shall be the minimum necessary to accomplish the permitted activity. Height shall be measured from mean higher high water if the structure is over water and from above average grade level if over land. Unless the applicant fully demonstrates a need otherwise, the following height limitations apply:

  a. Any dock and associated structure: 35 feet

  b. Any barge loading tower: 65 feet

  c. Any conveyor structure: maximum 35 feet above the railroad tracks.

- Lighting shall be the minimum necessary for the permitted purpose. Lighting shall be designed and constructed to minimize lighting of the shoreline, upland, and water areas and to minimize visibility from shoreline, upland, and water areas. Lighting shall meet applicable safety standards.

- Alteration and disturbance of the existing bathymetry, land contours, and upland and aquatic vegetation within shoreline jurisdiction shall be minimized.

- Any industrial use or activity shall be located to minimize interference with tribal fishing.

- Obstruction and interference with recreational and commercial navigation and use of the water and shoreline areas shall be minimized.

- Dredging for the creation of berthing areas is prohibited. Berths shall be located to minimize the potential for maintenance dredging. Maintenance dredging may be authorized only by conditional use permit provided that the applicant fully demonstrates that there is no feasible alternative that will have less environmental impact than the proposed dredging.

- Shoreline stabilization activities shall only be authorized when the applicant fully demonstrates that: the stabilization design and method used is compatible with and uses the natural shore processes and conditions present on the site to the greatest extent possible; and that the materials used are compatible with the natural conditions of the site.

- No aquatic or upland vegetation within shoreline jurisdiction shall be disturbed or removed nor any land form altered except as authorized by the specific terms of a shoreline permit.

- Compensatory mitigation shall be provided for all identified adverse impacts to the human and natural environment. This shall include mitigation for impacts caused by the ongoing operation of any use or activity and potential impacts caused by accidents.

DECLARATION RESTRICTING USE OF PROPERTY

THIS DECLARATION is made this ____ day of _____, 1994 by WEYERHAEUSER REAL ESTATE COMPANY, a Washington corporation ("Declarant").

RECITALS

A. Declarant is the owner of certain real property located in the City of DuPont, in Pierce County, Washington, more particularly described on the attached Exhibit A which is referred to herein as the "Property."

DECLARATION

1. Declaration of Restriction. Declarant hereby declares and impresses a covenant on the Property for a period of ninety-nine years from December 25, 1994, prohibiting construction of an asphalt plant or concrete plant anywhere on the Property.

2. Duration. For ninety-nine years, this Declaration shall run with and bind the Property, and shall inure to the benefit of and shall be enforceable by the City of DuPont to the extent provided by law. This Declaration is binding upon the Declarant's legal representatives, heirs, successors, and assigns. Every purchaser or grantee of any interest (including, without limitation, a security interest) in the Property, by acceptance of a deed or other conveyance therefor, thereby agrees that this Declaration is binding upon their use of the Property for the duration of the ninety-nine year period described above.

EXECUTED the day and year first above written.

LEGAL DESCRIPTION OF DECLARANT'S PROPERTY

THAT portion of Sections 22 and 23, Township 19 North, Range 1 East, W.M., Pierce County, Washington, more particularly described as follows:

BEGINNING at the Southeast corner of said Section 22;

THENCE along the South line of said Section 22,
N 87°49'38" W, 457.99 feet to the centerline of Sequalitchew Creek;

THENCE along said centerline, the following bearings and distances:

N 13°28'38" W, 129.14 feet;
N 41°18'14" W, 71.97 feet;
N 29°10'44" W, 239.19 feet;
N 34°50'25" W, 282.11 feet;
N 51°48'54" W, 221.02 feet;
N 55°46'05" W, 226.00 feet;
N 79°32'49" W, 267.29 feet;
N 62°09'45" W, 257.03 feet;
N 52°28'56" W, 257.90 feet;
N 36°30'27" W, 150.34 feet;
N 45°47'01" W, 43.05 feet;
N 29°18'46" W, 131.07 feet;
N 74°09'12" W, 73.54 feet;
N 70°33'10" W, 201.30 feet;
N 42°11'19" W, 83.69 feet;
N 52°39'53" W, 105.03 feet;

N 62°16'24" W, 483.82 feet to the Southeasterly Right-of-Way margin of the Burlington Northern Railroad;

THENCE Northeasterly along said Southeasterly Right-of-Way margin, the following bearings and distances:

N 35°15'30" E, 259.82 feet to a point of curvature;

Northeasterly 489.60 feet along the arc of a tangent curve to the right, having a radius of 4197.28 feet, through a central angle of 06°41'00" to a point of tangency;

N 41°56'30" E, 227.65 feet;
S 87°57'48" E, 156.43 feet;
N 41°56'30" E, 59.37 feet;
N 87°57'48" W, 215.01 feet;
N 02°02'12" E, 34.39 feet;
N 41°56'30" E, 188.14 feet to a point of spiral curvature;

N 41°22'48" E, along the spiral chord, 168.96 feet to a point of curvature;

Northeasterly 654.07 feet along the arc of said curve to the left, having a radius of 2897.93 feet, the radius point of which bears N 49°44'18" W, through a central angle of 12°55'55" to a point of spiral curvature;

N 26°12'42" E, along the spiral chord, 168.96 feet to a tangency;

N 25°39'00" E, 484.70 feet to a point of curvature;

Northeasterly 650.18 feet along the arc of a tangent curve to the right, having a radius of 4264.28 feet, through a central angle of 08°44'09" to a point lying 600 feet South (when measured at right angles from) the North line of said Section 22;

THENCE along a line parallel with and 600 feet South of said North line, S 88°53'04" E, 1253.64 feet to the East line of said Section 22;

THENCE along a line parallel with and 600 feet South of the North line of said Section 23, S 88°53'04" E, 2388.86 feet;

THENCE S 02°06'11" W, 450.07 feet;

THENCE S 88°53'04" E, 200.03 feet;

THENCE S 02°06'11" W, 921.50 feet;

THENCE N 88°24'40" W, 272.74 feet;

THENCE S 47°45'56" W, 1770.31 feet;

THENCE S 16°28'48" W, 2207.74 feet;

THENCE N 88°47'45" W, 500.26 feet to the POINT OF BEGINNING.

See attached Exhibit "X".

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.
I have concerns regarding on the taken down trees and how this will impact the future of our air quality. 1 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
Very concerned regarding the possibility of the ground water being contaminated. 2 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
Will this impact the creek? Cause the creek to be drained or dry up? How will this impact the animals that rely on the creek? 3 DS

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
I have concerns regarding the impact on destroying the environment for the grey squirrel, contaminating of the water impacting the environment for the animals and the people around the site. 4 EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

Highly concerned regarding safety of students crossing center street. Where will access of transportation to site be? Site is too close to school.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

Sequalitchew creek is an environmentally sensitive area. My family and I live here right at the trailhead. We do not want our home to be damaged, destroyed, or exposed to the risks that come with mining including erosion, fire, and drought. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Since my family and I live here I do not want them or myself to be exposed to the potential pollution associated with mining. 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If Sequalitchew creek or the Vashon Aquifer is drained for months out of the year I am extremely concerned about the risk of drought and increased risk of fire in our area.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If Sequalitchew creek or the Vashon aqueduct is drained for months out of the year I am extremely concerned about the risk of drought and increased risk of fire in our area. Furthermore, this area is home to various animals and critters that rely on the water for life. 3 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If Sequalitchew creek or the Vashon aqueduct is drained for months out of the year I am extremely concerned about the risk of drought and increased risk of fire in our area. Furthermore, this area is home to various animals and critters that rely on the water for life. I do not want to displace the wildlife in our area. I do not believe this project is worth it. 4 EA

If you have concerns regarding NOISE, please describe them below.

I do not want our peaceful life interrupted with the noises associated with mining. Please DO NOT proceed with this project. 5 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have concerns regarding the EARTH, please describe them below.

This would be one of the worst things we could do to DuPont. Water is a major resource, we all need to keep as much of it as possible and allowing even the idea of having less of for our community would be devastating to all that share this earth. Once the water is gone we can not replace it. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Our air is polluted enough already. Doing anything to our community to make it worse is a really bad idea. We need more trees and protected wetlands. 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

The above comments are relevant for this box too. We need all the water we have and giving up or allowing it to be taken or used would be devastating for our future as a community and a human race. 3 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

We need to work on keeping pollutants out and preserving not tearing apart or destroying what we have. 4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

I always have concerns about all the above. We all coexist. With out one we don't have the other. Everyone plays a roll. We need to protect the animals, fish, trees etc. 5 EA

If you have concerns regarding NOISE, please describe them below.

I love our peaceful community adding more people or projects with definitely change the atmosphere of our town. The noise, the amount of people causing the noise etc. 6 EA

If you have concerns regarding LAND USE, please describe them below.

The land needs to be protected and kept the way it is or protected wetlands. We have already used so much and cut down so many trees. Imagine how many habitats we have already destroyed. We need to stop now. Nothing will remain. 7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have concerns regarding the EARTH, please describe them below.

This project if approved, will permanently change the natural environment that exists and will due irreparable damage to the area. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

This project if approved, will permanently change the natural environment that exists and due irreparable damage to our community. Many DuPont residents regularly enjoy this area and this project will permanently change the relationship with the environment in a negative way including reducing water levels permanently. 2 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

This project if approved, will permanently change the natural environment that exists and due irreparable damage to our community. Many DuPont residents regularly enjoy this area and this project will permanently change the relationship with the environment in a negative way. Further it will damage the natural habitats of countless animal and plant species native to DuPont. 3 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

This project if approved, will permanently change the natural environment that exists and due irreparable damage to our community. Many DuPont residents regularly enjoy this area and this project will permanently change the relationship with the environment in a negative way. Further, it will be more unnecessary traffic to the area which is often beyond reasonable capacity already.

5 EA

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

As a 20 year resident of DuPont it appears CalPortland continues to attempt to expand their operation at the expense of the groundwater and aquifer. The loss of groundwater will adversely impact vegetation resulting in dry area ideal for brushfires during to hot summer months.

1 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

The lack of fresh water flowing into the marshlands will effect the mix of salt/fresh water balance resulting in loss of plant life and shellfish impacting the food chain for other species at the top.

2 DS EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

Cal Portland's removal of topsoil and trees to obtain aggregate will expose the soil to toxins which will adversely effect the regrowth of trees and other vegetation resulting in further erosion and possible landslides within the area

3 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

As a 20 yr DuPont resident, it has come to my attention that CalPortland wants to expand their mining operations to the detriment of DuPont and would have catastrophic & irreversible effects on our community, environment and wildlife. Dewatering the Vashon Aquifer will have devastating effects on our environment and community and cause the slopes of our beloved Sequalitchew Creek Trail to go dry and vegetation will die as the seeps will be eliminated. The seeps maintain the lush riparian environment and make up the creek flow.

1 DS EA

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Sequalitchew Creek will go dry for approximately five months each year during the hottest part of the year. The City of DuPont has used the Vashon Aquifer as potable drinking water in the past and still has a water right to the aquifer it wants to keep for future growth.

2 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

The water table of West Edmond Marsh will be lowered up to 9 feet. Other wetlands in DuPont will be lowered up to two feet.

3 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Animals will be displaced, as creeks dry up fish will go away, plants will dry up & not to mention that this dry environment highly increases fire danger!

4 EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

Our beloved Sequalitchew Creek Trail
will no longer be the beautiful

5 EA

lush trail that we are all accustomed to and the babbling creek will dry up & be gone, taking vegetation & wildlife with it.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

I am 100% against this mine expansion & draining of the Vashon aquifer for all the reasons above & urge the City of DuPont to NOT approve CalPortland's request.

6

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

I am concerned about the proposed dewatering of Vashon Aquifer. In our growing community, it is not wise to reduce the amount of potable water for our citizens. Additionally, the environmental impacts to dewatering the aquifer will have countless negative consequences including: loss of vegetation, loss/reduction of wetlands, natural fire protection, lowing the water level of Old Fort Lake, and drying out the Sequalichew Creek area.

1 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

I am concerned about the impact to our wetlands, creek, seeps, and springs. These water sources are incredibly important to the vegetation and wildlife here. The proposed dewatering will have lasting negative consequences to our environment.

2 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

I am concerned the dewatering of the Vashon Aquifer will negatively impact the plants that rely on the seeps and springs near Sequalichew Creek. Wildlife rely on the water as well as the plants. They will no doubt be negatively impacted. The downstream effects of dewatering the aquifer will be felt throughout our ecosystem.

3 DS EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

I am concerned about the impact to the Sequalichew Creek Trail area. Our trail system, especially Sequalichew Creek Trail, attracts visitors from all over our region. With less water feeding Sequalichew Creek, the once peaceful lush environment of the trail will be forever changed.

4 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

Please do not approve a mining permit that will destroy our stream, hillside, and wetlands. No mitigations exist, nor is any mitigation proposed, that would protect our environment.

5
EA

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Dear Director Kincaid,

I am extremely concerned about the proposed CalPortland South Parcel mine expansion and its impact on the groundwater level due to dewatering the Vashon Aquifer. This could significantly affect surrounding vegetation and increase fire danger for our residents, homes, and businesses. It would dry up the seeps along the Sequalitchew Creek Trail, causing the hillside slopes to dry up. I walk this trail with my dogs every week. I love to hear the babbling of the Sequalitchew Creek alongside the trail. If the South Parcel mine expansion receives a permit the creek water alongside the trail would go dry for almost half of the year. Currently, the underground water from the Vashon Aquifer feeds the lush hillside as well as the creek and our wetlands. Please DO NOT approve a mining permit that will destroy our stream, our hillside, and our wetlands IN PERPETUITY. No mitigations exist, nor is any mitigation proposed, that would protect our environment.

The projected drop in the groundwater level of up to 9 feet in Edmonds Marsh is of specific concern. Other areas of concern include the drop in groundwater level in Pond Lake, wetlands 8, 9, and 10, and Old Fort Lake. Additionally, the elimination of the Kettle Wetland and the drying up of seeps and springs feeding Sequalitchew Creek are troubling. This drop in groundwater level will likely dry out the vegetation surrounding the City of DuPont. Climate conditions have worsened since the 2011 Settlement Agreement was prepared. The City of DuPont is surrounded by forests, and climate change is already increasing the risk of fire to our residents. The resulting decrease in the groundwater level from the mine expansion will likely put DuPont residents at an even greater risk of fire danger.

Restoring Sequalitchew Creek does not have to depend on dewatering the Vashon Aquifer. It should be restored without dewatering the Vashon Aquifer. In fact, CalPortland could be a great community partner by funding the restoration WITHOUT dewatering the aquifer. As outlined above, the decrease in groundwater level throughout the area will likely have a significant negative environmental impact on our wetlands, vegetation, and wildlife.

Thank you!
Concerned Citizen

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

The mining and crushing of gravel creates and releases fine particulate matter called Crystalline Silica into the air which will be carried by the wind towards homes and schools. These dangerous particles will permeate homes, and neighborhoods.

1 EA Cal

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Dewatering (when groundwater inflows are pumped out to maintain access to mines) can cause a decrease in the surrounding water tables. This decrease, a long with an issue with PFAS

2 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

DuPont enjoys a very biodiverse environment that is essential in maintaining positive levels of fish/plants/animal populations. Allowing this expansion of mining into the undisturbed area, even if in a limited manner, would greatly impact those levels for generations to come.

3 EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

I understand the need to grow and expand the city of DuPont but I urge the city to balance that need for growth and expansion with considerations being made for our future and quality of life it provides to the uniqueness that is DuPont.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

The Vashon Aquifer helps maintain the intrinsic natural beauty of the Sequalitchew Creek Trail.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If the water that flows around and down through the trail is stopped the vegetation currently there will not thrive. I and my family walk/run the trail weekly and during the summer it's cool and beautiful! If the water that currently feeds much of the side vegetation is eliminated I'm certain that the beauty of this amazingly beautiful trail will be significantly impacted. And the quality of the natural setting will suffer.

2 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Surface water is a key component to the current ecosystem along the Sequalitchew Trail. Decreasing that or eliminating that water source will significantly detract from its current state of beauty

3 DS EA

Clover Creek Restoration Alliance

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
Sequalitchew Creek is groundwater-fed. By dewatering the nearby aquifer, CalPortland puts a nail in the coffin of the Creek.
While the hope is that Sequalitchew lake surface water will one day by directed back into the creek, the cooler groundwater is very much needed to keep temperatures viable for salmon.

1
DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
This move to destroy Sequalitchew Creek is in violation of the Endangered Species Act. Salmon are a protected species, and efforts must be made to restore the habitat here.

If you have concerns regarding the EARTH, please describe them below.
This will destroy the natural habitat. It is not a needed thing to do. We need to start figuring g out how to help Mother Earth, not continue to destroy her. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.
Air quality can be poor at times, with all the extra machinery this will not help breathing.
Who will be held accountable for asthma or cancer issues in the years to come? 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
How is this going to affect the water quality? For the humans and the wildlife?! Who is responsible for issues that arise from the water supply? 3 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
We do. Not need to continue to contaminate the water supply, we have already seen what it does. We need to start looking ahead. 4 DS

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
How will the vegetation change, will it survive? We know it will change and it won't be for the better. 5 EA

If you have concerns regarding NOISE, please describe them below.
Are we thinking about the increase noise levels. What about the people who have noise sensitivity? They already struggle to be in public, but now they are not safe in their own homes. 6 EA

If you have concerns regarding LAND USE, please describe them below.
This is not the place to destroy thousands of people use this area to reconnect with mother nature. 7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.
How does this affect people's property value. Who covers the cost if they lose value?

If you have concerns regarding the EARTH, please describe them below.

"Reclamation" of mined lands results in habitat that is considerably inferior to the original land, in terms of soil quality, moisture regime, hydrological relationships to the groundwater and to associated wetlands and springs, and potential forest or prairie recovery. You can NEVER restore land to as good a quality as it is before mining, and you cannot reverse ongoing destruction of habitat availability and habitat quality through "restoration." 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

The most crucial requirement for fish habitat is water. By dewatering the nearby aquifer, which is hydrologically connected to Sequalichew Creek and to wetlands in the surrounding area, this project will greatly harm fish habitat. It will reduce or eliminate flow in parts of the creek. Reduced flows degrade water quality during crucial times of the year. 2 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Dewatering the aquifer to allow deeper mining will reduce the presence and quantity of surface water in Sequalichew Creek and in area wetlands. This is a net loss of habitat and habitat quality to these areas and to the adjacent portions of Puget Sound which cannot be mitigated. 3 DS

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

This action is incompatible with Puget Sound salmon recovery, as it will degrade a perennial stream entering Puget Sound. Streams such as Sequalichew Creek are refugia during late times of high temperature and low flow, since they are fed by seepage from deep, cool aquifers (see reference, Tague and Grant, 2004).The moist forest surrounding Sequalichew Creek will also be affected, and will be less resilient to drought, less able to shade the creek, and less able to support moisture-reliant plants. 4 EA Cal

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

Sequalichew Creek is a major visitor attraction in DuPont. Do not let the experience be degraded by loss of forest, drying up of the creek, and noisy mining activity.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

Received 26 August 2003; revised 14 January 2004; accepted 9 February 2004; published 28 April 2004.

[1] In ungauged basins, predicting streamflows is a major challenge for hydrologists and water managers, with approaches needed to systematically generalize hydrometric properties from limited stream gauge data. Here we illustrate how a geologic/geomorphic framework can provide a basis for describing summer base flow and recession behavior at multiple scales for tributaries of the Willamette River in Oregon. We classified the basin into High Cascade and Western Cascade provinces based on the age of the underlying volcanic bedrock. Using long-term U.S. Geological Survey stream gauge records, we show that summer streamflow volumes, recession characteristics, and timing of response to winter recharge are all linearly related to the percent of High Cascade geology in the contributing area. This analysis illustrates how geology exerts a dominant control on flow regimes in this region and suggests that a geological framework provides a useful basis for interpreting and extrapolating hydrologic behavior. *INDEX TERMS:* 1860 Hydrology: Runoff and streamflow; 1824 Hydrology: Geomorphology (1625); 1884 Hydrology: Water supply; *KEYWORDS:* geologic framework, low flow, Oregon Cascades, recession analysis

1. Introduction

[2] Predicting streamflows in ungauged catchments is emerging as a major scientific and societal challenge, prompting the International Association of Hydrological Sciences (IAHS) to declare the years 2003–2012 as the IAHS Decade on Predictions in Ungauged Basins (PUB). Providing information on distributed streamflow is often limited by the availability and spatial distribution of long term streamflow records. Within the United States, stream gauge networks are often sparse in large tracts of undeveloped land and wilderness areas. The western slopes of the Cascade Mountains in Oregon are such a region. Here the sharply seasonal Mediterranean climate results in high winter precipitation and an extended summer drought, and translates into a streamflow pattern of high winter peaks and very low summer flows. There is, however, considerable spatial variability in the degree to which streamflow reflects the seasonal precipitation pattern, with some streams having muted winter peaks and sustained high summer base flows [*Grant*, 1997]. Climate alone cannot explain this behavior. Moreover, the existing streamflow network does not adequately capture this variability, in large part because the importance of the spatial structure of streamflow production in this region has not been recognized until now.

[3] In this paper, we characterize flow regimes of western Oregon based on a geological framework. Conceptually, our approach follows *Winter* [2001], who advocates hydrologic comparison based on geologic-geomorphic landscape attributes. We examine streamflow regimes in the westward draining tributaries of the Willamette River system and systematically relate spatial differences in streamflow to differences in geology and geomorphology within the region. In particular we characterize flow regimes with respect to a broad geologic partitioning of the Cascade Mountains into the older, deeply dissected Western Cascades and the younger, relatively undissected High Cascades [*Sherrod and Smith*, 2000; *Walker and MacLeod*, 1991]. The lateral contiguity of two lithologically similar but geomorphically and age-distinct geological terranes provides a unique opportunity to examine geological control of hydrologic regimes at the landscape scale.

[4] Using data compiled from long-term streamflow records for both High Cascade and Western Cascade streams, we examine a population of streamflow volumes, hydrograph recession curves, and other time series measures. We also examine the extent to which flow regimes of the larger tributaries of the Willamette and main stem Willamette reflect this underlying geological framework. We focus on summer base flow responses because these flows most dramatically highlight differences between the two geologic provinces, and have significant ramifications for water resource management and the ecology of the region.

2. Background

2.1. Regional Setting

[5] The western slopes of Oregon's Cascade Mountains are drained by large westward flowing rivers that are

Copyright 2004 by the American Geophysical Union.
0043-1397/04/2003WR002629$09.00

tributaries to the northward flowing Willamette River. Within the Cascades, these large rivers generally flow perpendicular to the strike of two distinct geologic provinces: the Western and High Cascades (Figure 1). In both provinces 80% of the precipitation falls during the winter months. Most of this precipitation falls as snow above 1500 m and as rain below 400 m, with a mix of rain and snow at intermediate elevations. By virtue of their higher elevations, the High Cascades are more snow-dominated than the Western Cascades, although the highest elevations of the Western Cascades typically retain snowpacks until late into the spring, similar to the High Cascades. Winter storms for both regions result from broad frontal systems; convective systems and thunderstorms are generally limited to summer months and though locally intense represent a very small fraction of the annual water budget.

[6] The Western Cascades are dominated by deeply weathered, layered, basaltic and andesite lavas and volcaniclastic flows of mostly Miocene age. The steep, highly dissected landscape of the Western Cascades ranges in elevation from 400 to 1800 m and reflects significant erosion by fluvial, glacial, and mass movement processes. The region is typically well-drained, with soils 1–3 m in depth of moderate to high surface hydraulic conductivities grading vertically to shallow subsurface confining layers of clay, saprolite and unweathered bedrock of generally low permeability. Drainage densities are high, averaging 3 km/km^2, further reflecting an efficient well-organized drainage system [*Wemple et al.*, 1996].

[7] The High Cascades form a broad volcanic platform, fault-bounded in places to the west and east, and represent a much younger geological terrane. Higher in elevation but lower in relief than the Western Cascades, the High Cascades primarily reflect recent constructional volcanism rather than erosional forms. Rock type is dominated by low gradient basaltic and andesitic lava flows, cinders, pumice, and volcanic ash, mostly from shield volcanoes, cones, and vents of Plio-Pleistocene age or younger. Blocky aa-type basalt flows are often visible at the surface in areas of the High Cascades. The young age of the surficial deposits results in poor soil development. Surface and subsurface hydraulic conductivities in young volcanic deposits are exceptionally high due to highly porous and permeable volcanic layers. Many areas of the High Cascades appear to lack surface drainage systems, and drainage density in the High Cascade province is significantly lower than in the Western Cascade province, averaging 1–2 km/km^2 [*Grant*, 1997]. Several High Cascade streams are headed by large, voluminous springs, indicating the existence of extensive, well-developed subsurface drainage systems.

2.2. Previous Research on Cascade Mountain Hydrology

[8] The earliest work on the hydrology of the Cascades is probably that of *Stearns* [1929], who documented the importance of spring flow from deep volcanic aquifers as contributing to the base flow of the McKenzie River. Most of the hydrologic research since then, including virtually all studies of the impacts of forest management on streamflow, has focused on Western Cascade systems and has demonstrated the importance of shallow, rapid subsurface flow as a factor contributing to high peak flows and flow variability [*Rothacher*, 1965, 1970, 1973; *Harr*, 1976a, 1976b, 1986; *Harr et al.*, 1975, 1982; *Jones and Grant*, 1996].

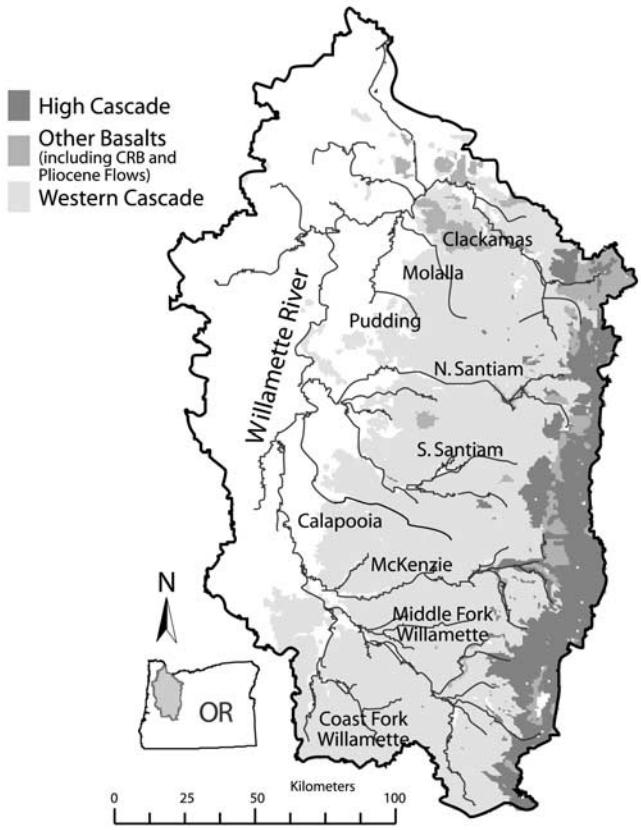

Figure 1. Willamette River Basin, Oregon, showing approximate location of High and Western Cascade geologic divide. Gray scale represents percent High Cascade geology in contributing area of east-west trending subbasins.

[9] High Cascade streams, in contrast, have received much less attention. Virtually all hydrologic research has focused on characterizing High Cascade snowmelt and spring-dominated streams on the eastern slopes of the range [*Manga*, 1996, 1997, 1999; *Gannett et al.*, 2003]. Although they share a broadly similar geology, there are important differences between the eastern and western slopes of the Cascades particularly with respect to the amount of annual precipitation (westside ~2000 to 3800 mm; eastside ~750–1650 mm [*Taylor and Hannan*, 1999]).

3. Methods

3.1. Geological Classification

[10] For the purposes of this study we classified rock units as High Cascade or Western Cascade based on rock type and age, using a 1:500,000 scale geologic map of Oregon [*Walker and MacLeod*, 1991] (Figure 1). Volcanic rocks greater than 8 Myr old were classified as Western Cascade, volcanic rocks younger than 2 Myr old were classified as High Cascade, and rocks between 2 and 8 Myr old were classified in one or the other category based on topographic position (i.e., ridge-capping basalts) or geography (i.e., proximity to High Cascade vents or

volcanic centers, location with respect to north-south bounding faults).

3.2. Correspondence Between Geology and Streamflow Volumes

[11] Streamflow records for 22 headwater (third to fifth order) streams from the Western Cascade and High Cascade provinces in the Willamette drainage basin were obtained from the USGS gauge network (Table 1). Historically the USGS has maintained a much denser network of gauges in the Western as opposed to High Cascade region, primarily to predict flood discharges and inflows to reservoirs. All available USGS streamflow sites that contain significant High Cascade contributing area were included in this study, while Western Cascade sites spanning a range of drainage areas were randomly selected to represent this geologic province. With the exception of Oak Grove Fork (site 14208500), no dams or diversions are located above these sites. On Oak Grove Fork, the small storage facility at Timothy Lake is primarily operated as run-of-river and does not significantly affect streamflows. To explore higher-order stream response that integrates both High Cascade and Western Cascade contributing areas, we also included records from 6 USGS gauges located along the main stem of the McKenzie. For each of the available gauges standard long-term low flow statistics, including mean August and mean annual flow, were computed and compared with the proportion of High Cascade geology in the contributing area. These measures were used to describe differences in the magnitude of total and summer flow within the region.

3.3. Recession Analysis

[12] *Brutsaert and Niebert* [1977] developed a method for estimating soil and geomorphic parameters from low flow analysis based on analytical solutions to the Boussinesq equation. The Boussinesq equation describes flow, Q, from an unconfined, horizontal aquifer; Brutsaert and Niebert related parameters a and b in the recession equation (1) to geomorphic and soil characteristics of the aquifer:

$$\frac{dQ}{dt} = -aQ^b \tag{1}$$

Formal recession analysis [*Brutsaert and Niebert*, 1977; *Brutsaert and Lopez*, 1998] requires both that the watershed be reasonably conceptualized as a single unconfined aquifer; and the characteristic response time of the aquifer be less than the period over which significant recharge does not occur. However, *Manga* [1999] found that for an eastside Cascade spring system, aquifer response time was longer than the period without significant recharge. In spite of negligible High Cascade summer precipitation, the period without significant recharge is shorter than might be expected because significant snowmelt recharge typically continues into the summer months. Further, exploratory analysis of recession behavior, as discussed below, suggests

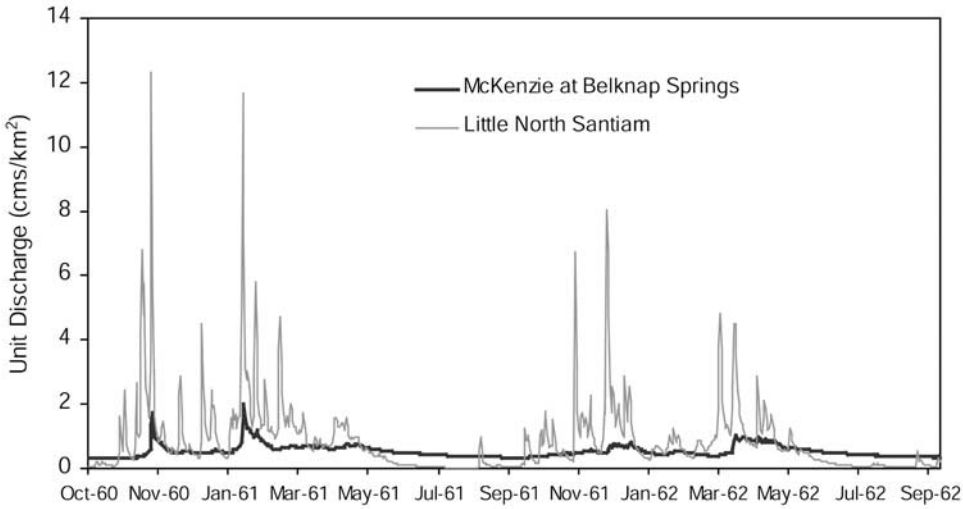

Figure 2. Daily streamflow hydrographs, normalized by drainage area, for a predominantly High Cascade (McKenzie at Belknap) and Western Cascade (Little North Santiam) rivers.

that High Cascades catchments may be better conceptualized as a system of two aquifers (surface and deeper groundwater) rather than as a single aquifer.

[13] Although prerequisite conditions for formal recession analysis were not met in this case, exploratory analysis of the relationship between log(dQ) and log(Q) provides insight into system behavior and may indicate fundamental differences in controlling processes. In particular, changes in the log(dQ) versus log(Q) relationship over the distribution of flows may indicate differences in dominant streamflow generation processes – both between different catchments and for different streamflow periods in the same catchment.

[14] If long term (multiple year) historical streamflow records are used to compute a mean slope of the log(dQ)/log(Q) relationship, this slope reflects the interaction among the time-distribution of recharge, the characteristic response time of the system, and aquifer hydraulic characteristics. Since seasonal patterns of precipitation are relatively similar across the High/Western Cascade region cross-basin differences in average recession behavior (i.e., slope of the logdQ/Q relationship) represent the combined effects of differences in snowmelt-driven recharge and watershed drainage properties. The maximum recession rate for a given streamflow, as described by the upper envelope of the log(dQ)/logQ relationship, should indicate the response of the system with the least impact from previous recharge events. These values should approach the catchment response where time without significant recharge is longer than the characteristic response time of the system. The slope of this envelope curve should therefore approach the recession behavior due primarily to underlying aquifer characteristics.

[15] Hydrograph recessions for each site were extracted from historical streamflow records, with a recession period defined as any period following a recharge event (defined as a decrease in daily 3-day averaged streamflow). Log(dQ/dt) versus log(Q) relationships for all recession periods were plotted and fit to a linear least squares regression model for each site. A first-order difference was used to approximate dQ. The resulting slope and intercept (b and a, respectively, in equation (1)) for all sites was then plotted against proportion of High Cascade geology to examine the extent to which geology defines mean basin recession characteristics.

3.4. Cross-Correlation Analysis

[16] We evaluated the difference in timing of response to winter recharge events between the Western and High Cascades. Visual analysis of High Cascade stream hydrographs suggested a delayed and muted response to winter recharge events relative to Western Cascade systems (Figure 2). Quantification of this delay thus provides another metric to assess how differences in snowmelt and geology define hydrologic response between the two systems. *Manga* [1999], following *Padilla and Pulido-Bosch* [1995], used cross-correlation between spring discharge and discharge from a neighboring surface water-dominated stream to estimate the time lag associated with the spring system. In Manga's study, discharge from the surface water-dominated system was used as a proxy for recharge. Although we did not have neighboring streams with contrasting subsurface and surface hydrology, in this study we estimated the average delay associated with High Cascade systems relative to Western Cascade systems using a similar approach.

[17] Five pairs of low-order High Cascade and Western Cascade streams were selected based on (1) high proportion of either High or Western Cascade geology in contributing area, (2) availability of overlapping time periods for streamflow records, and (3) spatial proximity. Cross correlation between the High Cascade and Western Cascade streams, and autocorrelation for the Western Cascades stream, were computed for each pair using methods described by *Box and Jenkins* [1976]. The average lag between the Western and High Cascade streams was estimated as the shift (in days) of the center of mass of the cross correlation function relative to the autocorrelation function. The center of mass was computed over the range of lags with a positive temporal correlation.

[18] To examine time lag response in higher-order streams incorporating both High Cascade and Western

Cascade influences in their drainage area, this analysis was repeated for the 6 sites along the main stem McKenzie. In this case, an arbitrary Western Cascade stream (Lookout Creek) was selected as the reference stream, and relative delays were determined for each of the 6 sites. The relationship between this delay and percent High Cascade contributing area was then determined.

4. Results

[19] Unit area hydrographs for High Cascade and Western Cascade streams with similar drainage areas reveal the contrasting hydrologic regimes of the two regions (Figure 2). The High Cascade hydrograph (McKenzie River at Belknap) depicts much more uniform flows with muted winter peaks, slower rates of recession, and higher summer base flows that remain nearly constant throughout the summer dry season. Winter flows are only 3–4 times higher than summer flows. In contrast, the Western Cascade stream (Little North Santiam at Mehama) exhibits a much flashier and more variable hydrograph, with winter peak flows that are several orders of magnitude greater than summer base flows.

4.1. Correspondence Between Geology and Streamflow Volumes

[20] Historical averages of low flow volumes show a strong relationship with geology for both low- and higher-order streams. Low-order streams that are predominately sourced in the High Cascades maintain 4–5 times the summer streamflow volumes (per unit drainage area) relative to those primarily sourced in the Western Cascades (Table 1 and Figure 3). Further, when streams draining areas with both High Cascade and Western Cascade rocks are examined, the log-transformed mean August streamflow, normalized by drainage area, shows a near-linear relationship ($R^2 = 0.76$; least squares linear regression is significant at 1% level) with the proportion of High Cascade geology in the contributing area (Figure 3). Mean annual flow, on the other hand, shows no significant relationship with geology which is not surprising given similarities in total annual precipitation over the two regions.

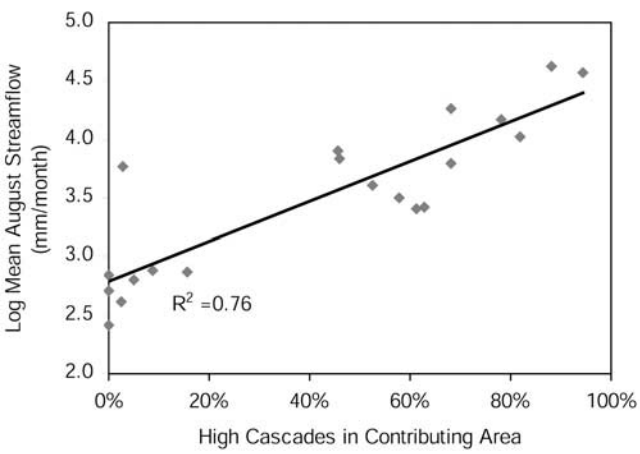

Figure 3. Relationship between mean August streamflow and percent High Cascade geology in contributing area for low-order streams.

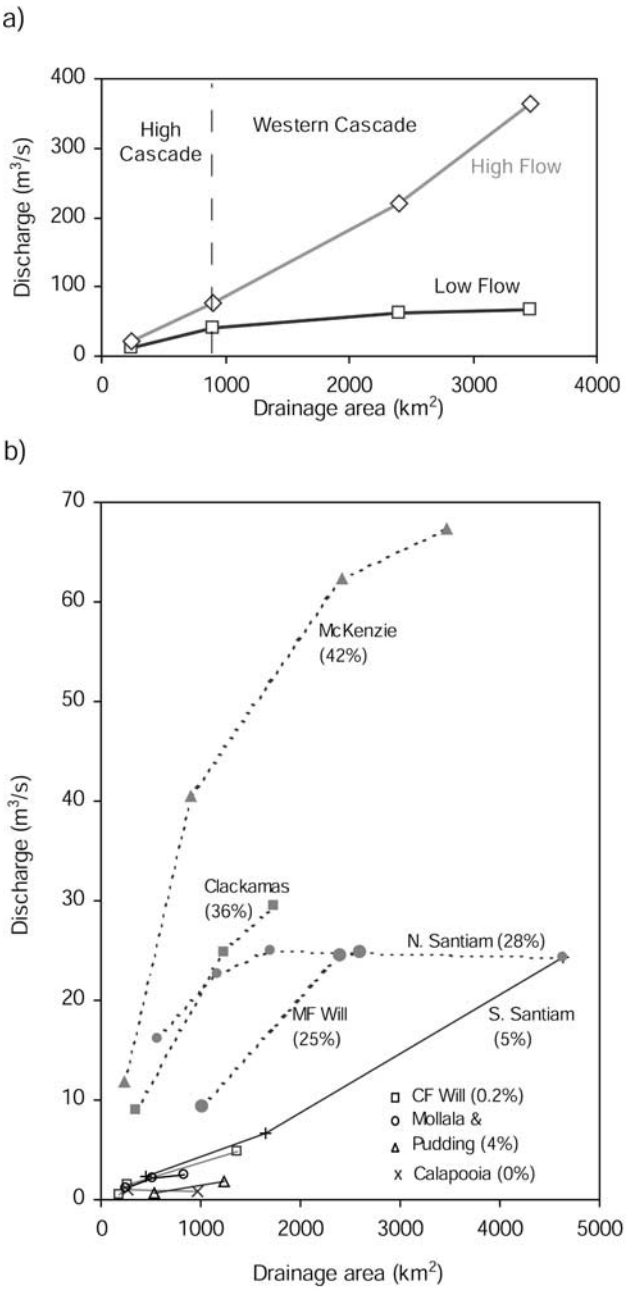

Figure 4. Discharge-drainage area relations showing impact of High Cascade contributions for (a) gauges along the McKenzie River at high (1 March 1950) and low (1 September 1950) flow and (b) east-west trending subbasins of the Willamette at low flow (1 September 1950). Percentages of High Cascade basin area shown in parentheses.

[21] Larger streams such as the McKenzie amass an increasing proportion of Western Cascade geology with longitudinal distance downstream, resulting in a nonlinear discharge-drainage area relationship (Figure 4a). During the summer, most of the water in the McKenzie is sourced from the High Cascades, producing a convex upward trend. During the winter wet season, on the other hand, most streamflow is derived from the surface and shallow subsurface runoff system in the Western Cascades, producing a

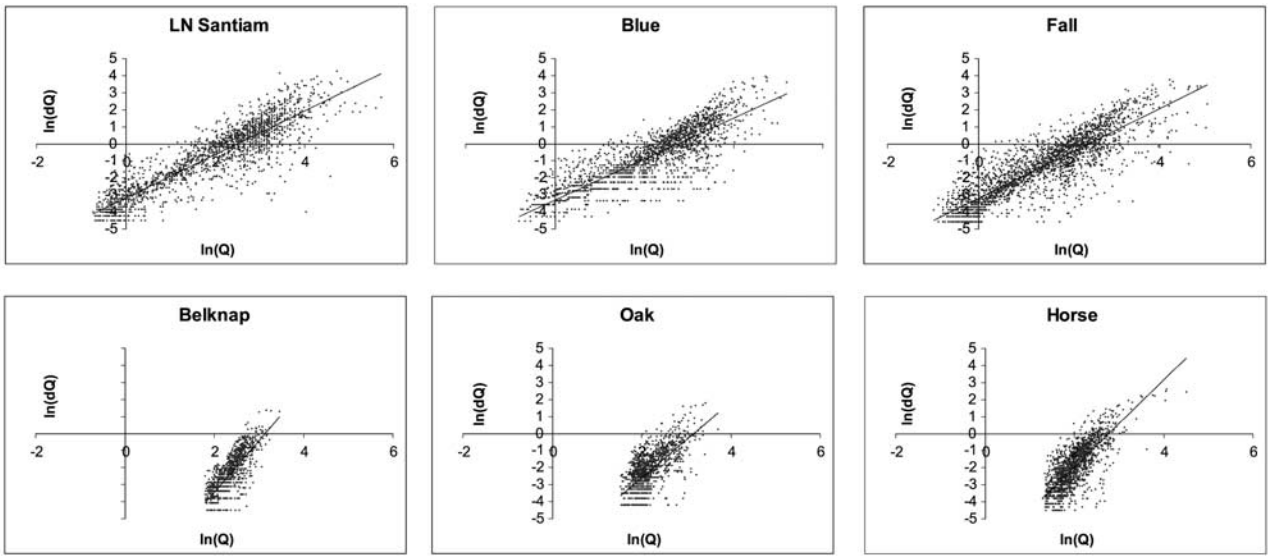

Figure 5. Log(dQ) versus Log(Q) relationships for three predominantly Western Cascade (LN Santiam, Blue, and Fall) and three predominately High Cascade (Belknap, Oak, and Horse) streams.

concave upward relationship between drainage area and discharge. The shape of the discharge versus drainage area curve is quite diagnostic for the proportion of basin area classified as High Cascade for other westward flowing Willamette basins as well (Figure 4b). Basins with a high proportion of High Cascade geology show a characteristic convex upward trend (i.e., McKenzie), with the inflection denoting the boundary between the High and Western Cascade provinces. Basins sourced entirely within the Western Cascades (i.e., S. Santiam), on the other hand, display a linear increase of discharge with drainage area.

4.2. Recession Analysis

[22] The two provinces also differ in characteristic recession behavior, as revealed by the relationship between log(dQ) and log(Q) and the associated linear regression models across the continuum of High and Western Cascade streams. Both stream types maintain a reasonably log-log linear relationship between flow and recession rate, although High Cascade streams appear to have a curvilinear upper envelope, suggesting that the rate of change of flow decreases at higher flows (Figure 5).

[23] These recession characteristics suggest that High Cascade streams more closely resemble the flow behavior of Western Cascade streams at particularly high flows, as indicated by the reduced slope of the log (dQ) versus log (Q) relationship. This pattern of response is consistent with an interpretation of the High Cascade system as comprised of a deep aquifer that dominates the low flow end of the curve, with some shallower subsurface flow paths that become active at higher flows, while Western Cascade response almost entirely reflects the dominance of shallow subsurface flow paths. Intercepts also differ between Western and High Cascade streams with higher intercepts (less negative) associated with the Western Cascades. A higher intercept in the log(dQ) versus log(Q) relationship indicates more rapid recession and thus a more efficient drainage system. Steeper hillslopes and higher drainage densities contribute to this efficiency. In contrast, the many spring-fed High Cascade streams tend to have very flat recessions at the low flow end, hence lower intercepts.

[24] *Brutsaert and Niebert* [1977] argue that the Boussineseq equation will produce a slope of 3 in the log(dQ)/log(Q) relationship for short-time solutions, and 1.5 for longer time solutions. Thus the log(dQ)/log(Q) behavior of

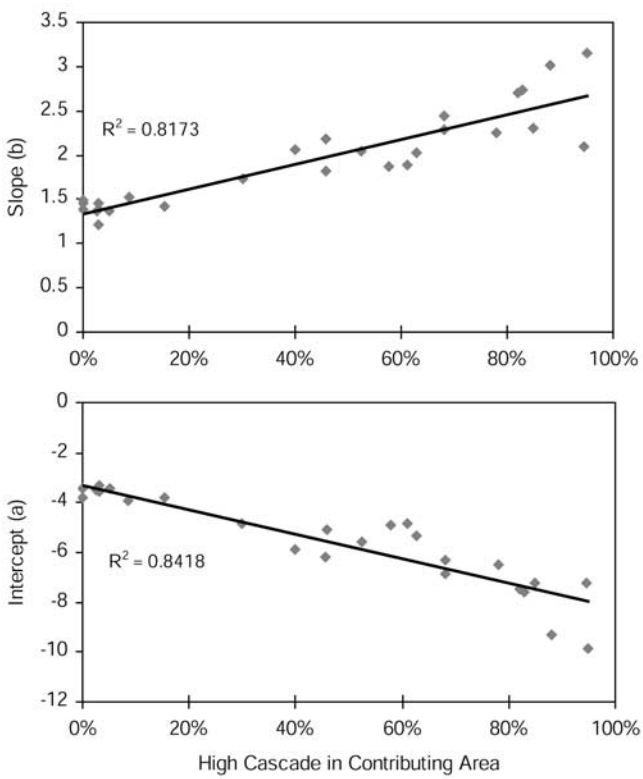

Figure 6. Average slope b and intercept a of log(dQ)/log(Q) relationship with percent High Cascade contributing area.

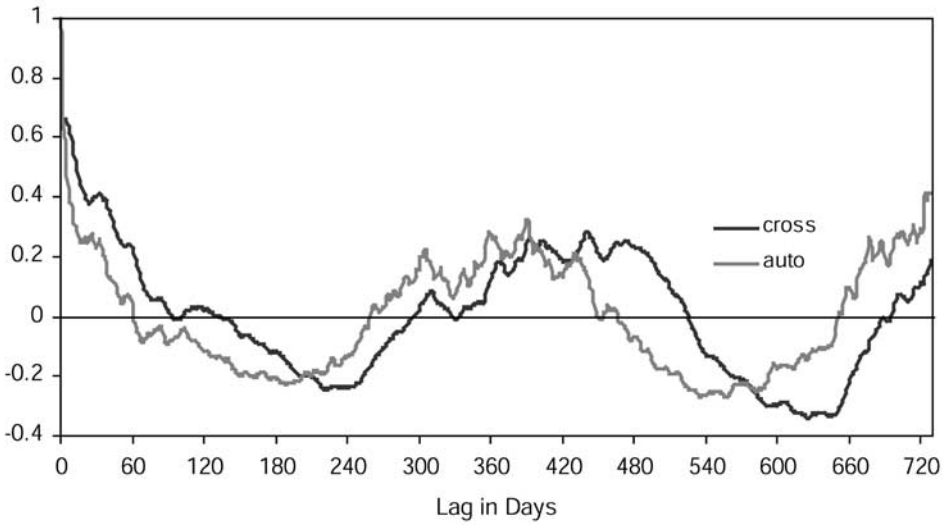

Figure 7. Cross-correlation functions for McKenzie at Clear Lake (High Cascade) against Blue River (Western Cascade); showing shift in days relative to autocorrelation function for Blue River.

systems that respond more quickly (i.e., steep, shallow subsurface aquifers) will generally reflect a slope of 1.5 corresponding to the longer time solution. Mean slope values for High Cascade dominated streams range between 2–3, while slopes for Western Cascade streams are closer to 1.5. High Cascade systems therefore suggest response characteristics of an aquifer that remains close to fully saturated while the mean slope of the Western Cascade streams reflect conditions that are less than fully saturated. At very high flows, slopes of the High Cascade relationship tend to reduce; suggesting the transition to a different (shallow subsurface) flow system with much shorter timescales.

[25] We emphasize that in addition to geologic controls on rock permeability and aquifer characteristics, recession behavior of High Cascade system may result from the greater prevalence of seasonal snowmelt as opposed to rain and rain-on-snow as the primary sources of recharge in the often lower elevation Western Cascades. However, parameters estimated for relatively high elevation Western Cascade streams, such as East Humbug, still fall within the range expected for Western Cascade streams (Table 1). This suggests that geology is the dominant factor controlling Western and High Cascade streamflow distinctions.

[26] Further evidence of the extent of geological control is implied by the mean responses of the log(dQ)/log(Q) relationship across a population of streams with varying proportions of High/Western geology and elevations (Figure 6). The strong linear relationship between recession characteristics (slope and intercept) and percent High Cascade geology, regardless of elevation, suggests that properties related to the geology exert first-order controls on recession behavior.

4.3. Cross-Correlation Analysis

[27] Consistent with the slower rates of recession associated with High Cascade systems, the timing of response to winter recharge is delayed for High Cascade systems. This delay is evident in the comparison between the cross-correlation function (between High and Western Cascade streams) and the autocorrelation function associated with the Western Cascade streams. Figure 7 provides an illustrative example; other pairs behave similarly.

[28] When delay is quantified as the difference in center of mass between the cross and autocorrelation function, the response of High Cascade streams is delayed, on average, 30 days relative to Western Cascade streams (Table 2). These values are significantly shorter than the 47–137 day time delay estimated by *Manga* [1999] in a similar analysis that compared runoff and spring-dominated streams on the eastern side of the Cascades. The difference may lie in the steeper topography, hence assumed hydraulic gradients, on the westside of the Cascade crest, resulting in more rapid response. At larger scales, for a series of streams along the McKenzie, relative to a reference Western Cascade stream (Lookout Creek), delay increases linearly as proportion of High Cascades increases (Figure 8).

5. Discussion

[29] Using a geologic framework as a basis for hydrograph analysis provides a broad scale characterization of flow regimes at multiple scales along the western side of the Oregon Cascades. By classifying the region into High Cascade and Western Cascade geologic provinces, two end-member hydrologic behaviors emerge that differ in terms of magnitudes of summer low flows, recession dynamics and the timing of seasonal response to winter recharge. High Cascade end-members show total annual

Table 2. High Versus Western Lag Time

Western	High	Lag, days
East Humbug	Breitenbush	6
L. N. Santiam	N. Santiam	25
Lookout	SF McKenzie	14
Molalla	Clackamas	34
Fall Creek	Salmon Creek	22

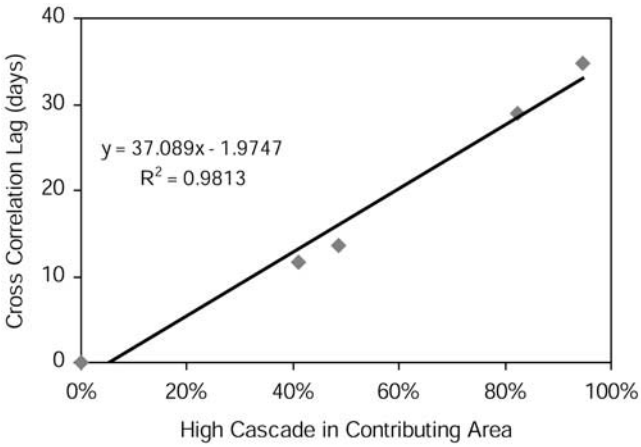

Figure 8. Estimation of lag (difference between auto and cross correlation function) between Lookout Creek (Western Cascade) and streams along the McKenzie with varying proportions of High Cascade contributing area.

flows comparable to Western Cascade end-members but 4 to 5 times higher summer low flows, when normalized by drainage area. High Cascade end-members also show slower recession rates and evidence of two-phase recession behavior that includes a relatively fast response to winter storm events, but is dominated by slower and deeper groundwater flow. Finally, High Cascade streams reflect a 30–40 day delay in the timing of response to winter recharge.

[30] In streams that include both geologic types in their contributing area, there is a surprisingly consistent and predictable relationship between the relative proportion of High Cascade and Western Cascade geologies and key aspects of hydrologic response. Total summer monthly streamflow volumes, slope and intercept of master recession curves, and relative delay of response to winter recharge are all linearly related to the percent of High Cascade geology in the contributing area. These results give us some confidence that useful quantitative estimates of low flow hydrographs can be extrapolated from gauged to ungauged catchments in this area, using a geologic framework as the basis for extrapolation. One caveat is that these values represent historical long term averages, and there may be variation in these relationships under different climatic conditions, i.e., between wet and dry years.

[31] The above analysis suggests two distinctive hydrologic mechanisms that control base flow response in this region. The geologic partitioning into High Cascade and Western Cascade to some extent combines the effects of elevation-driven differences in rain- versus snow-dominated precipitation, and geologic controls on drainage efficiency. The linear response of both timing and magnitude of flow regime to percent High versus Western Cascade geology, regardless of mean basin elevation, suggests that geology has a strong direct (i.e., via flow path, hydraulic gradient and conductivity) control on the response. The observed streamflow behavior is consistent with an interpretation of the Western Cascades as dominated by a well-developed flow network of shallow subsurface flow paths, along steep gradients with high lateral conductivities. High Cascade behavior is consistent with a deeper groundwater system with some rapidly drained shallow subsurface flow paths accessed during high flow periods. Field surveys showing the importance of large springs as primary sources for many High Cascade streams support this interpretation [*Stearns*, 1929; *Ingebritsen et al.*, 1992; *Manga*, 1996, 1997, 1999; *Grant and Tague*, 2002]. Further research using isotopic tracers and other techniques is needed to better resolve these flow path distinctions as well as the relative importance of snowmelt as a key control.

6. Conclusion

[32] Geology and geomorphology are often the dominant controls on flow regimes through their direct effect on hydrologic pathways, storage properties, and relief, and indirectly through their effect on meteorologic forcing. Analysis of summer streamflow regimes in the Oregon Cascades suggests a geological framework provides a useful basis for interpreting and extrapolating hydrologic regimes in this region. Although the mountainous volcanic landscapes of the western slopes of the Cascades have many distinctive attributes that lend themselves well to this kind of analysis, we maintain that the degree to which geology affects streamflow in this region is not unique. This paper provides an illustrative example that suggests that progress toward resolving the problem of predicting streamflows in ungauged basins can be made by explicitly structuring the analysis of streamflow using geo-hydrologic landscape types: broad regional areas defined by similarity in the physical and hydraulic properties of underlying rocks, history of landscape evolution, and key processes mediating flow. Results from this example suggest that a major task within the Predictions in Ungauged Basins initiative may be to identify these geo-hydrologic landscape types and develop a multiprong analysis to evaluate their relationships with flow regimes.

If you have concerns regarding the EARTH, please describe them below.

We must be the best stewards of the land entrusted in our care, for the good of our community, for the good of the environment, for future generations wishing to drink clean water and breath clean air.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Allowing CalPortland to drain our aquifer to mine under the water table is short-sighted and foolish.

We underestimate the importance of clean water.

In the future, clean, drinkable water will become an increasingly scarce and precious resource. Our water is already contaminated by PFAS "forever chemicals" from JBLM. Withdrawing vast amounts of ground water will pull more pollutants towards our drinking water sources. There are huge toxic plumes from JBLM that threaten our water supply.

In some areas lack of potable water already is at a critical level. With climate change, it will become worse. Thurston County limits development due to a lack of water.

The lack of water is already a harsh reality in much of Washington. The Washington State Department of Ecology declared a drought emergency April 16, 2024, which is really a continuation of 2023's drought emergency. The department makes such a declaration when the state's water supply is less than 75% of normal. Water systems in Clallam County and Whatcom County are now trucking in water to meet demand. Ecology anticipates that water may need to be trucked into the Olympic Peninsula this summer. Washington has declared drought in six of the last 10 years.

2 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

We underestimate the importance of our trees and our prairie. How can we allow this rare oak prairie habitat to be destroyed?

Our prairies support a variety of plants and animals – some of which are listed as threatened or endangered under the federal Endangered Species Act. This rare ecosystem is home to many of Washington's most endangered species, and should honestly be one of DuPont's highest conservation priorities.

Prairies are one of the rarest ecosystems in Washington State. Once common in the South Puget Sound, prairie and oak woodlands habitats are now almost completely wiped out, with just 3% of original prairies remaining. Created by glaciers 15,000 years ago which left behind gravelly soils, the same gravel that Cal Portland wants to extract for their own profit to the detriment of our community and the endangered flora and fauna that currently survive there.

3 EA

The loss of trees and habitat could negatively affect the Puget Sound. Katsuhiko Matsunaga, a marine chemist at Hokkaido University in Japan, found that when tree leaves decompose, they leach acids into the ocean that help fertilize plankton. When plankton flourish, so does the rest of the marine food chain. In a campaign called Forests Are Lovers of the Sea, fishermen have replanted forests along coasts and rivers to help bring back fish and oyster stocks. And it worked, they have returned.

Trees act as nature's water filters, capable of cleaning up toxic waste, mainly through communities of microbes around tree roots that clean water in exchange for nutrients, a process known as phytoremediation. Tree leaves and needles also filter air pollution and clean the air and provide oxygen. Trees help to cool our environment and mitigate the effects of a warming planet.

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

We must strategically conserve our local natural resources to benefit residents and the well being of our future.

4 EA

This plan to dewater our aquifer is wrong and the opposite of what we should be doing in DuPont to ensure a healthy DuPont for all, not just short-term corporate profits.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Dear Director Kincaid,

I am extremely concerned about the proposed CalPortland South Parcel mine expansion and its impact on the groundwater level due to dewatering the Vashon Aquifer. This could significantly affect surrounding vegetation and increase fire danger for our residents, homes, and businesses. It would dry up the seeps along the Sequalitchew Creek Trail, causing the hillside slopes to dry up. I walk this trail with my dogs every week. I love to hear the babbling of the Sequalitchew Creek alongside the trail. If the South Parcel mine expansion receives a permit the creek water alongside the trail would go dry for almost half of the year. Currently, the underground water from the Vashon Aquifer feeds the lush hillside as well as the creek and our wetlands. Please DO NOT approve a mining permit that will destroy our stream, our hillside, and our wetlands IN PERPETUITY. No mitigations exist, nor is any mitigation proposed, that would protect our environment.

The projected drop in the groundwater level of up to 9 feet in Edmonds Marsh is of specific concern. Other areas of concern include the drop in groundwater level in Pond Lake, wetlands 8, 9, and 10, and Old Fort Lake. Additionally, the elimination of the Kettle Wetland and the drying up of seeps and springs feeding Sequalitchew Creek are troubling. This drop in groundwater level will likely dry out the vegetation surrounding the City of DuPont. Climate conditions have worsened since the 2011 Settlement Agreement was prepared. The City of DuPont is surrounded by forests, and climate change is already increasing the risk of fire to our residents. The resulting decrease in the groundwater level from the mine expansion will likely put DuPont residents at an even greater risk of fire danger.

Restoring Sequalitchew Creek does not have to depend on dewatering the Vashon Aquifer. It should be restored without dewatering the Vashon Aquifer. In fact, CalPortland could be a great community partner by funding the restoration WITHOUT dewatering the aquifer. As outlined above, the decrease in groundwater level throughout the area will likely have a significant negative environmental impact on our wetlands, vegetation, and wildlife.

Thank you!
Concerned Citizen

(SEPA2021-002 comment period 6/14/2024-7/15/2024)

RECEIVED
JUL 11 2024
CITY OF DUPONT

To Director Barb Kincaid, July 8, 2024

This letter is in regards to the Pioneer Aggregates South Parcel Project.

For the following reasons, it is my recommendation to adopt Scenario A, No Action- continuation of existing conditions.

1. Cal Portland has stated that with this alternative they can continue to operate for up to 10 years. This will allow the governing bodies to re-evaluate any future prospect to mining.

2. Pioneer Aggregates leases the land they are currently mining from Weyerhaeuser. Weyerhaeuser is a committed steward of our forests, which provide broad societal and ecological benefits such as clean water and air, wildlife habitat, and opportunities for recreation. The Pioneer Aggregates South Parcel Project is clearly in contrast to the landowners own conservation goals.

1 EA

3. Using the Washington State Growth Management Act for the **"Proposed action Alternative 1"** is not a valid reason to destroy a significant natural resource. There are approximately 24 active permitted Sand and Gravel mines within Pierce County. The current plan for the South Parcel is to drill 66 wells along the property boundary and just 100 feet from the Sequalitchew creek bed. This will dewater the Vashon Aquifer. In this current plan clean potable water from the aquifer will be used to wash the rock. The water from the wells is then to be deposited into the current mine. The original 2011 agreement was to deposit the water into Edmonds Marsh.

2 DS Cal

4. Climate Change. Washington State has been in a continual drought pattern for the past decade. **An Aquifer is not replaceable**. With our lack of snowfall in the winter months and the higher temperatures in the summer we could see significant changes in our natural environment and water supply in and surrounding the city of DuPont without the dewatering of the Aquifer. In the current plan the setbacks for around water sources should be increased to at least 300 feet.

3 DS

5. Much of the current proposal is based on old and outdated information and the State of Washington environmental regulations are currently changing. The City of DuPont is also in the process of updating Comprehensive Plan and zoning requirements for future development.

4 DS Cal

6. A Conifer forest covers most of the Expansion Area of the site which is 188 acres that would be cleared for mining. A total of 116 mature trees will be removed. The DEIS states that the canopy coverage of the trees within the forest does not meet the required WDFW criteria for priority habitat. With our current climate and limited forest areas in and around DuPont any canopy coverage is better than no coverage and should be re-evaluated. The proposal of replacing the landmark trees without the ground water to support them is not a viable plan. Our current foliage cannot survive with rainwater alone. Already the younger trees and foliage that do not

5 EA Cal

receive regular watering within the city are displaying stress and becoming susceptible to decease and fire.

5 cont

7. In their own words; The Kettle Wetland will be eliminated and reduce bird breeding, wintering, and migration habitat. In the proposed plan the East and West Edmond Marsh and the dependant wildlife will be drastically impacted. Groundwater seeps that support the hydrology of these wetland would be reduced, resulting in a reduction of loss of wetland habitat. This will eventually convert the wetland habitats to shrub-scrub habitat. The majority of individual mammals would disperse into adjoining habitats. However, some of the individual mammals could perish.

6 EA

8. The Western Gray Squirrel is a state threatened species, and is documented within the site vicinity. This species favors Garry Oak woodlands as prime habitat. This species also forages with coniferous forests that occur near and Garry Oak trees. The City of DuPont is well known for the preservation of the Garry Oak Trees. The DEIS suggests that the Western Gray Squirrel population on JBLM is not likely to migrate into the south parcel because of the freeway. The DEIS neglected to state that JBLM land abuts the current mining operation and that there are under freeway passages for wildlife to transition through. As has been reported with many other animal species this is not a valid scientific reason for not identifying Western Gray Squirrels in the area.

7 Cal EA

9. The South Parcel is mapped by WDFW as priority habitat biodiversity areas and corridor. The Forested riparian habitat of Sequalitchew Creek and the forested hillsides of Puget Sound near where mining is proposed are also mapped as priority habitat biodiversity areas and corridor.

8 EA Cal

10. There are no binding words that state when they close the operation that they will do any of the proposed repairs to the land stated within the DEIS. The Forest would take generations to repair and the wetlands would never be the same.

9 Cal

11. On January 14, 2014 The South Puget Sound Salmon Enhancement Group made recommendations for a restoration plan for the Sequalitchew Creek Watershed. After reviewing this plan I found it to be a sound comprehensive plan for the future of the Watershed. This plan is not based on any future mining operation. This restoration plan is expensive and will take time and resources to implement. This plan can be adopted as a separate future proposal. I feel that the resources can be achieved without the financial input from Cal Portland and should not be the purpose to approve the mine expansion.

10 DS Cal

Thank you for allowing community input into this process.

Resident of DuPont
Robin Barrow

RECEIVED
JUL 11 2024
CITY OF DUPONT

To Director Barb Kincaid, July 10, 2024

This letter is in regards to the Pioneer Aggregates South Parcel Project.

This letter addresses Chapter 3; Plants and Animals; Page 3.6-11 and 3.6-12.

Washington Department of Fish and Wildlife Priority Species

The Western Gray Squirrel (Sciurus Griseus), was listed as an endangered species on November 17, 2023. The population is suspected to be as little as 450 to 1400 within the state. There is only one area west of the Cascade Mountains where these squirrels are found. This squirrel favors the Oregon White Oak also known as the Garry Oak (Quercus Garryana), woodlands as prime habitat. This habitat occurs within the South Parcel area as well as adjacent sites within the DuPont City Limits. This squirrel also forages within coniferous forests that occur near Garry Oak trees.

The Chapter in the DEIS has incorrectly stated that the habitat for the Western Gray Squirrel is not present on the South Parcel or the surround area because it cannot cross the interstate. This is a false statement. There is an abundant habitat both within the project area and in the surrounding forests. The Western Gray Squirrel has been identified within the DuPont City Limits. They are known to travel anywhere from 8 to 14 miles to forage. This population of squirrel was introduced to the southern Puget Trough in 2007 on Joint Base Lewis McCord. The Washington Fish and Wildlife have worked closely with the Forest Management on the base and the population of the squirrel is stable. However, as an Endangered Species we must continue to protect this valuable habitat. The trees on the South Parcel are the perfect mix of habitat for the Western Gray Squirrel and should not be disturbed. The Western Gray Squirrel sleeps in tree nests during the winter and only venture out in the early morning and evening. Instead of hibernating, they rely on sheltered nests in trees and fat reserves and stored food to survive the long winter. In this area the winters are not as harsh as mountain regions such as east of the Cascade Mountains. This allows for better habitat survival. With the help of the WDFW and JBLM Forestry Management we can increase the habitat of the Western Gray Squirrel and ensure its survival in the Puget Sound area. To help preserve their habitat we can protect oak and conifer tree stands from development, wildfires and harmful timber practices. Use signing to reduce road mortality and educate our community on how to protect these squirrels. We can provide shelters by leaving large trees for them to nest in.

1 Cal EA

There are penalties for taking of individual mammals designated as Endangered. 1st conviction is a gross misdemeanor, 2nd conviction is 5 years is a class C Felony.

Please take the Endangered Western Gray Squirrel and this valuable Habitat here in the City of DuPont into consideration when considering any development or the mining project.

Thank You,
Robin Barrow

If you have concerns regarding the EARTH, please describe them below.

Once again we are in the midst of a heat wave ,lack of water (Mercer island) ,fires, people setting fires ....houses are close here , we moved here for the rain .... Animals and birds are counting on our fresh water availability as are we . The thought that some money chasing Goliath can literally go in and" steal "our water so easily with little regard for the people that live here is troubling..... Money talks .I hope David has a chance at winning this mess .

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

I have allergy issues with dust , daughter in law, has asthma and our grandson born at 341/2 week has tiny little lungs that need fresh air ....

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

The loss of the aquifier is terrifying , where are we magically going to come up with a basic human need just like air above . Honestly who willingly , joyfully would sign up for something that is there to protect us .... Not the people here that value our communities well being ..... but the people who don't live here, don't care about out local situation , but come from close and faraway places to take advantage of our limited natural resources. Our aquifier is needed to keep our ecological balance in check .... Really don't look forward to becoming the next California/Vegas dust bowl , would love to have a a healthy environment for our grandchildren to enjoy .

3 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

We have lived here for 7 years . In that short time we have noticed the number of birds has lessened in our backyard fewer small animals, walking the trails. we need the trees to help eat up the carbon dioxide we already have, due to our proximity to I-5. Plus all the traffic going back to the big boxes .....we need those TREES.

4 EA

If you have concerns regarding NOISE, please describe them below.

I mean we already are off I 5 ....do we want anymore noise ? I think not . But more concerned about air and water .....

5 EA

If you have concerns regarding LAND USE, please describe them below.

Something having a lot less impact on our local resources and quality of life . Additional Dirt, dust and noise . How exactly will this benefit the people of DuPont ? I would be willing to pay a bit more in taxes to keep the way of life here ....just don't know why any locals would want to have any developer using our natural resources, under our homes , schools and businesses, pretending like they are doing us a favor .? No thank you ! We are a Small town . We should have a say in what happens here .

6 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

Aesthetics would be to leave it in its natural state ,..... can't beat the beautiful trees , blue skies and let the creek run to nurture the animals and birds . Love hearing the soft rippling of the water .... Which is why that aquifier and marsh are so important .

7 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

It is not just the people that live here that are affected by this terrible idea .... Many people from outlying communities , and people passing through enjoy walking the sequalitchew trail with friends and family getting fresh air and exercise .we need more places like this . To take away this all positive, local opportunity is horrific .Bottom lines though , it's all about fresh air and water .....

8 EA

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

How short-sighted does someone have to be to realize that this is a truly terrible idea?!?
The damage to the marshes will be irreversible. Marshes are important not only for the wildlife that depend on that environment but also for keeping a more stable humidity level in that area which becomes more and more important as our climate continues to warm.

1 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Another terrible outcome for our area streams, particularly Sequalichew Creek. Not only does that creek provide water for the wetlands below but that whole area is an important part of your park system and provides a cool and green place for many of us to go as our world continues to warm.

2 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Same as comments above.

3 DS EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

Please keep in mind that one company's profits are temporary but these changes to our environment are permanent.

4 DS EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

Even though I don't live in Dupont, I come there often to enjoy your parks, restaurants, and merchants.
Please do everything you can to keep this from happening!

5
EA

If you have concerns regarding the EARTH, please describe them below.
If you drain the water then the plants and soil in the area will also dry up. Killing plants for some gravel is not acceptable. 1 DS EA

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
Yes don't drain the water. We don't know the long effects of doing this. 2 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
We have multiple animals in the area that use this water as a living resource. 3 EA

If you have concerns regarding NOISE, please describe them below.
Yes I don't want loud trucks picking up gravel nor do I want to see them in a beautiful community. 4 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.
Drying up the water will make plants die. Also the water is a beautiful site that DuPont should be proud of. 5 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have concerns regarding the EARTH, please describe them below.

The implications of drying up the Vashon Aquifer and the West Edmonds Marsh will negatively impact the ecosystem which makes the Sequalitchew Creek trail such an enjoyable walk.

1 DS

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

One of the things that set Dupont apart for us when we moved here 15 years ago was the abundance of trails through the lush forests of western Washington. If the water disappears and the creek is dry for half the year, I'm concerned it'll ruin one of the best trails in the NW

2 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding the EARTH, please describe them below.

I am extremely concerned about the proposed CalPortland South Parcel mine expansion and its impact on the groundwater level due to dewatering the Vashon Aquifer. This could significantly affect surrounding vegetation and increase fire danger for our residents, homes, and businesses. It would dry up the seeps along the Sequalitchew Creek Trail, causing the hillside slopes to dry up. I walk this trail with my dogs frequently . I love to hear the babbling of the Sequalitchew Creek alongside the trail especially after it has rained. If the South Parcel mine expansion receives a permit the creek water alongside the trail would go dry for almost half of the year. Currently, the underground water from the Vashon Aquifer feeds the lush hillside as well as the creek and our wetlands. Please DO NOT approve a mining permit that will destroy our stream, our hillside, and our wetlands IN PERPETUITY. No mitigations exist, nor is any mitigation proposed, that would protect our environment.

1 EA DS

If you have concerns regarding the AIR QUALITY, please describe them below.

All the truck traffic from cal Portland trucks (if approved) will be bad for our air quality. On hot days we can smell terrible smells (low tide) if this creek is drained will it produce similar smells?

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

The projected drop in the groundwater level of up to 9 feet in Edmonds Marsh is of specific concern. Other areas of concern include the drop in groundwater level in Pond Lake, wetlands 8, 9, and 10, and Old Fort Lake. Additionally, the elimination of the Kettle Wetland and the drying up of seeps and springs feeding Sequalitchew Creek are troubling. This drop in groundwater level will likely dry out the vegetation surrounding the City of DuPont.

3 DS

Climate conditions have worsened since the 2011 Settlement Agreement was prepared. The City of DuPont is surrounded by forests, and climate change is already increasing the risk of fire to our residents. The resulting decrease in the groundwater level from the mine expansion will likely put DuPont residents at an even greater risk of fire danger.

4 DS Cal City EA

Restoring Sequalitchew Creek does not have to depend on dewatering the Vashon Aquifer. It should be restored without dewatering the Vashon Aquifer. In fact, CalPortland could be a great community partner by funding the restoration WITHOUT dewatering the aquifer. As outlined above, the decrease in groundwater level throughout the area will likely have a significant negative environmental impact on our wetlands, vegetation, and wildlife.

5 DS Cal City EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

The projected drop in the groundwater level of up to 9 feet in Edmonds Marsh is of specific concern. 7 EA

If you have concerns regarding NOISE, please describe them below.

I feel if this is approved the noise will be increased. Will they be operational 24/7? We already get lots of noise from warehouse delivery trucks. We don't need anymore trucks which creates noise and pollution

8 EA

If you have concerns regarding LAND USE, please describe them below.

Currently the trail is one of the wonders of dupont. If this project is allowed to move forward it will change the serene nature of the land area.

9 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

Our creek trail is one of the most serene and peaceful trails in the area. Please don't allow this visual paradise to be changed. It's home to so much wildlife

10 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

How does the Nisqually tribe feel about this project? This area has lots of history and cultural significance it would be a shame to have this effected if the project is allowed to move forward

11 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

Having this project (if approved) so near condos/homes would be so sad. We don't need anymore truck traffic

12 EA

If you have OTHER concerns not listed above, please describe them below.

Please DO NOT ALLOW CAL PORTLAND do this to our creek! This creek/trail is used by ALOT of people and they should not be allowed to move forward with this project!

13 EA

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

Public Statement Against Mining Based on the Draft Environmental Impact Statement

Dear Members of the City Council and Community of DuPont,

As a long-term resident of DuPont since 2013 and a current master's degree candidate in environmental science policy and management, I am deeply concerned about the proposed mining expansion detailed in the Draft Environmental Impact Statement (DEIS) for the Pioneer Aggregates South Parcel Project. This project plans to extend mining operations to previously undisturbed areas and to deepen mining activities within existing sites. The dewatering process, which involves the removal of significant amounts of groundwater from the Vashon Aquifer, poses a severe threat to our local water systems. Specifically, this will cause Sequalitchew Creek to dry up for nearly five months each year. Sequalitchew Creek is not just a waterway; it is a vital ecological asset and a cherished natural feature of our community. Its seasonal flows support a diverse array of wildlife and contribute to the overall health of our local ecosystem.

1
DS
EA

The DEIS identifies several significant adverse impacts associated with this project. Key concerns include:

- **Environmental Degradation**: The expansion into previously undisturbed areas threatens local ecosystems, including plant and animal habitats. Such disruption can lead to long-term ecological imbalances.
- **Water Quality Risks**: Both groundwater and surface water resources are at risk of contamination from mining activities. The DEIS highlights potential negative impacts on water quality, which could affect residents and wildlife reliant on these water sources.
- **Increased Air Pollution**: The project is expected to elevate levels of dust and other airborne pollutants, impacting air quality, and posing health risks to nearby communities.
- **Noise Pollution**: The increase in mining activities will result in higher noise levels, affecting the quality of life for residents in the surrounding areas.
- **Visual and Aesthetic Impact**: The expansion of the mining site will alter the landscape significantly, diminishing the natural beauty of our community and potentially affecting property values.

2
EA

The proposed Pioneer Aggregates South Parcel Project must not be allowed to prioritize profit over the well-being of our environment and community. We urge the decision-makers to consider the long-term impacts of this project and to protect our natural

3
EA

resources by denying the dewatering request. Given these substantial environmental and social impacts, I urge the City of DuPont to reconsider this project. Sustainable alternatives that do not compromise our environment and public health should be prioritized. Protecting our natural resources and supporting the well-being of our community must remain our top priority.

3 cont.

Let us come together to ensure that our community and environment are preserved for future generations.

Sincerely,

Alicia Brewer

504 Louviers Ave

DuPont, WA 98327

If you have concerns regarding the EARTH, please describe them below.

I've lived in DuPont for 6 years now and the Sequalitchew Trail is one of the greatest things in this town. The water, wildlife, and lush, green shrubbery are what make it so wonderful. Please do not allow another beautiful place be sullied in the name of profit.

If you have concerns regarding the EARTH, please describe them below.

The DEIS for the proposed dewatering of the Vashon Aquifer to mine more gravel in DuPont states clearly that, “Drawdown of the Vashon Aquifer is anticipated to affect groundwater and surface water features (streams and wetlands) within a one to two-mile radius from the proposed mine site.”

Fire concern CalPortland’s request to dewater the Vashon Aquifer will destroy our wetlands, marshes, creek, and surrounding environment.

1 DS

If you have concerns regarding the AIR QUALITY, please describe them below.

CalPortland mining will increase particulate matter in our surrounding residential areas. This will affect our a vulnerable population of young and elderly with respiratory health issues. The dust surrounding the existing mine speaks for itself.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Dewatering the aquifer is against Dupont city law. There is no mitigation.

3 DS City

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

The DuPont Municipal Code 25.105.050 Critical Areas clearly states:

“Wetlands in DuPont have a positive effect on water quality downstream or in aquifers by removing pollutants through the processes of sediment trapping, nutrient removal, and chemical detoxification. Wetlands also regulate the flow, retention, and release of stormwater to surface and groundwater systems."

4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

The decrease in groundwater will lead to the loss of vegetation, loss of stream flow, loss of habitat, and decreased ability to remove pollutants. It will add drought-like conditions to the Sequalitchew Creek Ravine.

5 DS

If you have concerns regarding NOISE, please describe them below.

It will impact the community garden surrounding area.

6 EA

If you have concerns regarding LAND USE, please describe them below.

It is way too close to residential living area. It is way too close to our Dupont community garden. This garden donates 50% of produce grown to food banks in Thurston and Pierce county. What impact will pollution from the mine have on these surroundinh areas.

7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

It will permanently change the master planned community of Dupont from inception.

8 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

ANOTHER OFFICE/WAREHOUSE HAS BEEN APPROVED
FOR DuPONT (LOT Y)
Construction will require relocating the Sequalitchew Creek trail and elimination of many evergreen trees. Just imagine what that concrete structure will look like across from our civic center. The concrete floor will permanently cover and eliminate access to the original historic and prehistoric sites that are important to our local cultural heritage. And, of course, the truck traffic is just going to be outstanding.

9 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

Increased truck traffic and vehicle exhaust pollution from it on Powerline road and Center Drive

10 EA

If you have OTHER concerns not listed above, please describe them below.

West Edmonds Marsh groundwater level will decrease by 9 feet

• Pond Lake water level will be reduced by 2 feet

• Wetlands number 8, 9, and 10 water levels will be reduced by 1 foot

• Old Fort Lake will be reduced by 0.05 feet

• The Kettle Wetland will be eliminated

• The seeps and springs that feed Sequalitchew Creek will dry up

11 DS

If you have concerns regarding the EARTH, please describe them below.
I'm not okay with the impact this will have on the vegetation on our city's precious Sequalitchew creek waterway

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.
Will increase risk of wildfire

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
Limited resources do NOT want to expend on a mining land stripping operation

3 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
Sequalitchew creek is beautiful year round. This will have a HIGE adverse impact on that

4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding NOISE, please describe them below.
More mining inevitably leads to more noise on the quiet trails and homes of Dupont

5 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

Letter 39

Dear Director Kincaid,
I find this so very frustrating that we are "here" once again with the South Parcel mine expansion proposal from CalPortland, that would greatly impact the groundwater level by their dewatering the Vashion Aquifer. We continue to have to fight for our health and well-being in our beautiful city of DuPont, Wa. 1 EA

As I did some research on the effect from gravel pit mining, I found some very interesting facts that negatively affects our health, our eco-system, and the loss of biodiversity.
Here are some of the significant effects that this company has and wants to continue in our city:

RECEIVED
JUL 15 2024
CITY OF DUPONT

Toronto Environmental Alliance
The Environmental Impacts of Aggregate Extraction:
"Pits or quarries requires the removal of virtually all natural vegetation, top soil and subsoil to reach the aggregate underneath. Not only does this lead to a loss of existing animal wildlife, it also leads to a huge loss of biodiversity as plants and aquatic habitats are destroyed. Moreover, adjacent eco-systems are affected by noise, dust, pollution and contaminated water.

Pits and quarries disrupt the existing movement of surface water and groundwater; they interrupt natural water recharge and can lead to reduced quantity and quality of drinking water for residents and wildlife near or downstream from a quarry site. (The runoff depletes the oxygen in the water for the marine life in our Puget Sound.)

Destroyed ecosystems and source water aquifers are irreplaceable. This is not an interim land use. The landscape is blotted with destructive pits and quarries, and species of all kinds endure permanent negative impacts.

Naturally, each pit or quarry has unique characteristics and impacts, but every pit or quarry will degrade the natural environment. For pits or quarries situated on lands designated as ecologically significant, this degradation has an even greater adverse impact. 2 EA

For communities, the displacement of water resources is one of the biggest concerns pits and quarries pose. However, there are many other concerns. Beyond the physical changes to the landscape, the daily barrage of noise, dust and exhaust produced by hundreds of dump trucks hauling aggregate can have serious effects on the health of people living nearby. "

If the floodplain aquifer discharges into the stream, groundwater levels can be lowered because of channel degradation. Lowering the water table can kill riparian vegetation.

What are others danger of gravel pits?
Crystalline Silica Dust.
Breathing crystalline silica dust can cause silicosis, which in severe cases can be disabling, or fatal. The respirable silica dust enters the lungs and causes the formation of scar tissue, reducing the lungs ability to take in oxygen.

These are facts, and when this company and its operation decimates our environment, it is irrevocably damaged and can never be brought back, not the beautiful Sequalitchew Creek, the Kettle Wetland, the Edmonds Marsh, the many birds and mammals, or the multitude of plant life, as well as, our health and well-being.
We are not the only city in the United States that is facing the same dilemma on how to allow businesses to operate within each or our cities. We are seeing, feeling, and are experiencing the negative effects of these mining operations in our own city. And, we are planning to add more than 2000 more housing in our city, which impacts our ability to supply our citizens with clean healthy water. This approval would be disastrous to our city and to the surrounding communities. 3 EA
Please do not grant approval of CalPortland's proposed expansion of their mining operation.

Thank you, Kate and Mike Burch

Kate Burch Michael W Burch

If you have concerns regarding the EARTH, please describe them below.

I am.deeply concerned about the environmental degradation liklihood of this project. Specifically related groundwater/aquifer recharge and flora and fauna in Sequalitchew Creek riparian areas and Puget Sound shorelines.

1 DS EA

If you have concerns regarding the AIR QUALITY, please describe them below.

I believe expanding the mining operation will increase air and noise pollution and could compromise sensitive populations

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

This will dramatically impact the aquifer recharge zone and deplete previous water resources. As this are continues to expand we cannot afford to waste water resources on mineral extraction.

3 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

I love Sequalitchew Creek and visit the trail/beach often. This plan would destroy what is left of this natural and cultural resource

4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

The mine expansion would compromise quality habitat for other species

5 EA

If you have concerns regarding NOISE, please describe them below.

Dupont as a landscape has changed (population, community desires, emvironmental stewardship, etc) and needs a serious shift from industry oriented business to maintain and promote the core values of our city.

6 EA

If you have concerns regarding LAND USE, please describe them below.

Dupont needs to decide where are our priorities for the remaining portions of unused land and manage them accordingly.

7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

I don't want to look at a gravel mine operation while utilizing public resources (Sequalitchew).

8 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

I would deman a cultural artifact study be completed in this area prior to any development, particularly in relationship to tribal resources

9 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

The last thing we need is MORE trucks driving through our town

10 EA

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

I do not support lowering the ground water level to extract more gravel at the pit. This will have long term, negative environmental impacts for short term gains for one company. The Mounts Road community are on wells that are impacted by development in DuPont and any significant reduction in groundwater is of significant concern to us.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

Very concerned about increased fire danger resulting from mine expansion and its impact on the groundwater level due to dewatering the Vashon Aquifer. This could significantly affect surrounding vegetation and increase fire danger for our residents, homes, and businesses. It would dry up the seeps along the Sequalitchew Creek Trail, causing the hillside slopes to dry up.If the South Parcel mine expansion receives a permit the creek water alongside the trail would go dry for almost half of the year. Currently, the underground water from the Vashon Aquifer feeds the lush hillside as well as the creek and our wetlands. Please DO NOT approve a mining permit that will destroy our stream, our hillside, and our wetlands IN PERPETUITY. No mitigations exist, nor is any mitigation proposed, that would protect our environment.
The projected drop in the groundwater level of up to 9 feet in Edmonds Marsh is of specific concern. Other areas of concern include the drop in groundwater level in Pond Lake, wetlands 8, 9, and 10, and Old Fort Lake. Additionally, the elimination of the Kettle Wetland and the drying up of seeps and springs feeding Sequalitchew Creek are troubling. This drop in groundwater level will likely dry out the vegetation surrounding the City of DuPont.

1 DS EA

2 DS

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If the South Parcel mine expansion receives a permit the creek water alongside the trail would go dry for almost half of the year. Currently, the underground water from the Vashon Aquifer feeds the lush hillside as well as the creek and our wetlands. Please DO NOT approve a mining permit that will destroy our stream, our hillside, and our wetlands in perpetuity. No mitigations exist, nor is any mitigation proposed, that would protect our environment.
The projected drop in the groundwater level of up to 9 feet in Edmonds Marsh is of specific concern. Other areas of concern include the drop in groundwater level in Pond Lake, wetlands 8, 9, and 10, and Old Fort Lake. Additionally, the elimination of the Kettle Wetland and the drying up of seeps and springs feeding Sequalitchew Creek are troubling. This drop in groundwater level will likely dry out the vegetation surrounding the City of DuPont.

3 DS

4 DS

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

Climate conditions have worsened since the 2011 Settlement Agreement was prepared. The City of DuPont is surrounded by forests, and climate change is already increasing the risk of fire to our residents. The resulting decrease in the groundwater level from the mine expansion will likely put DuPont residents at an even greater risk of fire danger.

Restoring Sequalitchew Creek does not have to depend on dewatering the Vashon Aquifer. It should be restored without dewatering the Vashon Aquifer. In fact, CalPortland could be a great community partner by funding the restoration WITHOUT dewatering the aquifer. As outlined above, the decrease in groundwater level throughout the area will likely have a significant negative environmental impact on our wetlands, vegetation, and wildlife.

5 City EA

If you have concerns regarding the EARTH, please describe them below.
The DuPont geographical boundaries are for the most part beautiful and lead to stunning hidden trails, wildlife and views. The warehouse industry along with other large industry that will interfere with our landscape is devastating. DuPont has the capacity to support small to mid size business and drive more business to existing hotels through incentives and other programs. Why invest in Corporations who have more political power and can change the way this beautiful community looks and feels.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.
Additional dust in the air and large vehicle traffic emissions effect air quality and wildlife habitations

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
As stated above; all large corporate industry will change the ecological balance of the DuPont landscape as stated above; all are interconnected

COMMENTS - Reference Proposed Opening of the South Parcel of the Pioneer Mine for Digging.doc 39.5KB

(SEPA2021-002 comment period 6/14/2024-7/15/2024)

Although we are Lakewood residents we have on several occasions visited ***Sequalitchew Creek Trail*** to find and identify fungi/mushrooms for the ***North American Fungal Diversity Survey***, a ***North American Mycological Association*** (**NAMA**) project, and we have had the pleasure of having discovered several species that are unique to this area.

Be advised, Jen and I are amateur mycologists, belonging to these organizations:

- ***NAMA***
- ***Puget Sound Mycological Society***
- ***South Sound Mushroom Club***,

We have **13 years** of Mushroom Hunting experience behind us, starting in 2011 when we were focusing on edibles. However, starting in 2018 we became much-more interested in non-edible fungi, and since then have found, identified, and recorded *Site Location & Field Details Data*, *Morphological Descriptions*, along with *In-Situ and Detailed Photos* for **459 Fungal observations** on the ***iNaturalist*** website, including **294 First-time Fungal Observations** on unique species. Of those **Fungal Observations**. **129** have achieved a "***Research Grade***" **designation** because **at-least-3** other ***iNaturalist*** **users *have confirmed*** the ***species*** name we provided. We have also found around 12 fungi that had never been identified or rarely recorded for existing n the Pacific Northwest.

So, what got us started in looking at ***all*** fungal specimens we found? On our first foray Jen found what is likely a ***new fungal species***….in fact through DNA testing we discovered that she had discovered the ***very first*** existence and recording of the species ***Hygrocybe phaeoccocinea*** in the Continental US !! Since that time we have used every opportunity to explore anywhere we legally can to find some more rare/new fungal species….that includes the **Sequalitchew Creek area**.

Since 2018 my wife and I have taken FIVE trips to explore both the Eastern and Western areas of ***Sequalitchew Creek***, including the original Nisqually Fort property. During those self-guided trips we have found **30 fungal species** unique to that area **including** some of the grounds that are known as the ***South Parcel, Pioneer Aggregates Mine***.

SEQUALITCHEW CREEK AREA FORAYS:

- 13 OCT 2018, 4 Species
- 18 NOV 2019, 7 Species
- 28 JUN 2020, 6 Species
- 13 APR 2021, 8 Species, including the Mine area
- 19 OCT 2021, 5 Species, excluding the Mine area

1 EA

Now, had we known that a good portion of the area we had previously explored was potentially going to be razed for mine-expansion, we would have spent more time there. Being unaware of that possibility we spent only one foray into that area during the Spring of 2021, yet had a very good impression that grounds there had very-good potential of being

excellent for Fall Fungal Harvests….mainly due the extensive moss-covered areas and plenty of other features that fungus like, particularly good amounts and sizes of conifers, along with copious amounts of Dead fall. Unfortunately, FALL 2021-2023 were a "bust" for fungal pursuits due to inadequate rainfall, and we found that to be the case in nearly all of our favorite foray areas here in WA.

Bottom Line…..we have a very-real apprehension about the potential loss of habitat for fungi and the natural systems they support...of not only the mine area, but surrounding grounds near there. **Remember**….in just ***ONE Spring*** Foray, in what was essentially a poor Spring Mushroom Season, we **still managed to find EIGHT (8) SEPARATE SPECIES in the SOUTH PARCEL AREA**. 2 EA

Considering our 13-years of Pacific NW Fungal Pursuits, with proper weather conditions, we are ***ABSOLUTLEY certain*** we would have found ***many*** who-knows-what Fungal Species, with the distinct possibility of a new species for the Pacific NW, if not the world. And, now, we are possibly going to allow the destruction of this area?

The South Parcel Area Potential. That entire area is covered for-the-most-part by 2nd-growth conifers, predominantly Douglas Firs. The ground itself is thick with moss beds, and underneath that the ground is loaded with nutrients necessary for both Fungal and Floral growth. Based on our 13-years of experience in many Pacific Northwest Fungal Foraging environments, all of these natural features found in the ***South Parcel Area*** are ***perfect for Fungal Growth*****:** from Late August, all the way into January….depending on the weather. In other words, Late Summer thru Early Winter, when the temperature and rains are most-conducive to making the environment ideal for Mycelial growth.

Our major distress is the impact on the forest and water areas this mine-expansion will likely cause as well as the concomitant effects on these **PRIMARY *LIFE*** areas: 3 EA

- Surface/Ground Waters
- Soil Nutrients/Depth
- Fungi (Mushrooms)
- Flora (Plants)
- Fauna (Animals)
- Fisheries
- Air Quality
- Land and Shoreline Use
- Mitigation Measures

Especially concerning is the effect on Fungi….an ***equally*** important element-of-life on our planet. One has to understand that elimination / contamination of areas that support fungi has **WIDE-RANGING ECOLOGICAL IMPLICATIONS**.

One must be aware what the term “fungi” really covers. This general, and usually misunderstood, term is actually referring to the component which is the actual living-being and is called “***MYCELIA***”. What you see in the store, called ***Mushrooms***, is only the edible portion produced by those Mycelia, ***MYCELIA***, are like trees and other plants, BUT they grow either underground or within some entity that feeds it. The Mushrooms they produce and usually visible are the **FRUIT** of the fungal species. These Mushrooms contain what we call ***SPORES***, somewhat like the seeds found in the fruit and vegetables we eat nearly every day.

Fungi feed the land and environment in two ways thru their **Mycelia** (hyphae/roots) that can cover 100’s to even 1000’s of acres underground. There are two ***Primary Types*** of ***Fungi***:

1) **Symbiotic**, where the Mycelia exchange water and nutrients with plants (i.e., trees, bushes, flowers, grass, moss….any living organism that the Mycelia can connect with, (i.e., like roots) providing those living beings with the water and elements necessary for plant growth. This allows plants to perform their absolutely essential work of releasing Oxygen to and removal of Carbon Dioxide of the Earth’s “Air”. The Mycelia, in turn/ receive sugars and other nutrients from the plants. Most interesting is that particular fungi will have a symbiotic relationship with only a certain plant or tree and share it with no other. 4 EA

2) **Saprophytic**, where the Mycelia break down non-living matter (i.e., wood, leaves, cones/seed pods, grass, scat, carcasses…..i.e., dead things) releasing carbon and nitrogen back into the soil, providing nutrition and an environment that is receptive to new plant growth.

For instance, the largest known “living organism” on planet earth is a fungus/mushroom species belonging to the *Armillaria* genus which is living in a mixed-conifer forest in the *Blue Mountains* of northeast Oregon. It is colloquially called the “Oregon Humongous Fungus”, and according to the ***US FOREST SERVICE,*** it has set the record as The ***LARGEST SINGLE LIVING ORGANISM ON EARTH***, covering an area of 2,385 acres, or about 3.7-Square-Miles.

What ‘**IF**’ there is **ANOTHER FUNGUS/MUSHROOM OF EQUAL/MORE-EQUAL IMPORTANCE, LIVING, YET UNDISCOVERED WITHIN THE BOUNDARIES of the *South Parcel of the existing Pioneer Aggregates Mine area***.

Again, based on our 13-years of experience in Fungal Research we are certain that approving this expansion will have serious deleterious effects on the environments of ***BOTH*** the mining parcel as well as surrounding areas that depend on the ecologically important assistance provided by Fungi.

One other consideration….in the most-recent extension of the Dupont Mine, the ***2011 Settlement Agreement for the DuPont Mine Agreement***, indicated several mitigation efforts 5 DS

were ***supposed*** to have been done: "Restoration of Sequalitchew Creek Watershed, and Preservation of Puget Sound Shore-lands and Adjacent Open Space". 5 cont

Well…..***Were they?***

Lastly, but certainly importantly, one needs to remember that Jen and I have just ***barely*** explored the ***Sequalitchew Creek Area*** for existence of Fungi, and even less so for the ***South Parcel***. Also, remember that we have been successful in finding, identifying, and recording details for 30 Fungal Species in those areas. Imagine how many other species we could find with more time. Finally, who knows what ***Sequalitchew Creek***, including the ***South Parcel*** area, might have hiding away in the form of a newly discovered species of Fungi….mayhaps one that could also be of benefit to mankind for some medical life-saving means, such as these?

- ***Psilocybe*:** this mushroom has been proven to be of use in treating our military personnel who are suffering from *PTSD*.
- ***Cordyceps*:** This fungus contains cordycepic acid and cordycepin, which may help stabilize blood sugar metabolism, and increase oxygen use, and produce ATP. It may also protect organs from heart, kidney, and liver disease. Some research suggests that cordyceps has anti-inflammatory and cancer-fighting properties. 6 EA
- ***Pleurotus pulmonarius*:** A hot-water extract of this fungus may reduce the proliferation and invasion of liver cancer cells.
- **Hedgehog mushrooms:** Some believe that Washington's hedgehog mushrooms, such as **H. washingtonianum** and Sweet Tooth (*H. oregonense*), may have anti-tumor and anti-microbial properties.

Other medicinal mushrooms include: Lion's mane, Reishi, Chaga, Shiitake, and Turkey tail.

Remember…..**penicillin** is the product of "**MOLD**" fungi…..these are microscopic fungi that grow in multicellular filaments called ***mycelium,*** which normally appear as fine, white threads on the surface of food, causing discoloration and a fuzzy appearance. Molds can be found indoors and outdoors, and have the important role in nature by breaking down organic matter, a.k.a., saprophytic fungi.

Therefore, considering what has been pointed out above, it would be a travesty to throw away these 313 acres of land to mining for gravel. Such use is limited for human-kind benefits when compared to the benefits that the presence of fungi will have. 7 EA

If you have concerns regarding the EARTH, please describe them below.
Will effect soil quality

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.
Will increase PM in the air

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
Will dry out the aquifer, effect drinking water supply and quality

3 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
Will impact the stream and damage wetlands

4 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
Will drastically impact local wildlife

5 EA

If you have concerns regarding NOISE, please describe them below.
Will increase an already problematic noise problem coming from the mining activities near solo point

6 EA

If you have concerns regarding LAND USE, please describe them below.
Land should remain as is

7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.
Will be an eye sore

8 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

Loss of wildlife to include marine and riparian species. And any other cultural resources

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

Having mining in this area will definitely affect the quality of water, earth, and soil that I depended on everyday in DuPont. it is a threat to Mother Earth and my health.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Having mining in this area will definitely affect the quality of air that I breathe everyday in DuPont. it is a threat to my respiratory health.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Having mining in this area will definitely affect the quality of water, earth, and soil that I depended on everyday in DuPont. it is a threat to Mother Earth and my health.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Having mining in this area will definitely affect the quality of water, earth, and soil that I depended on everyday in DuPont. it is a threat to Mother Earth and my health.

3 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Having mining in this area will definitely affect the quality of water, earth, and soil that fish, plants and lives depended on everyday in DuPont. it is a threat to Mother Earth and my health.

If you have concerns regarding NOISE, please describe them below.

We already have noise pollution from JBLM and law maintenance everyday here in Dupont, having gravel mining plant will add on to the noise level here on DuPont

4 EA

If you have concerns regarding LAND USE, please describe them below.

We need more plants to give us more oxygen in the air, not gravels and dust.

5 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

It doesn't take an environmental scientist to realize the deviation this project would cause. It's unlikely that mere comments can stop this project as it's already underway. If I was in the position of the land owner I can't say I would do the right thing either. Money is money. TLDR: Fucking up the riparian area is a travesty.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Can't be good

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

God help us.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

The Industrial Revolution and its consequences have become a disaster for the human race.

2 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Fuck em

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

We should just remove every tree and plant in WA. Create a 100 lane highway.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
Since DuPont relies on aquifers for our potable water, it is imperative that we keep this water supply undamaged and untainted.

1 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
I am not in favor of draining Sequalichew Creek. This biosphere with the public trail is a gem of DuPont, enjoyed by locals and outsiders alike. Without the water, plants and animals will likely be permanently damaged, completely changing the lush haven it is currently. Our marshes equally have a large range of birds, waterfowl, and animals. This ecosystem is valuable and draining it will also cause irreparable harm.

2 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
See above

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

No. This is a vital resource located in the mine area that is needed to build infrastructure and Cities across the Puget Sound Area.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

No; it is controlled by State and US Govt agencies. PSAPCA

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

No; The Vashon Aquifer is a shallow aquifer-approx 90 ft below surface. The Historic Village drew its water supply from it. Since it is shallow it prone to pollutants, when Weyerhaeuser developed NWLanding, they gave the Historic Village the opportunity to hook into the new water system since its source was drawn from a deeper aquifer. The Vashon Aquifer is not a viable source of drinking water for the City. The Vashon aquifer can be seen gushing out the side of the hill into Puget Sound at low tide walking up the beach from the mouth of the Sequalitchew Creek Trail.

3 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

JBLM/Ft Lewis put in the diversion canal at the head of Sequalitchew Lake to control water levels to protect its drinking water supply from flooding the Springs-due in part to beaver dams. Because of this action, the section of Sequalitchew Creek from West of the lake to the crest of the ravine canyon pretty much went dry. Previously, WDFW would use a daisy cutter to break up the beaver dams in this area. That has ceased. Part of this permit process is- the upper part of Sequalitchew Creek will be restored when the mining is finished in the South parcel. It's a swamp in its current situation.

4 DS

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

No. Perhaps fish runs will be restored when the restoration of the creek is finished.

5 EA

If you have concerns regarding NOISE, please describe them below.

No

If you have concerns regarding LAND USE, please describe them below.

No.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

No. The bluff will remain along Puget Sound.

6 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

No. I believe these types of surveys have to be done before there is removal of soil. And if such is found, it would be dealt with according to State law, as it has been in areas around the Old Fort Site.

7 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

I don't have concerns. The vast majority of transporting material from this area is done by barge; to the Puget Sound area. A traffic study would be done to see if the amount of traffic would increase. Commercial traffic uses Wharf Rd to Steilacoom-DuPont Rd to I-5.

8 EA

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

I'm concerned the project may disturb and distribute heavy metals left over from the former DuPont Works Site, allowing them to make their way into the water and area surrounding the project.

1 Cal EA

If you have concerns regarding the AIR QUALITY, please describe them below.

I worry that dust and particulates from the project will drift toward surrounding neighborhoods.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

I'm concerned that pumping the water from the aquifer will have permanent and unforeseen consequences to the Seqaulitchew Creek area and could potentially spread pollution into our city's groundwater.

3 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

I'm concerned that pumping the water from the aquifer will have permanent and unforeseen consequences to the Seqaulitchew Creek area. Very little water already flows through Seqaulitchew Creek. Any reduction in that flow would have dire consequences.

4 DS

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

The removal of that water will degrade the habitat for plants animals and fish that depend on that water for survival. We have already altered or developed much of the area and further development will stress wildlife. Any spills of petroleum products or sediments would decimate fish populations. Reduced water flows would also degrade conditions for salmon spawning and therefore, reduce chances for salmon recovery in the area. The removal of forested lands will remove the habitat that many animals depend upon for survival. We have very few areas like this left in our community.

5 DS EA

If you have concerns regarding NOISE, please describe them below.

This area is close to several established neighborhoods and noise from the project will negatively affect the quality of like for people and families in the area.

6 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

The quality of life in DuPont is exceptional and much of that comes from the fact that we have protected our undeveloped areas. Seqaulitchew Creek is a beautiful and beloved area for people in our area. Do we really want to risk destroying or degrading this area? The only group who benefits from this plan is CalPortland. Our community will bear the costs and consequences from this development. Once changed, the environment will never be the same. We can never go back to how things were before. We should be protecting the few wild areas we have left from projects like this so that these lands can be enjoyed and by future generations. We must act cautiously and conservatively. This project should not go forward and will negatively affect Seqaulitchew Creek.

If you have concerns regarding the EARTH, please describe them below.
Please do not expand the zones impacting our area. It is so fragile as it is. Changing the zoning could impact the western gray squirrel and other delicate species. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.
Expanding and changing the zones could increase the amount of trucks and heavy equipment moving polluting our air. 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
Ground water run off and leaking equipment could easily contaminate our water and aquifers 3 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
Do not allow them to expand any at all it could contaminate our streams and wetlands 4 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
This will impact the western gray squirrel if allowed to expand or change the zones 5 EA Cal

If you have concerns regarding NOISE, please describe them below.
I do not want to hear nor tricks and equipment in our area 6 EA

If you have concerns regarding LAND USE, please describe them below.
I do not have confidence they will be good stewards of the land here 7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.
Expanding will destroy our beautiful area. And make it an ugly pit quarry 8 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

There must be Native American artifacts that will be destroyed if this proposal is approved. These people have traveled the Sequalitchew trail area for thousands of years expanding and changing the zoning will damage undiscovered artifacts.

9
EA

If you have concerns regarding TRANSPORTATION, please describe them below.

More tucks on the roads will be an unfair burden o us residents and cause more traffic

10
EA

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

Earth is our HOME. If we continue to neglect, pollute and waste our "HOME", there will be no future for all humankind and animals. Our lives defends on it. Our future defends on it.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

To take care of our Earth, we must take care the air quality. Imagine your home is on fire, your trap, breathing smoke. What would happened next It will affect your breathing and eventually it will kill you. Having poor air quality, eventually it will KILL US ALL.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

• Sequalitchew Creek will go dry for approximately five months each year during the hottest part of the year.
• The slopes of our beloved Sequalitchew Creek Trail will go dry and vegetation will die as the seeps will be eliminated. The seeps maintain the lush riparian environment and make up the creek flow
• The water table of West Edmond Marsh will be lowered up to 9 feet. Other wetlands in DuPont will be lowered up to two feet
• The City of DuPont has used the Vashon Aquifer as potable drinking water in the past and still has a water right to the aquifer it wants to keep for future growth

3 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding the EARTH, please describe them below.

This city in its infancy spent several years and many dollars mitigating the contaminants of the powder works plant - now you want to destroy one of the most valuable natural resources we have. I am so tired of having our lives controlled by large companies- yes, we can protest, and I am, but will be surprised if it does any good.. please protect Sequalitchew and surrounding areas from this development. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

DuPont is a designated Tree City- the trees improve and sustain the air quality- destroying this habitat reduces the quality of life many of us appreciate and embrace here. 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Any intrusion on the natural flow of groundwater and acquirer is unacceptable. 3 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Most cities in this area have strict rules about destroying wetlands when it comes to development because of the intricacies of the ecosystems, yet this doesn't apply to this project? We are so fortunate to have the natural wetlands we do and should be protecting them, not destroying them. 4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

All of the above applies to this project and yes, I have serious concerns about their disruption and destruction. 5 EA

If you have concerns regarding NOISE, please describe them below.

I don't live in the area that would be affected by the noise, but feel this to be a serious concern for those who do. 6 EA

If you have concerns regarding LAND USE, please describe them below.

Northwest Landing was developed as a planned city - use of the land for the gravel mine may not be out of line, but the effects of the project alters areas that should never be touched. 7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

I don't know about the visual effects of the plant itself, but I sure as heck don't like the idea of dried up creeks and dead trees- how can that be a positive visual?

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

I don't have a specific concern in this area but expect this would also be a consideration.

If you have concerns regarding TRANSPORTATION, please describe them below.

I'm not sure how transportation would be affected.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

The aquifer will be limited water for 5 months during the warmest months and will cause the land to be more compacted and unable to absorb water as easily which puts us a greater risk for fires and floods and sinkholes as well as affecting The wildlife and the ecosystem. Decreasing the groundwater in the aquifer can potentially put more contaminants or concentrate contaminents into the groundwater and increase nitrate levels, The soil there has already had a history of contamination and so the groundwater will be more at risk once the new housing development is there if the aquifer is further mined. This negatively impacts the wildlife.

1 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Reducing the amount of water to drop the marshes, streams will negatively impact the wildlife and plant life needing the water to survive. Which will cause everything to dry up and die

2 EA

If you have concerns regarding NOISE, please describe them below.

On top of the already loud noises we get from JBLM we will.have building noises and mining noises.

3 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

What is the name of the Agency or Organization?

Department of Licensing

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

This project will drive what wildlife we have left after all the big warehouses misplaced them, further into our backyards and parks. I've lived in DuPony for 10 years. Each year I see more and more wildlife involved accidents and in my yard. This could also drive them to look for other suitable locations including crossing I5 causing serious and fatal car accidents.

1 EA

If you have concerns regarding NOISE, please describe them below.

Noise from JBLM is frequent but muffled by the trees we have left here. This project will not only remove some of that sound barrier, but will also add to the noise here.

2 EA

If you have concerns regarding LAND USE, please describe them below.

Same as above for wildlife.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

This project will increase traffic to this small community. Many children have to walk or ride bikes to school here and this could potentially mean an increase in pedestrian vehicle accidents, in addition to the air quality issues this will bring.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

I oppose the project.
Having read the Draft Environmental Impact Statement (DEIS) dated June 14, 2024, I see there would be long-lasting or permanent environmental

1
EA
DS

damages arising from the Pioneer Aggregates South Parcel Project, even after considering mitigation measures under the Significant Unavoidable Adverse Impacts (especially, Groundwater, Surface water, Fisheries, Plants & Animals). I find such damages are too substantial to ignore. It may be profitable to the project proposer and bring revenues to the City to spend, but all these profits will be made at the expense of environment. As a resident of DuPont for over 25 years, I say this is a critical moment for us to make a right decision based on the long-term consequences and protect the environment for the future generations to come.

Additionally, there are numerous reports on the irreversible damages from the agricultural and/or industrial use of aquifers, especially in the Midwest states, from drying out much quicker than the estimates studied in the past to exasperating the shortage of water under the harsh climates (heat and drought). I'm not an expert, yet it appears that estimates can be optimistic calculations and the actual courses can be worse, especially when currently unknown factors such as other adverse incidents and disasters take place. Therefore, when I read "... no significant adverse impacts are anticipated..." in the DEIS's sections (such as Earth, Air Quality, Noise, Land Use, Aesthetics, Cultural Resources, etc.) this might be the most educated opinions but yet I feel there's no guarantee that the issues would stay as non-significant in the future.

Thank you,

Kazuko Donahue

If you have concerns regarding the EARTH, please describe them below.

I am concerned about the removal of trees and the impact on soil erosion. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

I am concerned about the increased pollution from trucks and crystalline silica or other contaminants impacting our air quality. 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

In our current warming climate, it makes NO SENSE to dewater an aquifer. Western Washington is seeing increasingly hot/dry summers. We need the groundwater and water is becoming increasingly critical to the entire western US. Is there not a risk of saltwater intrusion if the aquifer is dewatered? Is there not a possibility that we forever lose access to this most precious resource? And for what? Corporate profit. Give me a break. 3 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

I am concerned that we will lose the streams and wetlands that are throughout DuPont.I'm concerned about contamination of our water as well. 4 DS

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Loss of streams/wetlands will impact wildlife. Loss of trees will impact wildlife. Industrial noise pollution will impact wildlife. 5 EA

If you have concerns regarding NOISE, please describe them below.

Don't we already have enough noise pollution from the interstate that runs through our backyards? Why should we allow more? 6 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

This will negatively impact property values of our homes. The loss of the beautiful forest and the views along the Sequalichew Creek trail is something that will fundamentally change the beauty of our city. 7 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

Ultimately, this land belonged to native peoples who were here long before us. Then this was the site of a Methodist Mission and there is a historical marker in the area. Will there still be access to this marker? Will the site be preserved, maintained, and accessible?

8 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

We have enough of a traffic problem with I-5 and Center Dr. being used as a cut-through. Then you add in construction at Station Dr. and the ridiculous number of warehouses and associated truck traffic. We want to add to this already ridiculous problem? I don't think that's fair to the citizens of DuPont who can't even drive across town without fighting traffic some days.

9 EA

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

The whole Seq. Creek trail and ecosystem is beautiful and unique to any residential/business community. We would be short sighted fools to sacrifice this pristine area.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding NOISE, please describe them below.

We already hear the metallic grinding and clicking on many nights. It's annoying.

2 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

All the items listed above make for the wonderful, healthy and unique quality of life here in DuPont. You cannot harm one of these areas without hurting the others.
Destroying the aquifer may do the most permanent damage but obliterating the esthetics and cultural significance of the area is a crime.
The quarry is already obnoxiously loud especially at night. The truck traffic is also just dangerous already.
Please don't let this quarry expansion move forward.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
I am concerned to hear that as a citizen/resident of DuPont, I would be one of many who will be losing our rights to this land as a source for potable water.

1 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
I am deeply concerned about the effect on the city's rights to this source of potable water as well as the effect of the water table lowering up to 9 feet, which would be devastating to the vegetation and habitats of the creek and trail. While there are many devastating effects of natural disasters beyond our control, this would be a completely man-made and irreversible eco disaster that is completely within your power to stop. If you could stop a drought, wouldn't you?

2 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding NOISE, please describe them below.

I am concerned about noise affecting our quality of life and value of the home I own in DuPont. I purchased in palisades last year specifically to get away from the mortar sounds we heard regularly where we lived before off Hoffman Hill and it scared our dog who is our family. We literally moved/purchased to get a quieter environment and I hear this will affect that. Please do not allow mining.

RECEIVED
JUL 2 2024
CITY OF DUPONT

Letter 71

July 1, 2024

Dear Director Kincaid, please accept my comments on the CalPortland South Parcel Mine Expansion as a part of the record. I have written these comments as a citizen and not as a member of the City Council. I have lived here since 1996 and was friends with Judy Krill, who first sued CalPortland (Lone Star then) in 1994 over the expansion of the gravel mine. When the 1994 agreement was signed, it stated on Page 22, "WRECO and Lone Star agree to seek no permits in the future to mine in a manner that would significantly impact the flow of Sequalitchew Creek". We all felt relieved until 2009 when CalPortland wanted to expand again. Another agreement, the 2011 Settlement Agreement was signed, and after several years of mediation, the Sequalitchew Creek Restoration Plan was added. The small non-profit groups have been fighting CalPortland for years. As the volunteers age, their funds dry up, they can no longer continue the fight. It is very difficult to fight a billion dollar corporation. It is time for our city to take a firm stance and say no to the expansion to protect our environment, unless they want to mine above the aquifer. That is the only acceptable mitigation. Below are my reasons.

Comments Opposing the CalPortland South Parcel Mine Expansion DEIS

Having read the Critical Areas Ordinance and the 2015 Comprehensive Plan, I cannot imagine how the proposed South Parcel Mine Expansion can proceed. Below, I have outlined the pertinent parts of the CAO and the 2015 Comprehensive Plan that address why this proposal should be avoided or minimized to reduce the adverse impacts as

stated in our CAO to protect the public health, safety and welfare of the citizens of DuPont.

DMC Chapter 25.105 Critical Areas

The primary purposes of this chapter are "…to protect the public health, safety and welfare by preventing the adverse environmental impacts of development."

DMC 25.105.010: Directing a policy of no net loss of wetland and stream function, Value, and area within the city.

DMC 25.105.010: Preventing, to the extent practicable, adverse cumulative impacts to water quality, wetlands, stream corridors, and fish and wildlife habitats using best available science.

1 City EA DS

DMC 25.105.010: Encouraging improvements to, and good stewardship of, surface water bodies and watercourses;

DMC 25.105.010: Encouraging improvements to, and good stewardship of, surface water bodies and watercourses;

DMC 25.105.010: Protecting the public from injury, loss of life, property damage or financial loss due to flooding, erosion, landslides, seismic events, soil subsidence or steep slope failures;

2015 Comprehensive Plan

Resource Land Goal LU-10: Recognizes the value of mineral resource extraction while protecting the natural environment's integrity.

2 City EA DS

LU-10.3 Ensure mining activities employ best management practices that protect the long term integrity of the natural environment, water resources, adjacent land uses, and the long term productivity of the resource lands.

Natural Environment Goal NE-1: Protect DuPont's natural environment by meeting the needs of today's citizens without compromising the needs of future generations.

- **NE 1.1** Preserve environmentally sensitive areas and those that are valuable natural and aesthetic resources to the City
- **NE 1.2** Institute and regularly update measures which promote development and construction practices that minimize impacts on the environment
- **NE 1.4** Work with JBLM, The Department of Ecology, Glacier NW, environmental groups, and other affected parties to restore and improve the flow of water through Sequalitchew Creek.

2 cont.

Natural Environment Goal NE-5: Restore historic stream flow, improve habitat conditions, and promote long term preservation efforts within the City.

- **NE 5.1** Maintain and where possible restore and enhance ecological functions and values of the Sequalitchew Creek Watershed, lakes, marshes, streams, wetlands, bluffs, and recognize the potential for passive public access on or at Old Fort Lake

- **NE 5.3**. Maintain important wildlife habitats and function wildlife corridors to link important natural areas such as Edmond Marsh and Sequalitchew Creek.

- **NE.5.5.** Recognize that the Oak Savannah is a unique habitat within the City and region and preserve the highest value oak groupings in the area as open space.

2 cont.

CalPortland's South Parcel proposal has elements, which I have discussed below, that contradict our 2015 Comprehensive Plan and our Critical Areas Ordinance.

GROUNDWATER/AQUIFER

Impact of the South Parcel mine expansion on the Vashon Aquifer and Sequalitchew Creek

The expansion plans are to dewater the Vashon Aquifer, which will severely impact the Sequalitchew Creek Ravine. According to the proposal (page 3.1-14), the seeps and springs that sustain the creek year-round will be drastically reduced or eliminated. The potential consequences of this dewatering are dire:

- **Drying up of vegetation:** The lush vegetation that thrives in wet conditions may struggle or die off. Plants adapted to moisture may wilt, lose leaves, or become dormant.
- **Soil erosion:** Without the binding effect of wet soil, erosion becomes a concern. Rainwater can wash away loose soil particles, leading to gullies and landslides.
- **Cracking and compaction:** As the soil dries, it contracts and cracks, reducing its stability and making it less suitable for supporting plants or structures.
- **Loss of habitat:** Animals and insects that rely on the wet environment may move elsewhere or face challenges finding food and shelter.

3 DS EA

- **Temperature changes in the creek:** The loss of cool groundwater and the drying up of vegetation will lead to significant temperature changes in the creek, affecting aquatic life.
- **Decreased biodiversity:** The impact on groundwater will lead to decreased biodiversity in the ravine.
- **Drying up of the tree canopy:** The extensive tree canopy, which provides shade, cooler temperatures, and habitat for wildlife, will dry up, altering the landscape dramatically.

3 cont.

No mitigation measures in the proposal effectively address the loss of the Vashon Aquifer seeps, leading to the irreversible degradation of the Sequalitchew Creek watershed.

The Sequalitchew Creek Restoration Plan could work without dewatering the Vashon Aquifer. It would be a better plan for the environment and for future generations if groundwater was flowing through the wetlands and creek, along with the water diverted from Sequalitchew Lake.

4 City DS EA

CalPortland could be a good community partner by funding the restoration plan without dewatering the aquifer.

The Sequalitchew Creek ravine lies within a landslide hazard area according to the DMC. The DEIS asserts on page 3.1-14 that "The seeps and springs identified on Figure 3.1-3 are expected to be reduced or dewatered in their entirety, which may reduce the level of landslide hazard susceptibility within the ravine." This assertion

5 EA DS

seems contradictory to the groundwater dynamics associated with dewatering a lush slope in a riparian corridor, which typically leads to instability and potential landslides.

5 cont.

Scientific research on groundwater dynamics demonstrates that when a naturally wet and lush steep hillside dries up, significant changes occur due to the lack of moisture:

- **Vegetation Stress:** Plants accustomed to moist conditions may struggle, wilt, lose leaves, or become dormant.
- **Soil Erosion:** Without the cohesive effect of moist soil, erosion becomes a concern as rainwater washes away loose soil particles, potentially causing gullies and landslides.
- **Cracking and Compaction:** Drying soil contracts and cracks, reducing stability and suitability for supporting plants and structures.

6 EA Cal DS

This understanding of ground hydrology contradicts the DEIS statement on page 3.1-17, paragraph 2, which suggests that mining could decrease seeps and springs in the Sequalitchew Creek ravine, potentially improving slope stability.

Impact of the South Parcel mine expansion on the Wetlands

The proposal also threatens five wetlands, one will be eliminated, and four others will experience significant water level reductions. Proposed mitigation measures, such as redirecting surface water from Sequalitchew Lake, are insufficient and only partially available for about six or seven months of the year. During dry months, wetlands will remain low or dry up, exacerbating the impact on shallow wetlands dependent on the Vashon Aquifer and rainwater.

7 EA DS

I struggle to understand how depleting the Vashon Aquifer, which will permanently lower the water level in West Edmond Marsh by 9 feet and reduce the water table in four other wetlands by 1 to 2 feet, especially when they already dry out in summer, along with the elimination of one wetland and the drying up of seeps that sustain Sequalitchew Creek year-round, can be considered responsible stewardship of our surface water bodies and watercourses. This proposal will cause irreversible damage to our wetlands and stream, impacting both the quantity and quality of water available to wildlife, fish, and other species, while also diminishing the quality of life for humans.

8 DS EA City

The proposed mitigation, which suggests diverting surface water from the diversion canal through Edmond Marsh and down the creek for perhaps six months of the year, contingent on sufficient water availability from JBLM, falls short of promoting good stewardship of our surface water bodies and watercourses.

Environmental and Climatic Concerns

Since the 2011 Settlement Agreement, climate conditions have worsened, with longer dry periods, hotter temperatures, and increased aridity. From 2011-2023, temperatures in the Seattle area have risen by 1.06°F, and precipitation has decreased by 9.9% according to data from the University of Washington Climate Impacts Group: https://climate.washington.edu/climate-data/trendanalysisapp/. The proposed dewatering will exacerbate these issues, leading to dire environmental consequences for DuPont now and in the future.

9 EA Cal DS City

Moreover, the DEIS fails to address the potential fire hazards that could result from the Sequalitchew Creek Ravine becoming a dry tinderbox. With increasing temperatures

10 EA Cal DS

and reduced rainfall, the risk of wildfires is significantly heightened. Dry vegetation and lack of moisture will create ideal conditions for fires to ignite and spread, posing a severe threat to the local ecosystem and public safety.

10 cont.

PLANTS AND ANIMALS

The dewatering of the Vashon Aquifer will have severe consequences on the environment within a two-mile radius of the mine site. The wetlands affected by this dewatering are surrounded by large trees, including Western Red Cedars, Garry Oaks, Douglas Firs, Madronas, and other essential trees and shrubs. The plants and trees provide critical habitat for wildlife, offer shade, and help purify the air. If the water supporting these trees and shrubs is removed by the dewatering, the effects will be devastating. The landscape will transform from one with towering trees that provide shade, a cooler climate, and habitats for wildlife to a dry, barren area due to the lack of groundwater.

11 EA Cal

The proposal clearly states the impacts on groundwater levels:

- West Edmonds Marsh groundwater level will decrease by 9 feet.
- Pond Lake water level will be reduced by 2 feet.
- Wetlands 8, 9, and 10 will see a reduction of 1 foot in water level.
- Old Fort Lake water level will be reduced by 0.05 feet.
- The Kettle Wetland will be eliminated.
- The seeps and springs that feed Sequalitchew Creek will dry up.

12 EA Cal

These reductions in groundwater levels will be permanent.

In addition, the project will eliminate a 146-acre forest. Trees in this forest play a crucial role in removing carbon, lowering air temperatures, absorbing sound, providing critical habitats for birds and animals, and improving air quality. This forest is needed for the reasons stated above, as our climate becomes increasingly hot. The forest includes approximately 81 Douglas Firs, 17 Garry Oaks (a protected species in DuPont), and 10 Western Red Cedars, among others. If the mine is expanded all of these trees will be eliminated.

13 EA

The cumulative impacts of this project on our land, water, air, trees, birds, and animals are profound and permanent. There is no mitigation that can counteract these devastating and long-term effects.

14 EA Cal

In conclusion, the environmental assessments outlined in the DEIS present conflicting assertions regarding the impacts of dewatering the Vashon Aquifer on the Sequalitchew Creek ravine. While the DEIS suggests a potential reduction in landslide hazard susceptibility, scientific understanding of groundwater dynamics indicates that such actions could destabilize the steep, lush slopes of the ravine, leading to increased risks of erosion and landslides. Moreover, the DEIS overlooks the significant fire hazards that may arise if the ravine becomes dry and susceptible to ignition.

15 EA Cal

Given these critical environmental concerns and the principles outlined in DMC 25.105.020, which advocate for prioritizing avoidance and reduction of adverse impacts on critical areas, as well as our Comprehensive Plan, I strongly urge the denial of the permit for mining the South Parcel. The proposed mitigation measures, including the Sequalitchew Creek Restoration Plan, do not adequately address the irreversible harm

16 EA City

that would negatively impact our wetlands, streams, and overall ecosystem integrity. The only mitigation that would be acceptable is to mine above the aquifer. This will not save the forest, but it will save the water in our wetlands, stream and ravine.

Our community's 2015 Comprehensive Plan underscores the importance of safeguarding our natural environment for present and future generations. How is dewatering of the Vashon Aquifer, with all the detrimental impacts in perpetuity, protecting the natural environment's integrity, as stated in LU Goal 10? 16 cont.

To uphold these commitments and protect our critical resources, I respectfully request that the permit to mine the South Parcel be denied. Let us prioritize sustainable development practices that align with our environmental values and ensure the preservation of DuPont's natural heritage.

Beth Elliott

Letter 72

Attn: Barb Kincaid

CITY OF DUPONT

7/21/2024

As of today, Sequalitchew Creek from its Source down to Puget Sound, is likely further from being restored to historic flow levels than ever before...and certainly worse off than 20 years ago when I began to be involved after fortuitously encountering the confluence when boating on Puget Sound. (back then there were fences and gates at the top and bottom restricting access to the canyon) Over my years of grass roots community advocacy for the preservation and betterment of the natural wonders within our city, Sequalitchew creek and its canyon, the Puget sound shoreline and bluffs, and Old Fort Lake have always been the Jewels in DuPont's crown!

1 DS Cal

These areas have been so degraded by the process of human determinations of non-significance and mitigations done elsewhere to allow negative actions where it really mattered, its no wonder that the fish don't return, the trees die and fall over, and the invasives inhabit. When will it stop? When will restoration of a natural feature be done to undo what has been previously compromised over, in order to move it back toward what it formerly was, what it could be, what it should be, not as a means to an end. I resent the carrot and stick methodology that the applicant Pioneer Aggregates/Glacier Northwest/CalPortland has followed in order to hold any beneficial action within the watershed hostage until such time as it can be used as a bargaining chip to withdraw more gravel. WITHOUT THE AQUIFER SEQUALITCHEW DIES FOREVER.

2 DS

I actually think Mining should be allowed to the maximum extent **in so far as it has no impacts <u>outside of the property boundary</u>.** To think... that I, a citizen property owner, would have the audacity and ability to take an action that would affect my neighbors property adversely, basically without their consent is preposterous. I do not consent to dewatering below my properties here in DuPont, and as a resident I object to dewatering under publicly owned city property which is held for the benefit of all flora and fauna, and those who live and visit here. Sequalitchew creek and associated wetlands being dewatered anywhere in the basin is unacceptable, and flows in the canyon being reduced by 79% more than the current meager flows is ludicrous. WITHOUT THE AQUIFER SEQUALITCHEW DIES FOREVER

3 DS

I sat on the Restoration Planning committee as the Chair of the Sequalitchew Creek Watershed Council, along with the NDA, Mining Consultants, SPCSEG and the Tribe. After almost a year of discussions, deliberations and feedback, when it came time to vote, our organization voted **against** the plan. Primarily because the restoration plan didn't go far enough to 1. **restore historic flows**, advocated exchanging 2. **warmer surface water in place of cooler aquifer water** within the creek and marsh flows, didn't address the 3. **beaver management solution long term**, and also failed to have 4. **community opportunities to participate**. This updated proposal hasn't changed much.

4 DS

1. It doesn't get back to historic flows, and grossly underestimates the CFM gains which could be made up if the cork isn't popped on the Aquifer.

2. No fish expert would ever advocate for warmer turbid surface water over colder, cleaner, subsurface water, which is what target species need to return.

3. Old time residents of DuPont will share stories of large salmonoid fish in Edmonds marsh as late as 1997-2000. What has changed since there was last fish here? **No active beaver management strategy** either on DuPont land or Ft. Lewis, and the **installation of center drive, and bulldozing away of topsoils up to the wooden bridge**. These actions and inactions allowed at least 3 distinct beaver family groups to

raise the water level of the marshes while building at least 9 large dams, killing the surrounding trees, and causing the water to mostly flow backward. And at the west end of Edmond marsh the creek went sub surface past Center drive and disconnected the canyon from the marsh on the surface. While the construction diagrams of the bridges, stream rebuilding and construction work is impressive cherries on top... the whole plan hinges on ACTIVE 24/7/365 beaver management. Those pond levelers will quickly be blocked up, the beaver will adapt and things will revert to how they are now. I am a WCO for Washington State Dept of Fish and Wildlife with 10 years experience, I've been in plenty of watersheds dealing with beavers, and it takes constant, pro-active management strategies in order to keep the water flowing. This plan while "adaptive" doesn't have the guts to do what needs to be done to make progress.

4 cont

4. Since Mayor Jenkins and Administrator McDonald any meaningful grass roots efforts have been tied up under threat of lawsuit or in the "process" or revised Settlement Agreement, relegated instead to the paid "experts" and the minimum effort necessary to secure access to the gravel. Lets not be fooled, this whole process is **not a restoration plan for Sequalitchew**...it's **a Mining plan that needs to deal with a dewatering issue**. The original Settlement Agreement had language that the applicant wouldn't seek to mine deeper, but before the ink had dried there were monitoring wells being placed on public property, property lines being drawn to access the middle of the creek where the water could be dumped either thru "micro-tunnels" or previously in a northern tributary, and political climate being tested to accommodate a revision.

5 City Cal DS

Human induced dewatering of an Aquifer is never a good idea. Google searches reveal that it's a similar threat as Climate Change. How a 6 month test regimen could be expected to accurately determine these localized changes without seeing each of the 4 seasons is unlikely. Subsequent mining would likely take decades where the aquifer would be depressed, a wholesale collapse of the vegetation is likely at the seeps. I've seen the localized dewatering effort which took place as part of the Amazon building access road off of Bronson St. They had pumps going in order to get the sewer and water lines onto the property in the dry, while they pumped the water table down and infiltrated the water elsewhere. That was a lot of water and the volume which will need to be pumped by 60 wells would likely fill 200 Olympic size swimming pools every 24 hours. That is a huge amount of water which will dry out marches, kills vegetation when the roots go dry, likely contribute to Land Subsidence, leave massive groundwater and surface water infiltration issues for the city to deal with after the gravel is gone...forever. The wetted hillside instability will never be compatible with the planned Sequalitchew village housing area, that tax base will be lost forever. Land subsidence is a real possibility, my properties would be affected and they would be responsible for impacts throughout the affected housing areas and also warehouses around the area exhibiting visible cracks on the massive slab on grade floors.

6 DS Cal

I have lived, worked and played in DuPont for 23 years, served on City Council, Parks Agency, and as the Chair to the Sequalitchew Creek Watershed Council, been mentored by signatories of the original settlement agreement, attended countless days and hours of gatherings, meetings, briefings, community awareness functions, poured over boxes and boxes of documents, questioned processes, been through Edmonds marsh by canoe, hip-waders, provided firsthand information to consultants for the applicant, walked on trails, and bushwacked everywhere else I could, walked on beaver dams, done restoration projects up and down Sequalitchew canyon and attempted to bring about other projects of benefit.

7 EA

To those considering this plan for approval, go ahead and allow mining on the leased and owned property, **but there should be no impacts outside of the mining boundaries**, its not our fault there is an Aquifer in the way! Once the aquifer is breached it can't be put back, any "restoration" work isn't restoring, its mitigating, it doesn't make it better where it matters, which is groundwater, it just adds surface water and takes the groundwater...not a viable exchange for the restoration plan. Once it happens there is no putting it back, **it's going to weep like a giant wound on the landscape**. What is proposed cannot be reversed and the effects will be long lasting and permanent. No good can come from it, except a monetary benefit to the mining company. Long term... **citizens will be stuck with a huge unstable, unusable weeping wall and permanent water infiltration issues in the bottom of the hole, and WITHOUT THE AQUIFER SEQUALITCHEW DIES FOREVER.**

RECEIVED
JUL 22 2024
CITY OF DUPONT

July 22, 2024

Barb Kincaid
The City of DuPont
1700 Civic Dr
DuPont, WA 98327

Dear Ms. Kincaid,

I am very concerned that the proposed expansion of the CalPortland mine will severely and negatively affect the city of DuPont and its residents.

The environmental repercussions of the expansion are worrying. I hate to think of additional loss of forest habitat and removal of landmark trees. Forests are of high importance with regard to managing greenhouse gasses. The four-part dewatering plan is frightening, and I cannot imagine that the Sequalitchew Creek and Edmonds Marsh would ever be able to recover, despite the proposed "careful monitoring" of each dewatering and mining step. 1 EA

This community thrives because our access to natural beauty is preserved. The trail system in DuPont and the beloved Sequalitchew Creek trail are gems that I did not know about when I bought a home in DuPont, but I have come to champion these things as part of what makes DuPont so special and unlike surrounding areas. When I attended the CalPortland open house in August 2023, I was very pleased to learn about the Sequalitchew Restoration Project that was being funded by them, and I was excited by the promise of what a restored creek could bring to the area.. I now see that implementing this restoration project seems to be in jeopardy if the south parcel is mined as proposed. 2 DS EA

I plead with the city not to approve the expanded mine proposal. I realize that restricting the mine will have financial repercussions for the city, but I would gladly take on additional homeowner taxes in exchange for retention of our surrounding natural landscape. 3 EA

Sincerely,

Anna Marie Etzkorn

If you have concerns regarding the EARTH, please describe them below.

I have concerns that with the increase of fire and hotter temperatures that reducing the water to our vegetation and removing the Gary Oaks (adult trees have fire-resistant bark) will increase the likelihood of a fire that will affect all of DuPont.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

With the loss of vegetation from the loss of stream flows it will decrease the pollutants able to be removed from the ground and air.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Dewatering the aquifer is against DuPont Municipal Code 25.105.050 which spells out the many benefits that the aquifers have on our area to include the reduction of pollution. Decreasing or removing this water forever is not in the best interest of anyone.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Code 25.105.050 of the DMC specifically spells out the importance of our aquifers and streams and the importance of them. Allowing this expansion will do damage to DuPont ok many different levels and will be permanent.

3 DS City EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Many species of fish, plants, and animals will be affected by the loss of the wetlands, streams, and aquifer. Including several species of endangered animals and plants to include the Gary Oaks and Western Gray Squirrel. The gray squirrel depends on tHe Gary Oaks for their habitat but the mature Gary Oaks also provide fire protection. It would serve us all to not only protect these trees but also to propagate more for further protection from fire in the future.

4 EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

Please consider that allowing the dewatering of the aquifer will have long lasting and permanent negative affects on our water, nature, and safety from heat and fire. It may also affect our property values and increase pollution.

5
DS

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.
Air quality will be degraded due to the loss of the wetlands in this area impacting all citizens in Dupont.

1 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
This ground water cannot be replaced and will impact the community, at some point we might need this ground water for drinking.

2 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
streams will cease in this area, and the vegetation will die resulting in the increase of wildfires damaging homes and maybe life's.

3 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
Fish/plants and animals will be impacted.

4 EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.
This needs to also be studied.

5 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

Overall, I oppose the mine dewatering the aquafer. It is time to say no to anyone and big business. This will impact the quality of life to our town, it will see an excodus of people from the town, and will devalue our homes. No to this expansion of the mine, I am okay with them leaving time to say No.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

What is the name of the Agency or Organization?

Parks and Rec Commission

If you have concerns regarding the EARTH, please describe them below.

I'm always concerned about the Earth and try to do my best to mitigate problems associated with pollution etc. I admin a FB page DuPont Serving the Community where I try to encourage fellow residents to be good stewards of the only Earth we have. This should be everybody's concern

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Absolutely, I like to breath! Fortunately in DuPont enjoys fairly decent air quality. Problems from smoke generated from wild fires and fire pits do affect the air quality. So does Industry.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Absolutely. Not just for humans but for Wildlife. I've read expanding the mining operation would drain the Vashon Aquifer and the Sequalitchew Creek. This would be devastating to our local ecology. Not long ago I ran into people testing the waters with the purpose of salmon swimming again in the creek. The creek should be allowed to flow freely like it used to before they dammed diked and diverted it. I AM AGAINST THE MINE EXPANSION.

3 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Absolutely. We need safe drinking water. The city is taking steps to remove PCAS from the water. We don't need mines, industry polluting out drinking water.

4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Absolutely. We're fighting a losing battle to save the Orca and other birds and mammals in the Puget Sound area. We don't need mines taking away the water needed for our wildlife

5 EA

If you have concerns regarding NOISE, please describe them below.

All the time, love DuPont where we can sit outside to the quiet and peace we enjoy. Leaving windows open while we sleep. We do have noise from JBLM but only at certain times plus it's essential to national defense. I am an Air Force veteran and used to the sounds of the military.

6 EA

If you have concerns regarding LAND USE, please describe them below.

Yes, single family housing only with possible retail space should be built. No warehouses, light or heavy industry facilities. No low income multifamily dwelling's. Keep DuPont the pleasing aesthetic and safe place to live.

7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

Absolutely DuPont is a beautiful small town. This is the reason I bought a house here and made it my forever home. We should do our best to maintain it that way. No MINES.

8 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

Of course we should cognizant to cultural resources. Particularly the local tribes who lived here way before we turned up. We should restrict metal detecting to authorized personnel who are not going to profit or destroy cultural resources.

9 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

I would like to train and bus services more often from DuPont. I'm a senior and hate the drive to Seattle. Can't go on a weekend, no public transport. There is a concern of the riff raff this may bring though.

10 EA

If you have OTHER concerns not listed above, please describe them below.

No MINE expansion. No Warehouses, No Light/Heavy Industry. Help preserve DuPont as the utopia I feel it is.

11 EA

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

I strongly oppose CalPortland's request to drain the aquifer to mine gravel. Water is life, the consequences of such an extreme action are difficult to predict. Therefore, a conservative approach is warranted, to ensure the citizens of DuPont have an accessible and reliable water source now and in the future. Additionally, the effects of the mining will have a huge impact on the quality of life of those who reside in the immediate vicinity of the mining activity: increase in noise, loss of forest canopy, loss of wild animal habitat. These are some of the special attractions to living in DuPont, once they are gone we become just another city in the state of Washington.

1 EA

If you have concerns regarding the EARTH, please describe them below.

Global warming! The earth needs more protection (trees), not less.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Trees are also important for our air quality. If we keep removing them, we are directly impacting the air quality for all people and critters in Dupont.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Draining the aquifer directly impacts water available to our citizens. With summers getting hotter, even more water will be needed in the future, especially with the addition of more housing and business around the golf course.

3 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

All of our earth water systems are interconnected and co-dependent. We can't possibly know the full, future impact this project will have on our quality of living.

4 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Again, people (and domestic and wildlife) are all impacted by rising temperatures, air quality and water quality & availability.

5 EA

If you have concerns regarding NOISE, please describe them below.

Noise from the machinery will directly and negatively impact those living nearer to that area (including wildlife). And, just like the Interstate, even those not close will be effected depending on the wind.

6 EA

If you have concerns regarding LAND USE, please describe them below.

There is no benefit to any people, plants or animals from degrading the land. Draining the aquifer, drilling/blasting the countryside will do nothing but disrupt our beautiful, quiet town.

7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

For those who like to walk the trails &/or go off trail, the beauty of nature will be spoiled.

8
EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

Just an FYSA. I convinced my husband to move to Dupont when he retired because I loved the small town feel, natural beauty and peacefulness. The more we develop, build, destroy and negatively impact this city, the more I regret that decision.

9
EA

What is the name of the Agency or Organization?

If you have concerns regarding the EARTH, please describe them below.
Dewatering may cause additional ground settling in previously developed areas. This could impact the foundations for buildings in the industrial park and the liner for Landfill 5. Additional discussion is warranted regarding impacts to the industrial park and Landfill 5.

1 Cal EA

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
Dewatering will cause potentially contaminated water from under Landfill 5 to migrate toward the mine site. More consideration needs to be given to the impacts to Landfill 5.

2 Cal DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

My concern regarding the wetlands is that with the water table dropping especially during the driest time of the year it will lead to significant amounts of vegetation will dying. This will not just impacting the plants, animals, general beauty/enjoyment of the area to include trails but also significantly increase fire risk to the entire town. This not only makes the area less desirable but could be devastating to property value along with increasing fire risk to the area.

1 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

Decreasing vegetation to our area/trails will make part of what makes DuPont so enjoyable a much less desirable place to live/visit.

2 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

The beauty of the Sequalichew creek area has been one of my favorite places in DuPont and surrounding areas for the last 10 years. Further mining uphill from this gem will ruin the area in so many ways. The serene noise of the creek running between the hills will be drowned out by industrial noise. The hillsides covered with greenery and beautiful trees could dry up and ruin even the structure of the hillsides.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding NOISE, please describe them below.

The creek should be the only thing heard as you walk down the trail that could be a top trail in all of the Puget Sound.

2 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding the EARTH, please describe them below.

EPA studies on leaching through deeper mining?

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Only as fire risk rating will increase with loss of freshwater city source and likely stressed vegetation.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Very strong concerns on aquifer drainage, including resultant brackish infiltration and subsequent impacts on water availability for a growing community. There are secondary concerns on the downward watershed areas. Doing so may truly eliminate any freshwater sources for the city. What were the hydrology study predictions? What were the models used for these predictions? Was DuPont city leadership made aware of these concerns? If so, What was their risk calculation and anticipated mitigation strategy? Strongly recommend involving USGS and UW professors with research in this area before you make an irreversible and catastrophic decision.

Please make public and easily accessible Who did the environmental studies, and what were their credentials? Interested and supporting parties and constituents? Timeframe projected for modelling.

3 DS City EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Similar comments to above, but generally less impactful. This will likely be noticed earlier by public before DuPont ceases to have reliable water service from above. There is a real risk of decreased downstream trickle secondary to opened capacity for aquifer to refill and subsequent vegetative stress. As this may impact the local trails, consider lost revenue to housing when community attractiveness standards decline. The green trails are a selling point to newcomers,.

4 DS EA

Regardless, recommend discussion with Nisqually nation due to their historic origins to this area.

5 EA City

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Related to above, salt water infiltration will impact bordering biomes once aquifer is drained.

6 DS EA

If you have concerns regarding NOISE, please describe them below.

None.

If you have concerns regarding LAND USE, please describe them below.

I'm not as related above.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

As above. Is more an economics issue per se. Housing values will drop with stressed vegetation and loss of aesthetic attractions.

7
EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

Sequalitchew trail as mentioned above.

8
EA

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Accessing the aquifer to expand the gravel mine is not a good idea. Lowering the water table, and the access to potable water during the hottest months of the year could cause devastating effects down tbe road.

1 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Reducing the wetlands and streams by accessing the Vashon Aquifer will result in a domino effect and losing green areas, increasing temps, higher cooling and heating costs, and less wildlife.

2 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

I urge the city to oppose dewatering the aquifer for the sole immediate financial interest of a business vs. the long term quality of life for the citizens and visitors to DuPont. Additionally we have an obligation to protect the area for the indigenous wildlife that depends on it. This self serving request is unconscionable and should be decisively rejected!

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

I have concerns that this company will deplete groundwater solely to make a profit at both the short term and long term expenses of our community. This action will not make DuPont a better place to live and the company is the only one to benefit. Please do not approve this request.

If you have concerns regarding the EARTH, please describe them below.
All of the concerns I list below regrard the EARTH.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.
The loss of vegetation from the dewatering of the Vashon Aquifer and subsequent impacts to the Sequalitchew Creek will not only increase the fire risk and the impact to air quality from fires but also lessen the vegetation in the area that aids in keeping good air quality.

2 DS EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
The Vashon Aquifer is an important water resource for Dupont, has been used in the past and could be needed in the future for our growing city population. Dewatering this resource for a company to make a profit is a terrible idea.

3 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
Losing wetlands, creeks and marshes is detrimental to the aquatic species, land animals and plants in the area. Many places are concentrating on bringing back wetlands, streams and marshes, not destroying them.

4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
Loss of water resources will be detrimental to the fish/plants and animals in the area. This loss of water resource could potentially drive the wildlife further into habited areas and cause more conflict and loss of species in the area.

5 EA

If you have concerns regarding NOISE, please describe them below.
Gravel mining is not a quiet business.

6 EA

If you have concerns regarding LAND USE, please describe them below.
This land once destroyed will never be the same

7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

See above

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

Truck traffic is already a problem. If this adds more then that is a concern.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

We often walk the Sequalitchew trail. The environmental impact of an expanded gravel pit mining would be devastating to everyone who frequents there and not to mention the creatures who call it home. It is time we stand up to big business and say no we need our green spaces. The science that proves that these healthy green spaces are essential to human health and wellbeing are well documented and need to be taken into consideration. We are losing precious greenspace daily and we need to stop.

If you have concerns regarding the EARTH, please describe them below.

I just saw that a forum about a gravel mine expanding and causing the Squalitchew creek trail to dry up and harm the beautiful nature. My family. including 2 young kids, use this trail almost every week. The vegetation and atmosphere of the trail are the best parts and if those die off, that trail will be devastating to walk.

If you have concerns regarding the EARTH, please describe them below.

As a community having trees and sufficient water for all is what DuPont been striving to keep. We are a proud community to cut trees and take water from our neighbors would be a mistake. This would cause the neighborhood to become hotter in the summer months. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

By cutting down trees Air Quality would be a tragedy. The people of the community may suffer more allergies and asthma attacks. I myself have both but good air quality helps tamper my symptom's down. 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

As we all know water is a precious why would any community want to give it up as the earth heats up we should think that our ground water helps to keep the area cool. Water is essential to life. 3 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

The streams and wetland are not only beautiful to humans but is essential for the wildlife the lives in and around Dupont. 4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If we take water and surface streams and wetlands from the wildlife here in DuPont we just become another unsustainable neighborhood. Most of us who live here enjoy seeing squirrels, chipmunks, deers and others. Don't take this beauty away from generations to come because of greed. 5 EA

If you have concerns regarding NOISE, please describe them below.

The only noise I have is human made noise loud cars and the noise from I-5 6 EA

If you have concerns regarding LAND USE, please describe them below.

My concern is how many more warehouse. I moved here to live in peace in a neighborhood that was surrounded with trees and be able to go on walks and ride my bike. Now as I go on my walks I see more trucks that are taking over our roads. 7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

Continue to keep our neighborhood clean and maintained which it is being done.

8 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

I don't have any

If you have concerns regarding TRANSPORTATION, please describe them below.

I don't have any

If you have OTHER concerns not listed above, please describe them below.

Please keep our community with its natural beauty keep our trees, natural waters don't let greed take and destroy our neighborhood. It would be a tragedy if we let someone come into our community and take away resources from us.

9 EA

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Dear Director Kincaid,

I am extremely concerned about the proposed CalPortland South Parcel mine expansion and its impact on the groundwater level due to dewatering the Vashon Aquifer. This could significantly affect surrounding vegetation and increase fire danger for our residents, homes, and businesses. It would dry up the seeps along the Sequalitchew Creek Trail, causing the hillside slopes to dry up. I walk this trail with my dogs every week. I love to hear the babbling of the Sequalitchew Creek alongside the trail. If the South Parcel mine expansion receives a permit the creek water alongside the trail would go dry for almost half of the year. Currently, the underground water from the Vashon Aquifer feeds the lush hillside as well as the creek and our wetlands. Please DO NOT approve a mining permit that will destroy our stream, our hillside, and our wetlands IN PERPETUITY. No mitigations exist, nor is any mitigation proposed, that would protect our environment. 1 DS

The projected drop in the groundwater level of up to 9 feet in Edmonds Marsh is of specific concern. Other areas of concern include the drop in groundwater level in Pond Lake, wetlands 8, 9, and 10, and Old Fort Lake. Additionally, the elimination of the Kettle Wetland and the drying up of seeps and springs feeding Sequalitchew Creek are troubling. This drop in groundwater level will likely dry out the vegetation surrounding the City of DuPont. 2 DS EA

Climate conditions have worsened since the 2011 Settlement Agreement was prepared. The City of DuPont is surrounded by forests, and climate change is already increasing the risk of fire to our residents. The resulting decrease in the groundwater level from the mine expansion will likely put DuPont residents at an even greater risk of fire danger. 3 DS City

Restoring Sequalitchew Creek does not have to depend on dewatering the Vashon Aquifer. It should be restored without dewatering the Vashon Aquifer. In fact, CalPortland could be a great community partner by funding the restoration WITHOUT dewatering the aquifer. As outlined above, the decrease in groundwater level throughout the area will likely have a significant negative environmental impact on our wetlands, vegetation, and wildlife. 4 DS City

Thank you!

Concerned Citizen

If you have concerns regarding the EARTH, please describe them below.

Pretty concerned that the mining request to use water from the Vashan Aquifer is even being considered. It's noted that it will dry out that area during the summer months is unacceptable. That the only time it doesn't consistently rain here and they'd be using all of the water the vegetation needs to survive.

1 DS EA

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

I thought the City of DuPont protected the natural habitats of wildlife as much as possible. So I'm hoping they do not allow the mining request that would allow them to tap into the Vashan Aquifer. That would not align with what I've come to see as the values of the City of DuPont.

If you have concerns regarding the EARTH, please describe them below.

Gravel mines leave the earth in a devastated condition. Once the company is gone citizens will be left with the aftermath.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

This is of the upmost importance to this community now and in the future. The time for caring for our water sources is upon us. The leaders of our city need to think in terms of sustaining natural sources not using them up. The idea of dewatering flies in the face of every bit of science we are dealing with currently. Please act accordingly and turn this proposal down. Thank you.

2 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

The Sequalitchew Creek is a diamond in our community. We should always act to care for it as such.

3 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
This plan for graveling will dewater the aquifer causing severe damage to wild life. Endangering the natural ecosystem by drying up the aquifer for. GeVsl extraction projection threatens the health and stability of our land. This will lead to loss of life and species first and foremost, and then second hand will cause damage to soil health through drying up the ground. This will lead to less stable roots in the ground, less wild life roaming and fertilizing the soil, and ultimately leads to a higher risk of landslides, wild fires, and more polluted waters.

1 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
Drying up the aquifer is damaging to the wetlands which remains an important participant in a healthy eco system!

2 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
This project will most definitely disrupt all of the above

3 EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.
Absolutely no one wants to walk down our neighborhood trail that is linked to so much culture and history, and see a literal gravel mine and heavy machinery

4 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

This area is extremely sensitive and has deep cultural roots and much history. This is the little space left that hasn't been developed and destroyed already. It should remain off limits. We have taken enough from this space

5
EA

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

I just don't think this project is necessary. Which I know doesn't go far when so much money or demand is at play. There must be another way to source gravel without blatantly disrespecting the little space we have saved from our destruction. The sequalitchew creek trail should remain an untouchable place besides trail maintaince and things that are good for the ecosystem here. I don't believe that's 'too much' as we have largely developed the city. Green spaces are essential for our wellbeing. drying up the aquifer is not worth it. It's so important for filtering out all the pollutants being washed down from the city into the sound. Keep our waters clean

If you have concerns regarding the EARTH, please describe them below.

Climate change is a viable concern and water resources are becoming increasingly more valuable. Any operation that would seek to reduce or eliminate a freshwater resource for corporate profit with little to no meaningful return to the citizens of the community involved should be rejected.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Without adequate water resources to keep the vegetation in the community thriving, the risk of fire goes up and fire is a leading cause of upper respiratory inflammation. The additional truck traffic and heavy equipment operations from an expanded mining operation further releases pollutants and deteriorates air quality for the immediate vicinity around the site.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

The aquifer provides needed water resources to our natural habitats throughout the community, but especially to the Sequalitchew trail area and Edmonds Marsh. These areas would suffer greatly from dewatering the aquifer. Further, if plans to develop Old Fort Lake come to fruition, the Vashon Aquifer resources may be needed to bolster the cities supply of freshwater to meet the demands of the additional residents and businesses for that project.

3 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

The protection of the vegetation and wildlife along the Sequalitchew Trail and Edmonds Marsh has must be a serious consideration before approving the mine expansion and, in my opinion based in the review of the public documents regarding this project, the ends to implement this project do not justify the means. Destruction of the natural areas that make DuPont such a desirable place to live should not be allowed under any circumstances but especially not to increase the interests of private business.

4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

See the above comment regarding destruction of natural habitat for corporate profit.

If you have concerns regarding NOISE, please describe them below.

At the best of times, the audible noise from the existing mining operation is a nuisance. Expanding these operations reduces the quality of life for residents of our beautiful town, especially for those in Edmonds Village and the Creekside Village Apartment Community.

5 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

Truck traffic and congestion along DuPont-Steilacoom Rd. is bad enough without exacerbating the problem by expanding the mining operation. Trucks driving illegally through the city where our children play also continues to be a problem. Until more improvements are made to ease congestion from truck traffic, this project should be rejected.

6 EA

If you have OTHER concerns not listed above, please describe them below.

This operation already depletes our community of resources without giving much back in return, save for a minor annual goodwill project that very few care about. As a community, we must work vigilantly to protect our interests and resources so
our city can remain a peaceful, beautiful, desirable place to live. Approving the mine expansion project does not benefit our community in any meaningful way. Rather, this project has the potential to remove many of the features that make DuPont so beautiful and has the potential to hurt existing residents due to decreased property values and increased strain on natural resources and civil resources. The nominal tax revenue brought in by the expansion does not justify the additional burden placed on all residents of DuPont.

7 EA

Barb Kincaid, AICP
Director of Public Services
City of DuPont
1700 Civic Drive
DuPont, WA 98327

RE: Pioneer Aggregates South Parcel Project – SEPA 2021-002

Dear Ms. Kincaid:

I am writing on behalf of Basalite Concrete Products LLC in support of the Pioneer Aggregates South Parcel Project (SEPA 2021-002) and to comment on the recently released Draft Environmental Impact Statement (DEIS).

Basalite Concrete Products Dupont location was established in 1995. The primary reason for the selection of this property is the proximity to raw materials, the Pioneer aggregate site. Basalite Concrete Products manufactures concrete masonry units, pavers, retaining walls, and other concrete accessories. In addition, on the site, we produce Drymix packaged products, such as concrete mix, mortar, grout and specialty packaged construction products. The site employs just over 50 employees with many employees over 25 years at this location. The site runs our own dump trucks to supply ourselves with approximately 24 – 26 loads per day of material coming from the Pioneer site.

In addition to supplying Home Depot and Lowe's, a couple of major projects supplied by this site include Tacoma Community College, Lakes High School, and a variety of DOT Retaining Walls, plus retaining walls at the Home Course.

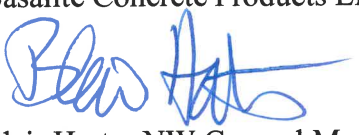
1
EA

In 2018, the Dupont site installed robots on the packaging line. The first use of robots in a concrete block plant in North America, costing millions of dollars. The site is frequently visited from Concrete producers across the Country to see the equipment in use. In fact, I invite your team to come and visit our site.

Not approving the Pioneer Aggregate project would have a significant impact on our business, the employees, and the projects in our pipeline. It is important that regulatory reviewers do not overlook the important economic contribution the Pioneer Aggregates facility makes to the regional economy and the businesses and livelihoods that depend on this resource.

Thank you for taking the time to review and consider these comments.

Sincerely,
Basalite Concrete Products LLC



Blair Harter NW General Manager

If you have concerns regarding the EARTH, please describe them below.
Main concern is the environmental impacts to natural resources- sequalitchew creek and forests

If you have concerns regarding the AIR QUALITY, please describe them below.
Destruction of forest areas will negatively impact air quality

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
Mining activities will negatively impact the sequalitchew creek ecosystem

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
Mining activities will negatively impact the sequalitchew creek ecosystem and animal habitats

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
Mining activities will negatively impact the sequalitchew creek ecosystem and adjacent forest lands and animal habitats

If you have concerns regarding NOISE, please describe them below.
Noise will impact animal habitats and the trail enjoyment

If you have concerns regarding LAND USE, please describe them below.
Forests and animal habitats ought to be protected.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.
Natural coast line should be protected to preserve its beauty

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding the EARTH, please describe them below.
We loose too much nature not every piece of land needs to be built on

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.
The air wouldn't feel as fresh from all the dust and exhausts

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
The sequalichew trail is beautiful and we need to protect the plants and wildlife who depend on the aquifer. Many plants would dry out and die in the hot and dry summer months and it would be devastating. It should kept natural and not ruined for a business to make money!

3 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
We need to protect them they should stay untouched. They are a huge asset for quality of life for humans, wildlife and plants.

4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
They would suffer

5 EA

If you have concerns regarding NOISE, please describe them below.
The trail is so relaxing and noise would ruin the peace walking the trail

6 EA

If you have concerns regarding LAND USE, please describe them below.
We should only allow the minimum requirement by state law and nothing more. Most moved to DuPont for the small town feel and nature. For homes we should build any apartments. Higher end homes and duplexes only.

7 EA City

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

Adding as many homes as proposed would cause a big traffic problem. Most families have 2-3 vehicles

If you have OTHER concerns not listed above, please describe them below.

Please keep DuPont safe, protect our natural resources and don't allow building more apartments. We moved here for a family friendly environment and apartments bring in lower income and young residents who don't share the same interests as most people moved here for

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

With the removal of healthy vegetation via dewatering our aquifer, we are inviting an increased risk of wildfires to these areas- ones that could have devastating consequences for our communities, including loss of habitats, homes and reducing air quality during the summer months.
Reduction in water levels locally will reduce overall vegetation, that will reduce air quality year round.

1 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Dewatering to allow for additional gravel mining will have truly devastating effects on our environment and community.
If the Vashon Aquifer is Dewatered we KNOW the Sequalitchew Creek will go dry for approximately five months each year during the hottest parts of our seasons- increasing risks of drought driven wildfires and destabilizing the ground as roots die off and making them less resilient once rains return. This means the slopes on Sequalitchew Creek Trail will go dry and the established seeps will be eliminated. These seeps maintain the vegetation and proper environment that make the creek flow. The effects to the local water table of West Edmond Marsh is estimated to be lowered up to 9 feet. This would also affect the other wetlands in DuPont will be lowered up to two feet, destroying much needed water habitat for local wildlife populations and destabilizing wildlife predator/prey relationships in the area.

2 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Dewatering of our aquifer to allow for additional gravel mining will have a long-term negative impact on the areas local wildlife.
Reduction of available water resources will lead to increased wildlife loss as well as citizens seeing more wildlife activity in and around developed communities as wildlife populations seek out new water/vegetation sources. This includes predators who will need more water availability and who will follow their natural prey into populated areas.

3 EA

If you have concerns regarding NOISE, please describe them below.

Additional mining operations will increase noise pollution in the area, increasing traffic as well as more vehicles will be added to accommodate mining activities.

4 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

Loss of our trails will directly impact the citizens of DuPont; reducing trail access due to environmental impacts, potential of wildfires in the region spreading across newly created drought zones, increased wildlife activity across the city and residential communities, as well as overall reduction of our cities natural habitats in favor of yet another business development at the cost of our access to our land resources.

5 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

We have to stop the unnecessary development and expansion of large businesses in our community- growth for growths sake is gutting our community destroying the appeal of our city, and is literally killing off our natural habitats despite citizens having made our stance clear. SAVE DUPONT.

6 EA

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

I am very concerned about the effects that n available potable water to the city of Dupont. I am also concerned about the ecological impacts to drying up the Sequalitchew creek ravine.

1 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

I am concerned that the rich flora and fauna of the Sequalitchew creek ravine will suffer irreparable harm for very minor financial gain relative to the value of the creek ecologically.

2 EA

If you have concerns regarding NOISE, please describe them below.

I live in Creekside village and have concerns about the noise from the project. The current quiet nature of our complex is likely to be disrupted. Especially if mining begins in the southern parcel.

3 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding the EARTH, please describe them below.

We have lived in Dupont Edmonds Village for over 20 years now. Growth is great, however, this kind if growth is unwelcome! You're taking away our beautiful, healthy, life filled community. This is the reason we all live here. Go somewhere else where you are not affecting lives, and environment! NO NO NO! 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Taking all our trees down, ruining the environment for your greedy pockets. Our air quality will diminish rapidly, not to mention fire hazards! 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

The groundwater is what keeps Dupont green, healthy and helps shield us from worse fires/fire seasons. You do not need to develop here! There are plenty of other uninhibited locations for you to destroy! 3 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

These are natural waterways which must stay intact for a healthy environment! You take this away and you will again be forcing animals and humans out! NO NO NO! 4 DS

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

It's obvious, you come in, everything is either dead or having to move elsewhere! This is not a healthy choice to destroy Dupont! NO NO NO! 5 EA

If you have concerns regarding NOISE, please describe them below.

Omg! We already have to put up with Amazon and Ft. Lewis. NO MORE! NO NO NO! 6 EA

If you have concerns regarding LAND USE, please describe them below.

We are already over developed. We do not need anything more! NO NO NO 7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

Asthetics/Visual? We will be be just another ugly, over industrialized unfriendly place. NO NO NO!!!

8 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

Cultural, it will be all but destroyed if you develop! NO NO NO!

9 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

Dupont is already busy being #1 detour for I-5, we don't need any more transportation issues! NO NO NO!

10 EA

If you have OTHER concerns not listed above, please describe them below.

Leave DUPONT alone, we are a thriving family friendly community. You are not welcome! NO NO NO!

11 EA

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.
My concerns are over development and taking away habitat for wildlife

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.
Evey little thing counts the healthy air we breathe mean a healthy life!

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
Over developed land, effects every little thing! This area is OVER DEVELOPED

3 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
Again over development and runoff effects our environment.

4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
Being redundant here! But over development effects us all!

5 EA

If you have concerns regarding NOISE, please describe them below.
There is already to much noise! From Amazon trucks all hours of the night to the increase of traffic and of course those inconsiderate humans that cause this over development and bring it here!

6 EA

If you have concerns regarding LAND USE, please describe them below.
Loss of Habitat should be a concern, am I missing something here? PLEASE educate me!

7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

Elizabeth Jellison

2284 Wallace Loop

DuPont, WA

July 13, 2024

Dear Members of the City Council,

I am writing to express my deep concern regarding the proposed expansion of Calportland's mining operations in our community. I believe allowing this expansion would have devastating effects on our water sources, forests, and the overall well-being of our community. 1 EA

The impact on our water resources is particularly alarming. Increased mining activities can lead to contamination of groundwater and surface water, jeopardizing the health and safety of our residents who rely on these sources for drinking water. Furthermore, disruption to natural water flows and sedimentation can harm aquatic habitats and ecosystems, which are vital for maintaining biodiversity in our region. 2 DS EA

The proposed expansion also threatens our forests, which play a crucial role in providing clean air, absorbing carbon dioxide, and supporting wildlife habitats. Clear-cutting and habitat destruction associated with mining operations would irreversibly damage these natural assets that are essential for our community's quality of life. 3 EA

Moreover, the social fabric of our community could suffer significant negative consequences. Noise, dust and other disturbances associated with mining would disrupt the peace and tranquility that residents cherish. Additionally, property values may decline, affecting homeowners and businesses alike. 4 EA

Given these concerns, I urge the City of DuPont to carefully consider the long-term environmental and social impacts of allowing Calportland to expand its mining operations.

Thank you for considering my views on this important matter. I respectfully request that the City Council prioritize the protection of our water, forests, and community well-being in its deliberations on this issue. 5 EA City

Sincerely,

Elizabeth Jellison

If you have concerns regarding the EARTH, please describe them below.

My main concern is the water, however the information I posted in the water section also applies to the Earth because of the negative impact to the carbon emissions increase.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

My main concern is the water, however the information I posted in the water section also applies to the groundwater.

2 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

A massive world-wide study of dry riverbeds has found they are contributing more carbon emissions than previously thought. There is a substantial amount of plant litter that accumulates in dry riverbeds and when they flow again this material can breakdown rapidly. "We believe that a single pulse of CO2 emission upon litter rewetting contributes up to 10% of the daily CO2 emission compared to perennial rivers and streams, particularly in temperate climates. What this means is that the contributions of intermittent rivers and streams should be included in global carbon-cycling assessments," said Dr Waltham. Wetlands are ecosystems that are vital both for humankind and nature. They are commonly the most valuable ecosystems in a landscape providing many beneficial ecosystem services. Wetlands play an important role in climate change, because of their capacity to modulate atmospheric concentrations of greenhouse gases such as methane, carbon dioxide and nitrous oxide, which are dominant greenhouse gases contributing to about 60%, 20% and 6% of the global warming potential, respectively (IPCC, 2007). Additionally, changes in physical habitat and food base from river source to mouth profoundly influence biological communities. Besides the scientific evidence that supports constant waterflow all year long, my husband and I walk an average of eight miles a day on Dupont trails. We cross the Edmond Village bridge every day and it angers us every day when we look down to the river/creek and see a bone-dry waterway. Hydrologists have long recognized the interconnected nature of groundwater and surface water. When you mismanage the waterways, you impact the vegetation, water conditions downstream, and animals living in and around the waterway. When we walk down the Sesqualitchew Creek trail, we enjoy the sounds of the water flow and occasionally the sight of birds diving in and out of the water or deer drinking from the stream. Rivers and streams also provide crucial pathways for aquatic and terrestrial organisms to move and migrate to find food and avoid predators. Every time you allow the creek to dry up, you impact the natural conditions, basically devastating local organisms, vegetation, and impacting the creatures that rely on the creek water downstream. You also contribute to climate change and my emotional health in a negative way.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Allowing this will decrease the water available in seeps, and the creek will run dry when normally it is not. This is a huge increased risk for fires, and will disrupt a gorgeous part of DuPont. This cannot be allowed.

1 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

This will irrevocably change the environment by degrading the amount of water here for ecologically significant durations of time

2 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

Will kill many of the beautiful vegetation in the area.

3 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

This is not responsible stewardship of the natural resources here.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

My concerns are that the beautiful and unique ecosystem and trails in DuPont will be heavily impacted or possibly destroyed in its current state by the mining.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

As the ecosystem is likely impacted by the drilling for the mining, trees will be affected as well, which in turn will affect our air quality. I am also concerned about dust pollution.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

It is difficult to say how much of an impact this all will have on the groundwater, however it is likely that we have not been fully informed about that.

3 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

I am concerned that the current landscape that makes DuPont such a beautiful place to live in will slowly disappear.

4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Animals will be disturbed in their natural habitat.

5 EA

If you have concerns regarding NOISE, please describe them below.

Mining will surely be causing more noise pollution, which will not only impact DuPont's human inhabitants but also its wildlife.

6 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

A large amount of DuPont's residents are military members or dependents and are often on the move after a few years. I think a lot of these upcoming changes are unknown to a lot of its inhabitants because of the only temporary living situation for many. Anybody I know loves the trail system in DuPont and it is unique and to be preserved for years and generations to come.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

The Vashon Aquifer will be drained for this project. This is unacceptable. The riparian habitat of the Sequalichew Creek basin will be killed. The vegetation and animals that rely on this stream will die off. This is a vital ecological habitat to the endangered species of the Puget Sound. The drinking water for the city of DuPont will be reduced in a time when droughts are becoming more common. This project will harm the people and animals who live in the city of DuPont.

Letter 118

RECEIVED
JUL 15 2021
CITY OF DUPONT

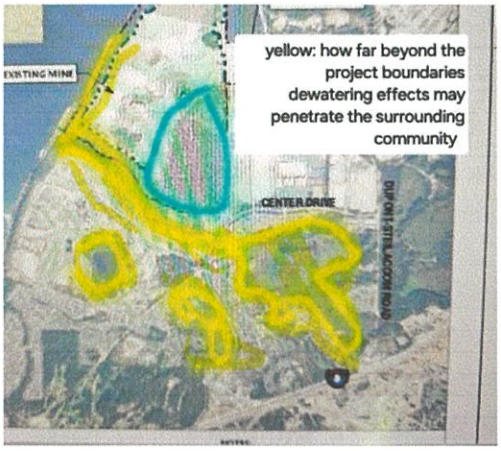
Pioneer Aggregates South Parcel Project, City File No. SEPA2021-002
Attn: Barb Kincaid

Please accept my comments re: the DEIS

Range of Options: There is 1 alternative and a 'no action' with 2 scenarios. Per SEPA handbook, there should be a 'range' of alternatives. The history refers to a range: 'three other possible alternatives - 1- less mining on the South Parcel and/or at the Existing Mine, 2 - preserving the Kettle Wetland, and 3- no dewatering by wells for mining and creation of an interceptor channel southeast of Edmond Marsh' and in 2010 a "Study completed, analyzing 24 alternatives for mining of the North and South Parcels." The project might have been broken down with a second alternative of expanding the mine for the 188 acres without the deepening and catastrophic aquifer breech.

1 EA

Alternative 1 Impacts extend too far beyond private company's project site



The main action option provided is not acceptable; permanent impacts that need mitigation are well outside the boundaries of the project/property to mined. The cumulative effects of Alt 1 will reach far into neighborhoods and time. This private company has rights to work on their property but giving away an entire community's future precious water resources for them to turn a profit in a time of Federally recognized climate crisis and frequent drought does not make sense, especially when only a 'potential' solution is offered. . "The U.S. Geological Survey compares the water stored in the ground to money kept in a bank account" and the mine will make a total withdrawal and no guarantee to replenish it.

2 EA

I would like to see more forecasting information for worst case. "Current drinking wells are not projected to be affected" but we are about to develop 2 more subcommunities and changing climate will drive up our water use not only for drinking but the repeated droughts will cause more need for watering intervention for vegetation. Currently no action alternative 2 is the only water conserving option.

3 DS EA

Restoration Plan: We are told the Alternatives and the Restoration Plan are separate but the plan is referred to 259 times in the DEIS body. Without degrading the aquifer, it appears in Alternative 2 No Action, we could also conduct a restoration plan and from a much less degraded start point: 'There is a potential that the Sequalitchew Creek Restoration Plan could be implemented without the Proposed Action (alternative funding sources would be necessary) and cumulative conditions would be generally similar to Alternative 1'

4 EA

Re:Fish/Salmon, Alternative 1 outcome with the current restoration plan does **not** provide creek flow or temperature to current conditions present today under 'no action' Alternative 2 so alternative 2 would be an improvement e.g. maintaining natural spring flow.

5 DS EA

Consider again the map above. We cannot compromise an entire community's water level, flora and fauna habitat and human enjoyment in the surroundings for 'potential'; the words that need to be used below are **'will restore'**, whatever the cost, whatever it takes for restoration and maintenance especially if the system is so artificial it cannot sustain itself: "The Sequalitchew Creek Restoration Plan has the **potential** to restore an annual average of 12.9 cfs to a 1,200-foot reach of Sequalitchew Creek that currently experiences little to no consistent flow. Seasonally, the flows in this reach following restoration are predicted to be between 2.5-cfs in August up to just over 26 cfs in March"

6 DS

The city should not be left bearing the fiscal burden of failure for a 'potential' solution. Alternative 1 could be presented with multiple restoration scenarios as Alternative 2 is.

7 EA

Fiscal/Costs: 3-12 FISCAL: I feel is not as rosy as stated for Alternative 1. There are direct and indirect fiscal costs of the city on such a project in employee time for project/mitigation compliance that would go well into the future that are not addressed. Some type of significant additional financial assurances of any mitigation project success seems in order. If an artificial water system is effected it will need maintenance and if the restoration plan fails what will the city be left with?

8 City EA

In the Groundwater, Mitigation section the mitigation appears to only cover the mine project in use. The effects of this and any mitigations must cover years, if not a century; research indicates it will cost the entire community long after the mine has pulled up stakes. Again we are losing a long term investment: "The U.S. Geological Survey compares the water stored in the ground to money kept in a bank account"

9 DS

How do we account for possible indirect losses e.g. there is a possible loss of tourist revenues to local business from the regional attraction of Sequalitchew Creek where people buy lunch in town before and after hiking the Creek trail as a more frequently dried up creek with experimental replacement vegetation and more arid look may not have the same refreshing allure to hikers.

10 EA

Adaptive Management mentioned later as part of the restoration plan also appears to require sustained, continuous funding for monitoring and assessment, essentially adding some kind of FTE/more employee hours which are likely permanent since the warranting condition never returns to baseline.
https://www.doi.gov/sites/doi.gov/files/migrated/ppa/upload/TechGuide.pdf

11 City Cal

Noise

3-7 Noise: The noise estimate is incomplete and relies on 'models' which is lazy when **we can ask people** who have lived next to the mine for years and get actual data about the human experience of living like this. I have already done this for another land use project opposite

12 Cal EA

Edmunds village and was surprised when I doorbelled focusing on trucks to learn that yes, people were suffering from truck backing signals but also found disgruntled citizens on Hudson who could not leave their windows open and were unable to sleep at night, including a miserable veteran with PTSD, from clanging, crashing sounds and machinery to me consistent with mine operations by description.

13 EA

Later I personally experienced the potential sudden shock level of noise about to be faced by residents of Creekside Apartments when working at the DuPont Community Garden. At a minimum, less night time construction and mining operation hours and retrofitting Creekside with noise suppression windows and ensuring air conditioning if not present would be necessary mitigations for Alternative 1 and should have been done for Hudson Ave for the original mine operation.

14 Cal

3.7.1 Environment: Noise, the City regulation is too weak to provide residents' quality of life. Small numbers cited e.g. "potential increases of 8 to 16 dBA really add orders of magnitude increase" are explaining a doubling or tripling in decibels is a doubling or tripling in sound power.

15 City EA

Unexpected On/off noises produce a burst across frequencies very disturbing to humans. There is ample evidence of the biological hazards to humans from living in expected/chronic noise and unexpected/brief duration noise that are not captured in the city ordinance but will affect humans in Creekside Apartments and Creek hikers seeking quiet communion with nature may not have been accounted for: This assessment was restricted to **residential** receptor locations potentially affected by increases over existing levels under the Proposed Action.

16 Cal EA

Since the proposal borders a natural area, noise scoping might need to include wildlife? https://stateline.org/2019/10/22/noise-pollution-hurts-wildlife-but-states-have-trouble-turning-down-the-volume/

Trees Alternative 1 has unacceptable landmark tree destruction when we do not meet minimum canopy for climate adaptation. Would the habitat be lost for 10 yrs or a replacement forest created simultaneously. Even so, protected white oaks are included but should not be removed as the canopy of : "oak woodlands provide a mix of feeding, resting, and breeding habitat for many wildlife species. More than 200 vertebrate and a profusion of invertebrate species use Washington's oak woodlands. Some species occur in especially high densities, whereas others are not typically found in Washington. Oaks provide habitat for species that are state listed as Sensitive, Threatened, Endangered, or candidates for these listings.

17 EA

https://wdfw.wa.gov/sites/default/files/publications/02465/wdfw02465.pdf

Other Possible 'Missing, incomplete or incorrect information':

Scenic and Recreation impacts on the human users should be discussed in addition to aesthetics. The human voice which the SEPA process seeks to capture seems to be missing and trail hikers' perspective may be overlooked. They are only mentioned 3 times near the end of the document.

18 Cal EA

Mammals: Update the gray squirrel section reclassified from threatened to endangered as the status has changed. Also, JBLM includes Eagle's Pride golf course to the SW as well as Tatsolo Point and the firing ranges and all of DuPont Steilacoom road which are not separated from DuPont at all. Dismissive language like **'unlikely'** implies no actual investigation of the squirrel's presence: 'once been within the historical range of gray squirrels but is *unlikely* to be occupied by the current population". Actual surveying and current census would allow actual evaluation of options rather than wishful postulation. 19 Cal EA

Amphibians [and other fauna e.g. feeding birds]: Interactions with wetlands are too vague. E.g. if a water body like Pond Lake drops by 2 ft and goes dry a month earlier, aquatic and semiaquatic life, e.g. already threatened NW pond turtles, is impacted e.g.reproduction, spawning, hatchlings and future population and ecosystem survival in our community 20 Cal EA

Insects and bugs, e.g. butterflies, are not addressed as a category that will be impacted.

3.10 Not certain, but seems like the DuPont Historical Society should also have a role here and they are not mentioned. 21 City

Since the proposal borders a natural area, noise scoping might need to include wildlife? https://stateline.org/2019/10/22/noise-pollution-hurts-wildlife-but-states-have-trouble-turning-down-the-volume/ 22 Cal EA

3.8 Land Use. Tree Planting is a discreet act while maintenance and watering are continual. Mitigations should cover both the planting and maintenance through maturity or a specified goal achievement. 23 Cal

3.9 Aesthetics. References the reclamation plan but not enough information here to tell if, as above, it covers a one time act or maintenance until satisfactory, aesthetic maturity has been achieved. 24 Cal

Thanks you for your consideration.

If you have concerns regarding the EARTH, please describe them below.

I walk the Sequalitchew Trail every morning, 7 days a week. My phone has more video of wildlife and critters than anything else. I regularly see rabbits, squirrels, lizards, snakes, chipmunks, birds of all variation, sea otters, seals, and the thought of their homes being disturbed upsets me greatly. For them whom have been shoved out of so many spaces already, and for me because these walks made it so I came out of the pandemic with grace. I see families getting quality time sharing the outdoors and time together walking the trail as I did when mine were young and even now. I see soldiers using our trails for early morning training and by doing so, getting a glimpse into what Washington has to offer as a duty station. I have seen an eagle fly through the gully above the creek once. I also live at Creekside Village and have for about 6 years now and hate the thought of losing our tranquility behind our apartments and untainted view. I beg if you not to do this. If this happens it will be the final push for us to move from DuPont. Thank you for reading this.

I regularly see rabbits, squirrels, lizards, snakes, chipmunks, birds of all variation, sea otters, seals, and the thought of their homes being disturbed upsets me greatly. For them whom have been shoved out of so many spaces already, and for me because these walks made it so I came out of the pandemic with grace. I see families getting quality time sharing the outdoors and time together walking the trail as I did when mine were young and even now. I see soldiers using our trails for early morning training and by doing so, getting a glimpse into what Washington has to offer as a duty station. I have seen an eagle fly through the gully above the creek once. I also live at Creekside Village and have for about 6 years now and hate the thought of losing our tranquility behind our apartments and untainted view. I beg if you not to do this. If this happens it will be the final push for us to move from DuPont. Thank you for reading this.

If you have concerns regarding TRANSPORTATION, please describe them below.

I walk the Sequalitchew Trail every morning, 7 days a week. My phone has more video of wildlife and critters than anything else. I regularly see rabbits, squirrels, lizards, snakes, chipmunks, birds of all variation, sea otters, seals, and the thought of their homes being disturbed upsets me greatly. For them whom have been shoved out of so many spaces already, and for me because these walks made it so I came out of the pandemic with grace. If you have concerns regarding the EARTH, please describe them below.

I am highly concerned about the mining and proposed aquifer drawdown due to local mining and the impact it will have on our land and community. There are serious longterm implications for allowing this to project proceed. You should have the interest of the people of Dupont at the forefront of your mind for decision-making, not any personal gain. And.. the people of Dupont do not want to allow the dewatering of our aquifer. Please make the right choice!

I am concerned about the impact that this project will have on the Sequalitchew Creek water levels. I do not wish to see the creek dry up (even for just a portion of the year) as a result of dewatering the local aquifer.

I would also like to preserve the option to use the aquifer as a potable drinking water source for the City of Dupont. This will allow for business growth as well as keeping our future options open.

If you have concerns regarding the EARTH, please describe them below.

Please find another place to dig gravel. This trail is used regularly by student athletes, outdoor enthusiasts, military, and local residents. Tearing up pristine land do a little more gravel seems far too destructive.

RECEIVED
JUL 15 2024
CITY OF DUPONT

Letter 124

Dear Director Kincaid,

Sadly, in my 20+ years living in DuPont, it often feels like "circling wolves" are trying to devour our town and our quality of life until absolutely nothing is left. In my 20+ years, I have also seen DuPont citizens successfully rally round to save our city.

Thus, I am extremely concerned about the proposed CalPortland South Parcel mine expansion for several reasons.

1. The impact on the groundwater level due to dewatering the Vashon Aquifer. This could significantly affect surrounding vegetation and increase fire danger for our residents, homes, and businesses. It would dry up the seeps along the Sequalitchew Creek Trail, causing the hillside slopes to dry up. 1 DS

2. The South Pacel the creek water alongside the trail would go dry for almost half of the year. Currently, the underground water from the Vashon Aquifer feeds the lush hillside as well as the creek and our wetlands. Please DO NOT approve a mining permit that will destroy our stream, our hillside, and our wetlands IN PERPETUITY. No mitigations exist, nor is any mitigation proposed that would protect our environment. 2 DS

3. The projected drop in the groundwater level of up to 9 feet in Edmonds Marsh is of specific concern. Other areas of concern include the drop in groundwater level in Pond Lake, wetlands 8, 9, and 10, and Old Fort Lake. Additionally, the elimination of the Kettle Wetland and the drying up of seeps and springs feeding Sequalitchew will likely dry out the vegetation surrounding the City of DuPont. 3 DS

4. Climate conditions have worsened since the 2011 Settlement Agreement was prepared. DuPont is surrounded by forests, and climate change is already increasing the risk of fire to our residents. The resulting decrease in the groundwater level from the mine expansion will likely put DuPont residents at an even greater risk of fire. 4 DS

5. Restoring Sequalitchew Creek does not have to depend on dewatering the Vashon Aquifer. It should be restored without dewatering. In fact, CalPortland could be a great community partner by funding the restoration WITHOUT dewatering the aquifer. 5 Cal

6. This proposed expansion will cause irreversible damage to Dupont's economy. The Sequalichew Creek Trail and adjacent areas are the one thing that sets DuPont far apart from other towns. Visitors consistently come to walk or bike trail systems, frequent business and special events, word of mouth spreads… DuPont thrives. What impact will the resulting environmental destruction have on our families, elders, the children. How many people will move away? What about property values? 6 EA

I imagine when CalPortland looks at DuPont, they don't see forests, wetlands, history, families living, loving, nor a home… they see profit margins. "We see it. We take it. We leave it"

I ask, what will our legacy be?

In Peace,

Karen Konrad - (karenkonrad@aol.com)

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Through the research I did after seeing the notice, it seems this project will severely impact sequalitchew creek. The impact on the creek does not seem worth the revenue from letting the mine expand.

1 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

This is one of the most beautiful locations we have access to in the south sound, and before I lived in DuPont I would frequently come to walk the trail. A big reason I moved here was to be able to enjoy that trail more frequently. I'm surprised this plan is even open for discussion and wasn't immediately struck down, although I imagine that could be due to local rules/laws.

2 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

I don't think anything I could write would adequately articulate how negatively I feel about this project. I do not think anyone who lives in DuPont would disagree that the only entity who would benefit from this is the mine.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.
see comment regarding GROUNDWATER/AQUIFER

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
I am concerned that the proposed expansion of the mining operation will materially alter the water ecology of the area, which will have a negative domino effect on the surrounding ecosystems. The old growth forest by Sequalichew Creek is one of the many stunningly beautiful spots in the area. I am one of nearly 10,000 residents in DuPont and we treasure our trails as they afford us respite and recreation near our homes. The system of recreational trails and nature are important to the quality of life in DuPont and deserve protection and consideration. The mining operation should not be allowed to materially alter the ecosystems that surround DuPont.

DuPont, WA 98327

RE: Pioneer Aggregates South Parcel Project – SEPA 2021-002

Dear Ms. Kincaid:

I am writing on behalf of Lakeside Industries, Inc. (Lakeside Industries) in support of the Pioneer Aggregates South Parcel Project (SEPA 2021-002) and to comment on the recently released Draft Environmental Impact Statement (DEIS).

Lakeside Industries is a family-owned asphalt manufacturing and paving company with locally-managed regional divisions spanning Western Washington and Northwest Oregon. Lakeside Industries currently has over 700 employees, including over 500 union employees. Our asphalt plants provide road construction materials to residential, commercial, and industrial properties throughout this community. Pierce County residents drive on roads paved by Lakeside Industries every day.

Lakeside Industries is a customer of the existing Pioneer Aggregates facility, and we rely on the resources from this mine for our asphalt products. The quality and availability of these materials are essential to maintaining our high standards and fulfilling our commitments to our clients. Facilities like Pioneer Aggregates are indispensable in providing the quality sand and gravel necessary for road construction operations. Our industry depends on a steady supply of these materials to build and maintain the infrastructure that supports our community's growth and development.

1
EA

The mining industry plays a significant role in the local and regional economy by supplying essential materials to development projects, offering employment opportunities, and stimulating economic activity in the area. The Pioneer Aggregates facility is situated within the mineral resource overlay and is ideally suited for mining operations. Upon completion of mining, the mined-out lands can be repurposed for various uses, adding long-term value to the community. This adaptive reuse of land is an important aspect of sustainable development.

The existing operation has a proven track record of delivering high-quality materials for businesses and development projects across the region. It is in an ideal location to supply local construction projects. Local sourcing of sand and gravel materials reduces energy consumption, lowers overall costs, and minimizes environmental impacts. Utilizing nearby resources significantly lessens the carbon footprint associated with transporting materials over long distances. Sand and gravel resources are crucial to Washington's infrastructure and development. Adequate supply of these materials is vital for the construction of roads, housing, retail spaces, and commercial developments, all of which are cornerstones of economic growth.

2
EA

The DEIS shows effective mitigation of environmental impacts. Traffic impact from this project on I-5 ramps and city intersections would be negligible, with no adverse impacts projected from the South Parcel proposal. The fiscal analysis indicates that the project would generate a surplus for the City of DuPont, ranging from $18,400 to $125,700, contributing positively to the city's budget. The project includes comprehensive mitigation measures designed to limit environmental impacts, demonstrating a commitment to responsible and sustainable mining practices.

3
EA

In conclusion, Lakeside Industries supports the proposal to expand the Pioneer Aggregates facility. Expansion of this operation is vital to our business, the local economy, and the sustainable growth of our community.

Thank you for considering our perspective on this important matter.

Sincerely,

Jaime Lee
President
Lakeside Industries, Inc.

If you have concerns regarding the EARTH, please describe them below.
We need to take care of Earth. But do it through and educated lens. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.
Air quality must be monitored and improved. Once again be smart and educated and what is best 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
No concerns. Our water is fine i am one of the few who read the report 3 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
No

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
We must protect habitat and repair if possible.
We did a lot of damage to Earth before we paid attention. 4 EA

If you have concerns regarding NOISE, please describe them below.
None

If you have concerns regarding LAND USE, please describe them below.
None

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.
None but we should maintain policy to keep our city beautiful. Use responsible planning to do this. 5 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

I'm filling this out because of CAL Portland mine expansion.
I have been to plant and seen their plan.
They will repair fix far more than they will hurt.
Everyone should take a look.
They will replace the creek like it should be. The army moved it in the 60s. Clean topsoil etc.

I would be willing to speak openly at any meeting about this.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Please oppose the destruction of Sequalitchew Creek. The Dupont gravel mine operated by CalPortland is seeking permission to "de-water" the Vashon Aquifer adjacent to the creek,this will destroy the creek. Do not let that happen. We are stewards of future generations and we have failed them for 100 years. It's time to preserve and protect. Aquifer destruction leads to a host of problems plainly visible in California. They include sinking land and sink holes. This is short sighted. Say no. I regularly visit Dupont and am working up to buying a home and considering what area. If this goes through I will remove Dupont from consideration.

1 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Save wildlife by saving the Vashon aquifer.

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

Deny CalPortland's Dupont Gravel Mines request to destroy the Vashon aquifer.

2 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

Watersheds are cultural assets. Save the Vashon aquifer.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

Pits and quarries disrupt the existing movement of surface water and groundwater; they interrupt natural water recharge and can lead to reduced quantity and quality of drinking water for residents and wildlife near or downstream from a quarry site. 1 DS EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Mining can emit particulates into the air, including PM-10 particles, which can pose respiratory health hazards. 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Pumping groundwater for domestic consumption, irrigation, or mining can cause bodies of water and wetlands to dry up. This can also lead to the death of fish, wildlife, and trees 3 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Overdrawing groundwater can cause the land to sink, which can lead to sinkholes or slowly damage large areas. This subsidence can destroy buildings, roads, and underground pipe systems. 4 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Open-pit mining removes topsoil and vegetation to access materials, which can destroy habitats for animals and plants. Mining can also destroy freshwater and ocean habitats by removing sand and gravel from riverbeds, lakes, and seabeds. 5 EA

What is the name of the Agency or Organization?

Chamber Clover Creek Watershed Council Board

If you have concerns regarding the EARTH, please describe them below.

I live int he Parkland-Spanaway area and have great concerns about our aquifer and the role it plays in groundwater levels pushing up and replenishing the gravel that is more healthy for fish populations that accumulated silt at the bottom of a creek. Sequalitchew is no different that way from the Clover. They are all part of the same watershed. So the proposal to dewater has potential to harm a wider area of the same aquifer, one the City of Dupont does not have jurisdiction over.

1 EA DS

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

The watershed WRIA12 extends over a wider area than just the City of Dupont. Acts that affect it could potentially extend to JBLM, Lakewood, Parkland, Spanaway Frederickson, Graham, and some of South Hill. In Parkland Spanaway we are already seeing the lower groundwater from excessive growth and water use cause our stream to be dry almost 10 months a year now. It used to flow year-round. Sequalitchew needs to be restored for the local fish populations, but to tie dewatering to that is an unfair trade.

2 EA DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Dams, diversions, pond creation, and other disturbances to the surface water hurt insects that feed birds, lizards, and fish. It affects trees, native bushes that bear fruits, and the overall aesthetic pleasure of a natural environment. As we build these days, those in construction find it easier to strip everything instead of leaving the good things in place. SO many creatures needs to other artifacts int he environment to survive. Who are we to be so arrogant?

3 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Fish need gravel at the base of their creek, groundwater helps that happen by flowing up and displacing it. Animals, reptiles, and insects are the lower-level food resources for the larger animals, like listed Blue Heron.

4 EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

I am the Historian for the Descendants of Fort Nisqually Employees Association. Myself and my companions (most are also tribal members), care deeply about the disturbance and destruction in the vicinity of the historic sites. And Fort Nisqually employees themselves are guilty of some of the destruction. We should be learning from past mistakes, not making more. Yes, the historic glaciers from the past left some awesome gravel in the area. But when have we taken enough?

5 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

Aesthetics, like removing the site where I took a photos of a ghost shaped like Chloe Clark? Impacting the site of the Methodist mIssion. Or the visual of changing the landscape so dramatically, one cannot recognize or imagine how it once looked in the past? For 50 years of my life, I waited to get a chance to see and sense the real site of Fort Nisqually, not the one that I visited at Point Defiance, but the real place where the people operated, worked, lived and died. Opening the Dupont property gave me that chance, but I am sad to see the things you do to it that ruin the experience for us who are sensing individuals. I will not attach, but I can provide the Chloe Clark ghost photo if requested.

6 EA Cal

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

I am the second generation of my family to advocate for caution in the Dupont area regarding cultural artifacts. My mother's name is definitely in the archives of your town expansion. Our property with a miden is in the Nisqually Land Trust now. Impact on future generations should always be a huge consideration.

7 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

NA

If you have OTHER concerns not listed above, please describe them below.

Tribal members would understand this. I am attaching a photo. As I was writing the part about the necessity of insects as part of the food chain, something flew onto my arm. (I am in my house, but just came in from running a weed whacker.) A ladybug flew off my arm and onto my computer. You can see in the photo I am working on my comments. The insects have spoken too.

If you have concerns regarding the EARTH, please describe them below.

How much more destruction and/devastating change of natural environment is needed in the name of capital gain?

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Changing the course of natural water & streams is sure to impact all that depend on its existence.

2 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

This is one of the most important aspects of this project. The impact on fish/plants/animals/birds is one that will no doubt be detrimental for generations to come.

3 EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

As Native (*not a local tribe), what should be treasures & respected, is destroyed for capitalism. As a resident of duPont for 20 years, I've seen time & time again the consideration for surrounding land & that of the town changed & not for the better. Empty buildings, trees uprooted for a golf course? Empty warehouses? More & more housing at astronomical pricing? The beauty of what is natural is slowly being exterminated. And for what? Gravel?

4 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

I'm not as knowledgeable as many others in this matter but I do understand that this project is wrong. The devastating results will be irreversible. And again, for what, so Cal Portland benefits? Grant you, they do put on the rock find. Thank-you for the opportunity to express my thoughts on this. I hope that it impacts the decision in a positive way, that is to not go forward with this project.

5

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

When the warehouses on Center Drive and DuPont-Steilacoom Road were put in around 10 years ago I remember for several days after there was an increase of birds flying around my house. All the birds that were displaced from the trees being cut down there were competing to find new homes. I can't imagine how many there will be this time as there will be even fewer places for these animals to relocate to and there could soon be even less places in a few years with other development plans being proposed around the Old Fort Lake subarea plan. There is also the potential that the endangered gray squirrel is living in the forest that would be cut down, taking away even more of its habitat.

1 EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

One of the comments I hear a lot of people mention about DuPont is how nice it is that there are so many trees and forests nearby that help the town feel more connected to nature. Over the years a lot of them have been cut down which has made the remaining forests more valuable for DuPont to retain this part of its identity. Coming down Center Drive its nice that after a line of warehouses there is large forest near Powerline Road. With that section gone I feel the town would lose part of its charm. With other development plans being proposed, saving as much forest in town is increasing in importance from an aesthetic standpoint as well as from a climate standpoint.

2 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

The area that is proposed for this project is a part of an area that is connected to so many parts of DuPont's history dating back to the Sequalitchew Band. From a historical standpoint, it would be a shame to see an area with such rich history be altered even more than it has been. The history of DuPont is a large part of its identity and this feels like it goes against that.

3
EA

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

People come from all over the state to walk along the Sequalitchew Trail to either appreciate its natural beauty or to take in its historical significance. When I walk it I enjoy the seclusion it provides. With this proposed expansion it feels like it would hurt peoples enjoyment of the trail. While the project won't be visible from the trail, the change in the animal life there will be felt. Part of the history will feel like it has slipped away. The feeling of being secluded and one with nature won't be the same knowing how close the mine is.

4
EA

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

The aggregate in this DuPont mine is a valuable resource for the region. The mine is also located in an area that is ideally separated from residential uses. The mine area when all resources are extracted would make a gorgeous recreation area if a lake were allowed to be formed. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

I have lived in town for almost twenty years and have never felt any air quality impact from the mine. I would want all existing operating procedures that minimize dust to continue. 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

The mine has operated successfully for many years without negative impact to the groundwater or aquifers. My belief is that it appears their plans call for the shallow aquifer will be diverted properly with no impact to the city's wells and water supply. 3 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Much history has revolved around restoring Sequalichew Creek. The mining company has expended time and resources to help achieve restoration of the creek and salmon. This is a noble goal but requires good faith by all parties. I have been concerned that environmental stalling has been employed with Cal-Portland. This is not good faith. 4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding NOISE, please describe them below.

All protocols that minimize noise and protect residential values in the community should continue. 5 EA

If you have concerns regarding LAND USE, please describe them below.

A high value natural resource exists in our city in the form of aggregate. The comp plan requires that we identify it and protect the resource. You can only mine where the resource exists. Land use planning is designed to protect values and minimize conflicts. I think this mine has proved it can operate with nominal impact.

6 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

Continue to require buffer areas and visual barriers to essentially isolate the mining operation from other uses in the area.

7 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

Cal-Portland has been a regular contributor to the cultural amenities in our community. I would hope that they would continue to demonstrate their investment in the community.

8 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

The fact that most the aggregate leaves the sight on barge is very positive. With the new exit 119 overpass and I-5 improvements, I think the surface transportation issues will be largely improved.

9 EA

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

It would be horrible to see such big machinery and destruction in my backyard. The forest is my peace and gravel mining is not worth taking that away from so many people. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

We shouldn't have to sacrifice air quality for gravel mining. 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

This could not only wreck the stream ecosystem, ground water around the houses but the ocean aswell. 3 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

The western grey squirrel is now endangered and uses are creek as refuge. Gravel mining would effectively displace them from their habitat entirely 4 EA

If you have concerns regarding NOISE, please describe them below.

It's always loud enough here with artillery and explosions. Living so close to the creek would mean that I would never hear just the sounds of the forest again. 5 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

I feel like the dust is getting increasingly worse each year and I can't imagine the mining doesn't have at least some effect. They must ensure a deeper pit doesn't change what's following the wind to toen

1 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Since the pit will reduce the aquifer's flow to the creek as planned, there must be a better solution or else it should not go through. The Sequalitchew Creek trail brings so many outsiders to town, as it offers a rainforest-like gentle hike with a wonderful view at the end. If it's just a dusty, dirty trail it won't maintain the coolness in summer or the beautiful surrounding of nature to entice visitors to come, let alone encourage the citizens of DuPont who pick that trail instead of the shortcuts because of its beauty. The shortcuts would absolutely be used more frequently, which could make the hillside unstable and lead to unsafe conditions there too

2 EA DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding NOISE, please describe them below.

In the summer months there's much less of a buffer on sound and it can indeed carry well. Any mining is noisy, and I certainly prefer less prolonged noise

3 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

When the mining is deemed done, I would love to see portions of it repurposed as something recreational for the townspeople a la the Tenino quarry pool or the Spokane skate ribbon or the Leavenworth skate park. I'm concerned that if we just keep extending, keep extending, keep extending, the mining will never be done

If you have concerns regarding the EARTH, please describe them below.

My family loves to walk the Sequalitchew Creek Trail. It's a peaceful area surrounded by trees providing shade on a sunny day and the sound of the creek flowing. I would hate for any of that to change.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Trees, of course, help with air quality. If you cut them down, you will be affecting the environment.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

We love the sound of the creek flowing as we walk down the trail. I would hate for the water to dry up. Leave the area as is.

3 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Our community has already affected so much of the environment around us. The creek trail is a little bit of the natural environment. Leave it alone. Let the creek continue to flow. Not only do we enjoy it as is, but the animals do as well.

4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

It is a natural environment is a community setting. This creek trail should be preserved. It's a place close to home where we can get away and enjoy nature. We can see native plants and animals living in their natural environment.

5 EA

If you have concerns regarding NOISE, please describe them below.

Absolutely concerned about noise. We love the natural environment of the creek trail. It's nature right in our backyard. We can relax as we stroll down the trail and hear the birds and the creek. We don't have to worry about hearing cars, equipment, etc.

6 EA

If you have concerns regarding LAND USE, please describe them below.

As I mentioned before, it's a piece of nature in our own backyard. Leave it alone. Let the creek flow naturally. Let the trees grow. Let the deer, squirrels, birds, etc. have their natural environment.

7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If the trees are cut down and the creek dries up, what's the point of the trail. We like it as is. It's a comforting, quiet, natural environment right in our own backyard. Please don't make any changes.

8 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

N/A

If you have concerns regarding TRANSPORTATION, please describe them below.

The only concern I have about transportation would be the noise that the company would make and the change to the natural environment of the trail. I want to hear the creek and the birds, not vehicles.

9 EA

If you have OTHER concerns not listed above, please describe them below.

We love the trail for the location to our home, for the peaceful environment, for the sound of the creek and the birds chirping. I would hate for any of that to change.

10 EA

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

Impacts outside of the development area:
Increased wildfire
Loss of potable water
Loss of water for vegetation for both city properties and personal property owners
Loss of water and wildlife habitat for salmon, orcas, and aquatic life in Nisqually Reach and Salish Sea
impacts to all wildlife including those on the endangered species list.
Impacts to humans with loss of suitable drinking water, property loss

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Please consider HEAL act implications surrounding worsening air quality for all individuals living in DuPont. We are seeing an increase in poor air quality due to wildfire activity. As the water table is lowered substantially in our wetlands and marsh, this is creating an increased risk for wildfire. Loss of trees means loss of vegetation that can clean our air. We live next to I-5 which already has negative impacts on the city. HEAL act maps from ecology shows DuPont at a higher risk NOW because of this. There are serious concerns about how this will worsen if the application is approved.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

GROUND WATER / AQUIFER
Page 3.3-13, Water Supply
The City of DuPont is in the process of installing giant filters to clean out PFAFs from its existing water supply at the Hoffman Hill and Bell Hill water facilities. This was brought on by contaminated water that entered the water source from JBLM. Future water supply will be in jeopardy if this mine expansion is allowed to move forward. Without water, there is no life. It would be foolish to eliminate any potential future water supply for existing homes and future development. That's exactly what this mine expansion into the south parcel will do if this expansion is allowed to move forward. The cost associated with trucking in water for residents and businesses would be astronomical. This has not been captured in the application, and the city does not have a current revenue stream or a plan in place to pay for such a service.

3 DS City

Page 3.3-20 and 3.3-21 CALCULATED GROUND WATER LEVEL CHANGES:,
The map does not show Center Drive, which is a major road in the city of DuPont. Adjacent to Center Drive are hundreds of homes and businesses in the area where ground water is expected to be lowered. The map is deceiving and not transparent. The lowering of the water table in a residential and wetland area will only increase wildfire threat and stress vegetation more than we've seen in recent years. Is CalPortland going to pay residential

4 DS City

property owners for new watering systems because of the 7-to-18-foot drop in ground water? That's just in the residential section alone. Lowering the water table by draining the Vashon aquifer will dry up Sequalitchew Creek Canyon. It will forever lower the ground water a whopping 69 FEET. This WILL forever change its ecology and kill ALL the wildlife that currently call it home.

4 cont.

USGS has well established cause and effects of dewatering and lowering of a water table in communities across the United States. They identify Groundwater as a valuable resource both in the United States and throughout the world. Groundwater depletion, a term often defined as long-term water-level declines caused by sustained groundwater pumping, is a key issue associated with groundwater use. Many areas of the United States are experiencing groundwater depletion. Is the city of DuPont prepared to deal with the aftermath of dewatering that includes water contamination, sink holes, property loss, increased wildfire risks, increased negative air quality because of the loss of vegetation (due to ongoing drought).

5 DS EA

The application identifies that ground water flows primarily in the Vashon Aquifer and the Sea Level Aquifer. Under the Proposed Action with the Sequalitchew Creek Restoration Plan, unavoidable adverse impacts to the surface water system of the Sequalitchew Creek watershed would include the Vashon Aquifer water table would significantly decrease in the vicinity of the South Parcel. Groundwater levels beneath Edmond Marsh, particularly at the west end of the marsh, would see long-term groundwater level declines of up to 8.73 feet. Groundwater discharge in the Sequalitchew Creek ravine is expected to significantly decrease (by an annual average of up to 83%) during the Proposed Action and is expected to provide on average 79% less baseflow to Sequalitchew Creek following the Proposed Action.

6 DS

The EIS clearly indicates that the drawdown of the Vashon Aquifer is anticipated to affect groundwater and surface water features within a one to two-mile radius from the proposed mine site. This drawdown will have enormous hydrologic impacts to the marsh system and other areas far outside of the development site. It is inconceivable how impacts this far-reaching can even be mitigated.
DuPont official zoning map has Sensitive areas and open space marked throughout the 1-2 mile radius where there will be significant drop in the water table – upwards of 70 feet.

Page 3.3-13
Impacts of Alternatives
Let's discuss the Sequalitchew Creek Restoration Plan. The idea to restore Sequalitchew Creek for salmon and other aquatic habitat is a worthy discussion and investment. AND IT DOES NOT NEED TO BE TIED TO A MINING APPLICATION OR PERMIT. Has funding been identified for the restoration plan? How long will that funding be available? Once the Vashon Aquifer is drained, the city will forever need to be pumping water into the west end of Edmunds Marsh and the Sequalitchew Creek Canyon in perpetuity. This vastly expensive endeavor has zero financial resources dedicated to it. It is not a sustainable option. Dewatering of the aquifer will kill and permanently alter the ecosystems around the city of DuPont and the connectivity between each wetland. This is something the city was designed around. Citizens value shaded trails to run, walk and bike on. DuPont is one of the rare communities that has connectivity for pedestrians and bikes that keeps ecological systems intact. The trees and vegetation around those trails will disappear with the mine expansion into the south parcel. The application, as in 2007, is flawed and will forever alter the city's community values with are found in the city's comprehensive plan. Make this 17 year disaster STOP NOW.

7 DS

Enter the DuPont Municipal Code Open Space District: 25.55.010
The purpose of this district is to recognize those lands which are not intended to be developed due to the presence of wetlands, wetland buffers, steep slopes and other sensitive areas and their buffers as provided in Chapter 25.105 DMC, and recognize lands designated for parks, greenbelts, open space and tree preservation areas and regional storm drainage detention areas in addition to open space and landscape areas as mutually agreed to by the property owner and city. In addition, some open spaces are intended to preserve historic and Native American cultural sites. A network of trails is intended to link open spaces with one another and with other community facilities. (Ord. 02-707 § 1)

8 EA

The Restoration plan and any phased mitigation plan is in direct conflict with DMC 25.55.010 as it will permanently alter a significant portion of DuPont's open space and critical areas. The lowering of the water table will kill the tree canopy and all existing vegetation.

9 EA City

The groundwater contingency mitigation measures proposed on page 3.3-33 are not sustainable for reasons described by the USGS. Pumping groundwater into Edmumds Marsh and Sequalitchew Creek in perpetuity is not feasible or reasonable. Where is the mitigation funding to keep this system operational for 200 years or more? The EIS clearly indicates that the drawdown of the Vashon Aquifer is anticipated to affect groundwater and surface water features within a one to two-mile radius from the proposed mine site. This drawdown will have enormous hydrologic impacts to the marsh system and other areas far outside of the development site. It is inconceivable how impacts this far-reaching can even be mitigated.

10 DS City

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

It's not clear where the wetland categories are located. In 2007, Sequalitchew Creek Canyon was classified as a class 1 wetland, and it was easy for all to see how each marsh and critical/sensitive area was categorized. This information is missing from the provided documents, and a search function of the pdf's is not available. This needs to be flagged as an issue with not all information is available to comment on. Bell Marsh is listed frequently in the wetlands and ground water sections. It needs to be noted that Bell Marsh is considered a Category 1 wetland in the I-5 Mounts Road to Thorne Lane Corridor Improvements EIS and SEIS.
https://wsdot.wa.gov/sites/default/files/2021-11/I5-JBLM-Vicinity-FINALMay2017EA-ExecutiveSummary.pdf

11 Cal City EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Areas with which state or federally designated endangered, threatened, and sensitive species have a primary association. Federally designated endangered and threatened species are those fish and wildlife species identified by the U.S. Fish and Wildlife Service and the National Marine Fisheries Service that are in danger of extinction or threatened to become endangered. State designated endangered, threatened, and sensitive species are those fish and wildlife species native to the state of Washington identified by the Department of Fish and Wildlife;

12 EA

If you have concerns regarding NOISE, please describe them below.

Loss of trees will only increase Noise for residents. People living in Edmunds Village and Palisade Village already are impacted at times by noise coming from the mine. Mining the south parcel will only increase the decibles creating a hardship for existing property owners. Keep in mind, the proposal to expand the mine first came in 2007. Northwest Landing was well established. Homeowners were here first. There could also be HEAL act implication to this.

13 EA

If you have concerns regarding LAND USE, please describe them below.

Enter the DuPont Municipal Code Open Space District: 25.55.010
The purpose of this district is to recognize those lands which are not intended to be developed due to the presence of wetlands, wetland buffers, steep slopes and other sensitive areas and their buffers as provided in Chapter 25.105 DMC, and recognize lands designated for parks, greenbelts, open space and tree preservation areas and regional storm drainage detention areas in addition to open space and landscape areas as mutually agreed to by the property owner and city. In addition, some open spaces are intended to preserve historic and Native American cultural sites. A network of trails is intended to link open spaces with one another and with other community facilities. (Ord. 02-707 § 1)
The Restoration plan and any phased mitigation plan is in direct conflict with DMC 25.55.010 as it will permanently alter a significant portion of DuPont's open space and critical areas.

14 EA City

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

Loss of trees for nearby residential will decrease property value.

15 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

There are historical monuments in the proposed mine expansion area. This needs to be documented.

16 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

Not sure why WSDOT isn't one of the reviewers. This will be an increase in trips on I-5. Current expansion on I-5 will only meet projected ADT through 2045. The department has zero funding for future expansion. Additional mitigation funding will likely be required by the applicant to the state for their impacts on the highway.

17 EA

If you have OTHER concerns not listed above, please describe them below.

Proposed Mitigation is Inadequate. The ground water and surface water mitigation plan to convey intercepted groundwater seepage from the eastern slopes of the proposed mine expansion area to discharge into the ravine section of Sequalitchew Creek or West Edmond Marsh is inadequate. First, it is not clear how this would achieve equivalent or greater biological functions resulting in no net loss of wetland function as required under the city code. Second, the cost of conveying water would be prohibitive. CalPortland is not going to have a permanent presence in the city and the EIS is unclear as to who will pay for water conveyance 25, 50 or 100 years down the road. The impacts of this action are permanent and will impact generations of residents. More broadly, there is also a high likelihood of unexpected consequences from drawing down an aquifer that underlies a large portion of the city, which includes current residential and commercial areas. A substantial mitigation fund should be established in light of unforeseen adverse impacts.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

General Principles. In light of climate change and existing water contamination issues (PFAS), DuPont's aquifers are a critical resource for the city and require the highest level of protection. Additionally, the proposed activity by CalPortland is not contained within the development area. The DEIS clearly indicates that the drawdown of the Vashon Aquifer is anticipated to affect groundwater and surface water features within a one to two-mile radius from the proposed mine site. This drawdown will have enormous hydrologic impacts to the marsh system and other areas far outside of the development site. It is inconceivable how impacts this far-reaching, impacting other public and private properties, can even be mitigated. 1 DS

Proposed Mitigation is Inadequate. The ground water and surface water mitigation plan to convey intercepted groundwater seepage from the eastern slopes of the proposed mine expansion area to discharge into the ravine section of Sequalitchew Creek or West Edmond Marsh is inadequate. First, it is not clear how this would achieve equivalent or greater biological functions resulting in no net loss of wetland function as required under the city code. Second, the cost of mechanically conveying water would be prohibitive. CalPortland is not going to have a permanent presence in the city and the DEIS is unclear as to who will pay for water conveyance 25, 50 or 100 years down the road. The impacts of this action are permanent and will impact generations of residents. More broadly, there is also a high likelihood of unexpected consequences from drawing down an aquifer that underlies a large portion of the city, which includes current residential and commercial areas. For example, dewatering can cause the ground to lose structural integrity potentially damaging structures. In short, a substantial mitigation fund should be established in light of unforeseen adverse impacts. Lastly, the restoration plan, which is technically separate from the EIS but is referenced as a source for additional mitigation, would only provide topological modifications to the marsh system. However, the restoration plan, in no way, addresses the permanent and far-reaching negative consequences of infiltrating the Vashon aquifer. 2 DS City

What is the name of the Agency or Organization?
DuPont Chamber of Commerce

If you have concerns regarding the EARTH, please describe them below.
The products that I carry in my salon are environmentally friendly. I believe it is our responsibility to leave the Environment better than we found it, We only have one earth.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.
Being asthmatic , Air quality is extremely important to me. I know on days where we have fires and where the air quality is bad I struggle more I live in the Pacific Northwest because many times the air quality here is so much better than other places..

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
I wish I understood it more. The trail is Extremely important to our community and businesses because it draws people in to use. But I also understand that people like Bridges and the gravel that comes from Calportland is important to maintain our infrastructure.

3 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
Water is extremely important to our planet and the streams in wetlands and surface water provide habitat for our animals and water for us... It's a resource that should not be taken for granted.

4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
Animals and fish should be protected and care for as we are as humans the protectors of our planet.

5 EA

If you have concerns regarding NOISE, please describe them below.
Noise is subjective as a matter fact, my neighbors don't like the noise that my house creates. I have three kids and we're noisy. However, when I want to sleep, I'll turn on white noise on my TV and when I've lived in big cities, sometimes the sound of traffic is actually comforting because it creates that white noise. Noise is something that is very subjective. .

6 EA

If you have concerns regarding LAND USE, please describe them below.

I believe that people should be more involved in learning about how land is used in their communities it extended the Siri comprehensive plan at the library recently and I think it's interesting. How land use his planned and that honestly citizens can have a great impact on that by talking to their city officials and the people who are developing..

7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

I think DuPont is amazing because we have green space and because we have a HOA that make sure that the city looks aesthetically pleasing, however, I've been to cities that develop organically, and I love to see gardens in the front of the house, or other countries where Graffiti is placed in the walls and it's beautiful so again I'd like to just say aesthetics are subjective .

8 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

Because so many things have been taken from our indigenous people, I think cultural resources are extremely important and should be respected. Especially here in Dupont, where our sequela chew tribe lived for so many years before white people ever arrived, and they had a culture that we came and took from them and impose our culture upon them. I do believe more could be done to help protect the resources of the Nisqually in our area.

9 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

I believe transportation should be expanded in the city of Dupont. I'm excited for the train line, even though I'm gonna be old when it's finally done, I wish we had local buses and bike lanes and better trails and transportation should be an absolute. Priority

10 EA

If you have OTHER concerns not listed above, please describe them below.

I think that there seems to be a hard stance between two different factors, but I think there's no reason why people can't work together to just figure this out. Perhaps Cal Portland would like to put money toward protecting the sequoia Trail and making it a national or historical landmark and also a state park and pay for resources keep that up for the public that way people could enjoy it and mine and provide gravel for roads and bridges and things like that which are also necessities.

11 EA

Dupont Chamber of Commerce

If you have concerns regarding the EARTH, please describe them below.
I'm resubmitting this because somehow I submitted a rough draft typos and all so I'm gonna do this again. This is my official statement.... Yes, I think with global warming, and human impact we are seeing Wildlife, habitation, water issues for communities, oceans, rising, really big impacts on our earth. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.
Being an asthmatic, air quality is very important to me. As we've been having so many fires in the last several years, I have been majorly impacted by our air quality here in the Pacific Northwest. Developing nations, such as China and India suffer from terrible air quality every day I worry about the children of the world and their future. 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
Groundwater is always a concern. As we've seen companies in Michigan, or in developing nations that suffer with poor water, and chemicals in the water it is Scary. I believe there are a lot of people that are only concerned about money and not about the health of humanity. I am not sure about what is happening with here in Dupont, I do know that businesses also deserve a chance. But I am a big advocate for the environment and you can see that in my Salon business I carry only eco-friendly lines. 3 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
I believe these are very fragile systems and that humans have a great impact on them and we've seen our salmon impacted by dams. Wetlands are particularly fragile. And here in Dupont, we have a lot of these things, and we have a unique beauty for our city. 4 EA DS

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
We as humans have a stewardship of the earth and we have greatly impacted Fish and plants already. We should greatly review the things that we do to our city to make sure that these things are not impacted, but again, however we also live in country where we need infrastructure, and as I understand it, Calportland is providing many of that resources for us to live every day life and I would love to see if there was someway we could come to an agreement to protect the environment, but also provide for our lifestyles 5 EA

If you have concerns regarding NOISE, please describe them below.

As I stated previously, I don't mind white noise... We deal with a lot of noise already from the military base. And the freeway.

6 EA

If you have concerns regarding LAND USE, please describe them below.

Landis use important here in DuPont, We are very planned out community, but I feel the city is doing a good job with planning.

7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

We have a very planned out city with green space. I would hate to see that impacted, and I think it's important that our trail remain aesthetically pleasing, though I feel it could be improved and possibly a sponsorship could be arranged with Calportland in the state to make the trail Estate park as historical landmark ... Perhaps with A visitor center where we can learn about the environments and history of our trail and draw people into the community and perhaps Portland would be helping to pay with for that if they get to mine.

8 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

When Europeans are white man landed here on the northwest landing in the Puget Sound cultural resources of Nisqually were greatly impacted. The development and advance of the West Change everything for indigenous people, and I never believe we have fulfilled an obligation to return what was theirs. In regards to our trail, there's a lot of history that needs to be protected

9 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

I believe we need better transportation here in Dupont to include buses perhaps with Pierce County and I'm very excited about our train line.

10 EA

If you have OTHER concerns not listed above, please describe them below.

I truly believe that this is not a black or white situation and that we could come to some sort of agreement that would help everyone in this situation. Environment and our infrastructure can be held up and business flourish.

11 EA

If you have concerns regarding the EARTH, please describe them below.

Additional mining that would create hazardous conditions should an earthquake occur and that could adversely impact that surrounding area even with blasting are not acceptable. Additional possible pollution escape into the delicate Puget Sound ecosystem is also not acceptable. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Mining will create additional dust and debris in the area, particularly in the summer months where we see decreased air quality due to fire season. Why decrease air quality, particularly near schools? There is no reason to do this. 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Reducing water flow and dewatering an aquifer for mining is unacceptable. The impact on the town and the flora and fauna of the surrounding areas seems to be underestimated. In a time where many communities are looking to restore the flow of creeks to encourage salmon spawning, DuPont seems to be doing everything possible to further destroy water sources, increase fire danger, and degrade the Sequalitchew trail and surrounding wilderness areas even further. 3 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Wetlands provide a critical habitat and environmental protections. Changing flow rates and relocating wetlands irrevocably changes the ecosystem and destroys critical habitat. Agains, you will destroy habitat that cannot be remade for the interests of a commercial company that will in no way benefit DuPont residents. 4 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Habitat loss is already an issue in DuPont and the animals present are competing for little space. This means that humans will have more interactions with bears, deer, and coyotes within the town, increasing the danger. Again, relocated habitat doesn't always mean that you maintain the critical biodiversity from the original area. We have see , across the nation, a massive drop I insect life and this, biodiversity. Reducing water flow and destroying habitat will amplify these issues and the mining should not proceed. 5 EA

If you have concerns regarding NOISE, please describe them below.

I already deal with explosions from JBLM trading, let's not add additional explosives for type purpose of stripping the earth.

6 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

We stole the land from the Nisqually and are now stripping it bare. We have no idea what valuable sites we could be destroying with this mine.

7 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

No more trucks driving through our city! When we have back-ups on I-5 the air quality gets dramatically worse. Large vehicles impact the roads and create unsafe conditions for other drivers and pedestrians.

8 EA

If you have OTHER concerns not listed above, please describe them below.

DuPont should be working with JBLM to restore Sequalitchew creek and the salmon runs that were on e there; not working to dryer the aquifer and clear cut more trees. We should look to re-establish as much forested land with native species versus encouraging the growth of invasive species with changes to the aquifer and wetlands. Please do not approve this project. I can see no benefits to DuPont residents, only downsides. The city has a history of approving light industrial and other projects that seemingly do not benefit residents, only add to noise, traffic, and a loss of natural areas. With only two ways to get to I-5, we do not need to be adding to these issues. We do not need to increase fire danger by lowering water levels and water flow and putting a possible source of drinking water in danger. Shame on the city for even considering this proposal.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
What guarantee do we have that it will not create problems with our groundwater? And if it does, who will be held accountable. Are all tests done and can be viewed?

1 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
We have wild life that live there. What studies have been done to protect them?

2 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
Yes, I do have concerns. Animals and creatures keep losing their homes because of growth. We see coyotes walking down the street like off leash dogs.

3 EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.
We, as well as others, not just folks from Dupont have enjoyed hikes through this lovely area. It's a learning lesson for small children about nature. The creek is lovely as it is, undisturbed.

4 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.
The act to dewater the aquifer shows extreme disregard for life in our city of DuPont, including human, wildlife, flora, fauna, and water. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.
The same effects for the EARTH apply to AIR QUALITY 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
We need pure, clean water, not contaminated from mining residue. 3 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
We need the few streams we have all of us and all of nature. 4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
Many species of birds and animals use that area for nesting habitat. This will no longer be available. 5 EA

If you have concerns regarding NOISE, please describe them below.
The noise of mining will greatly disturb the animals and humans in the area. They will no longer come. 6 EA

If you have concerns regarding LAND USE, please describe them below.
We need the land around the Sequalichew Creek to protect it and make it available for future generations. 7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.
What an ugly sight that will be---barren and industrial! We have beautiful land and nature here. Please don't destroy it! 8 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

There are historical markers along this trail which need to be preserved. Dupont has a rich history. Please don't destroypart of it!

If you have concerns regarding TRANSPORTATION, please describe them below.

This will cause problems with school transportation and make it unsafe for many children walking to school.

If you have OTHER concerns not listed above, please describe them below.

Cal Portland has enough area here already and doesn't need to expand, especially when it involves the wildlife and nature of DuPont, as well as human recreation.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

DuPont is in the Cascadia Fault system which has geologically been active in the recent past and is anticipated to be active in the future. The band of land between the Sequalitchew trail and the proposed mine are very narrow in scope. Should we endure another earthquake similar to or exceeding the magnitude of the 2001 7+ event we had, the land could give way hurting the biome. The soil in the Puget Sound has been noted to be at high risk during an earthquake for liquefaction (loosely packed, water-logged sediments at or near the ground surface lose their strength in response to strong ground shaking). The project encroachment should be re-evaluated to provide a wider body of trees to maintain soil integrity.

1 Cal EA

If you have concerns regarding the AIR QUALITY, please describe them below.

None.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

None.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

None.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

We are removing more habitat space and giving nothing back to the community for it. What do the citizens of DuPont get for the removal of forest and natural biome for our species? If the company is going to expand the mine, what will they do for the community? This sounds like a one-sided benefit to industry.

2 EA

If you have concerns regarding NOISE, please describe them below.

The band of trees should be wider (between the project and the trail/community) preventing industrial noise from polluting the Sequalitchew trail area. This project appears to be within 100' of the natural space.

3 EA Cal

If you have concerns regarding LAND USE, please describe them below.

The project appears on the graphics (without distance legend) to be conducting industrial work in close proximity to the Sequalitchew Trail where kids and families frequent and will also abut a housing center which harms the quality of life that so many have come to enjoy from DuPont. If it is necessary for industry to knock down another forest (in addition to the woodlands that are being leveled for housing in the near future), a wider band of tree line should be maintained. This would serve as noise abatement that we citizens are being asked to take on. It would also serve as a buffer against the general eye-sore this project will give us.

4 Cal

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

We are expanding a giant hold in the ground to access glacial sediments for concrete mixing. We are removing a forest to accommodate this "aesthetic failure." I would still like to know what "WE" citizens of DuPont are recieving from this project?

5 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

We are one step closer to becoming Kent, Washington. A bastion of warehousing, urban sprawl and industrial expansion. I moved to DuPont as it was a special place that did not appear to wipe out all of its natural beauty. Culturally, we are selling our town out.

6 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

If the trucks can stay to the current industrial roads, no issue.

7 EA

If you have OTHER concerns not listed above, please describe them below.

I believe my points have been listed and would be more than willing to talk with the council about them if called upon.

8 EA

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

RECEIVED
JUL 2 2024
CITY OF DUPONT

June 30, 2024

Dear Director Kincaid,

Thank you for the opportunity to comment on the Pioneer Aggregates South Parcel Project City File No. SEPA2021-002. I have been a resident of DuPont since August 1996 and reside at 1485 Kittson Street. During my long residency in DuPont, I have followed the development of the dry gravel mining operation to the current proposal to dewater the Vashon Aquifer to mine its water saturated gravel.

Therefore, I favor a recommendation of **No Action** due to the destructive environmental impact that the mine expansion would have on Sequalitchew Creek, the Sequalitchew Creek Trail's slopes, Edmond Marsh, the four other wetlands and a potential source of potable drinking water for DuPont, the Vashon Aquifer.

RCW 90.92 Watershed Planning clearly states that "The purpose of this chapter is to develop a more thorough and cooperative method of determining what the current water resource situation is in each water resource inventory area of the state and *to provide local citizens with the maximum possible input concerning their goals and objectives for water resource management and development.*"

1 EA

The 2011 Settlement Agreement is continually cited as the basis for allowing the South Parcel mine expansion. I have always wondered how a settlement agreement can supersede state law as well as local authority.

Our 2015 DuPont Comprehensive Plan and Critical Area Ordinance (Chapter 25.105) contain provisions that should prevent the issuance of a permit for expanding mining into the South Parcel. Below are key elements from the Comprehensive Plan and the CAO that safeguard the Vashon Aquifer from dewatering.

2 City EA

DMC Chapter 25.105 Critical Areas

The primary purposes of this chapter are "…to protect the public health, safety and welfare by preventing the adverse environmental impacts of development."

DMC 25.105.010: Directing a policy of no net loss of wetland and stream function, Value, and area within the city.

DMC 25.105.010: Preventing, to the extent practicable, adverse cumulative impacts to water quality, wetlands, stream corridors, and fish and wildlife habitats using best available science.

DMC 25.105.010: Protecting the public from injury, loss of life, property damage or financial loss due to flooding, erosion, landslides, seismic events, soil subsidence or steep slope failures.

3 City EA

2015 Comprehensive Plan

Resource Land Goal LU-10: Recognizes the value of mineral resource extraction while protecting the natural environment's integrity. **LU-10.3** Ensure mining activities employ best management practices that protect the long-term integrity of the natural environment, water resources, adjacent land uses, and the long-term productivity of the resource lands.

Natural Environment Goal NE-1: Protect DuPont's natural environment by meeting the needs of today's citizens without compromising the needs of future generations. **NE 1.1** Preserve environmentally sensitive areas and those that are valuable natural and aesthetic resources to the City **NE 1.2** Institute and regularly update measures which promote development and construction practices that minimize impacts on the environment

4 City EA

GROUNDWATER/AQUIFER

I believe this DEIS was written to support CalPortland's quest to dewater the Vashon Aquifer to mine gravel. The DEIS is clear that by dewatering the aquifer, the Sequalitchew Creek Ravine (off-site) will dry up as the seeps and springs are expected to be reduced or dewatered in their entirety, as noted on page 3.1-14. The DEIS also notes that the Sequalitchew Creek ravine is in a landslide hazard area per the DMC. On page 3.1-14, it states, "The seeps and springs identified on Figure 3.1-3 are expected to be reduced or dewatered in their entirety, which may reduce the level of landslide hazard susceptibility within the ravine." Of note is the word "may."

5
EA
DS

The statement that reducing or dewatering the seeps and springs in their entirety "may" reduce the level of landslide susceptibility within the ravine appears to contradict groundwater dynamics associated with dewatering a lush slope in a riparian corridor, which shows dewatering such a slope could lead to instability and landslides.

Effects of Dewatering on Creek Slopes

Foundational science and research in groundwater dynamics show that when a typically wet and lush steep hillside dries up, several changes occur due to the lack of moisture:

6
DS
EA

- **Vegetation Stress:** The lush vegetation that thrived in wet conditions may struggle or die off. Plants adapted to moisture may wilt, lose leaves, or become dormant.
- **Soil Erosion:** Without the binding effect of wet soil, erosion becomes a concern. Rainwater can wash away loose soil particles, leading to gullies and landslides.

- **Cracking and Compaction:** As the soil dries, it contracts and cracks. This can reduce its stability and make it less suitable for supporting plants or structures.
- **Loss of Habitat:** Animals and insects that rely on the wet environment may move elsewhere or face challenges finding food and shelter.

6 cont.

The devastating effects that dewatering will have upon the slopes in perpetuity are glossed over in the impact analysis. The science is available to support the effects of reducing or eliminating the slope seeps. However, this science would not support the goal of dewatering the Vashon Aquifer to mine gravel, which isn't as easy to come by as the gravel they are currently mining in the other parcels.

7 EA DS

I read nothing in the DEIS that provides mitigation that would negate the impact of reducing or dewatering the Vashon Aquifer seeps on the Sequalitchew ravine walls, resulting in:

- Drying up the vegetation on the ravine walls
- No groundwater flowing from the seeps into Sequalitchew Creek
- Temperature changes in the creek due to the loss of cool groundwater
- Decreased biodiversity due to the impact of the loss of groundwater effects in the ravine
- Drying up vegetation along the creek banks

8 EA DS

The Sequalitchew Creek Trail is one of South Puget's Sound recreational treasures. The cool riparian environment and rich history draw visitors to our city. One only needs to look at the full city hall parking lot and talk to visitors on the trail to see how beloved this trail is.

9 EA

Fire Hazards

The DEIS makes no mention of the potential fire hazards that could result from the Sequalitchew Creek Ravine becoming a dry tinderbox. Our climate has become considerably hotter, with less rainfall, since 2011 when the Settlement Agreement was signed, as seen in these data from the University of Washington Climate Impacts Group: https://climate.washington.edu/climate-data/trendanalysisapp/

10
EA
DS
Cal

- **Temperature Increase 2011-2023:** From 2011-2023, temperatures, as captured in the Seattle area, have risen 1.06 F.
- **Precipitation Decrease 2011-2023:** Precipitation has decreased by 9.9% in the same time.

Impact on our Wetlands

The DuPont Municipal Code 25.105.050 Critical areas clearly states: "Wetlands in DuPont also have a positive effect on water quality downstream or in aquifers by removing pollutants through the processes of sediment trapping, nutrient removal, and chemical detoxification. Wetlands also regulate the flow, retention, and release of stormwater to surface and groundwater systems. An equally important concern of the proposal to mine the South Parcel is the impact of the Vashon Aquifer dewatering on our wetlands, marshes, creek, and surrounding environment. In their proposal, it clearly states:

11
DS
EA

- West Edmonds marsh groundwater level will decrease by 9 feet
- Pond Lake water level will be reduced by 2 feet
- Wetlands number 8, 9, and 10 water level will be reduced by 1 foot

- Old Fort Lake will be reduced by 0.05 feet
- The Kettle Wetland will be eliminated
- The seeps and springs that feed Sequalitchew Creek will dry up

11 cont.

These groundwater levels will be reduced forever! The decrease in groundwater will lead to the loss of vegetation, loss of stream flow, loss of habitat, and decreased ability to remove pollutants and will add drought-like conditions to the Sequalitchew Creek Ravine.

Potable Water

The Vashon Aquifer is a potential source of potable water in DuPont. In the past, the Historic Village used the Vashon Aquifer as a drinking water source, and DuPont still has water rights issued in 1948 to the Vashon Aquifer: https://appswr.ecology.wa.gov/docs/waterRights/ScanToWRTS/SWRO1/pdf/SWRO10000202F.pdf

On pg 1-13 of the 2019 DuPont Water System Plan Update, the city states that "City holds water rights for two decommissioned wells in the Historic Village." and notes that they have been decommissioned. On pg. 1-17 the city writes "All of the City's wells operate under municipal water rights that are not automatically subject to relinquishment for non-use. However, a water right could be deemed to be abandoned if no valid point of withdrawal currently exists for the right. *For this reason, the City intends to pursue designation of one or more of its existing wells as a point or points of withdrawal under the El Rancho Madrona and Historic Village water rights.*"

12 EA Cal City

Table 3.13, Projected Water Right Analysis, notes that "Based on these projections it appears that the City of DuPont has adequate annual withdrawal water rights to cover the projected demands for the 20-year planning period." up to 2038. However, in 2024 WA state required the City of DuPont to accommodate growth for an additional 5,000 housing units, with 2.5 people per household on average.

On pg. 3-47 of this report titled "System Deficiencies" the text states, "It is pointed out under the heading *Water Rights Analysis* that the City should protect their existing, currently inactive rights for the El Rancho Madrona well and for the Historic Village wells by adding one or more of their existing active wells as points of withdrawal on those currently inactive rights. Also, in planning for buildout, the City of DuPont will pursue transferring existing water rights for Weyerhaeuser golf course wells to one or more active City wells, and will continue to pursue the new water right application G2-30221." This new water right application was submitted in 2004 and has not been granted yet.

12 cont.

The DEIS merely notes, regarding water supply wells, on page 3.3-29 that "No water supply wells are known to exist in the site area which tap the Vashon Aquifer, and therefore none would be impacted by the Proposed Action." This assertion claim ignores the **history** of DuPont's drinking water sources and the 2019 DuPont Water System Plan Update.

Groundwater rights are the source of major concerns and population viability, across America. A recent NYT investigation is an alarming view of the state of groundwater depletion in America. Why should we even consider dewatering a potential source of potable water in DuPont?

EARTH

Equally damaging, the dewatering of the Vashon Aquifer will impact the earth within a two-mile radius of the mine site. The wetlands impacted by the dewatering are surrounded by large trees: Western Red Cedars, Gary Oaks, Douglas Firs, Madronas, and other trees and shrubs. These trees and shrubs are a vital resource for wildlife. They provide the needed habitat for birds and other species. They provide shade and help purify our air. There will be devastating effects if the water that supports these trees and shrubs is removed. Our landscape will change from one that has towering trees that provide shade, a cooler climate, habitat for wildlife, and a quality of life for humans to one that becomes dry and barren over time due to the lack of groundwater.

13
EA

LACK OF ACCEPTABLE MITIGATIONS TO THE EFFECTS OF DEWATERING THE VASHON AQUIFER

The DEIS clearly states that the Vashon Aquifer dewatering is a Significant and Unavoidable Impact. It offers **NO** mitigation to replace the groundwater that provides the seeps and springs on the Sequalitchew Creek Ravine, which feed the vegetation and provides the flow of groundwater in the stream. It offers NO mitigation to replace the groundwater in our wetlands and marshes which will be reduced anywhere from 9 feet to 0.05 feet, with one wetland being eliminated. The restoration plan is not an acceptable mitigation plan as it will not prevent the loss of the hillside seeps, nor will it provide the year-round flow in the Sequalitchew Creek as is stated in the DEIS. One only needs to look at the diversion canal during the summer and fall months to see that there is no water flowing down the canal from Sequalitchew Lake. As our summers and early fall become hotter and drier, there is no surface water to divert. With the absence of the Vashon Aquifer groundwater the Sequalitchew Creek will go completely dry during the summer and fall

14
DS
Cal
EA

months. This aquifer is the only source of water during these months flowing down the creek. The aquifer seeps keep the slope vegetation healthy, nourish wildlife and provide important habitat for birds, as well as providing a local recreational treasure. With the absence of the groundwater, the temperature in the creek will rise. Groundwater is much cooler than surface water. The temperature of the surface water alone will be too high to support salmon.

14 cont.

The only mitigation offered in the DEIS is a four-step monitoring process for a clearly stated irreversible dewatering procedure. Therefore, the only mitigation offered simply aims to ensure that the already devastating and irreparable impact on our environment does not worsen. This is the definition of environmental insanity.

The city should not be beholden to a 2011 Settlement Agreement that clearly goes against state RCWs, our Comprehensive Plan and our CAO. The Sequalitchew Creek Restoration plan is a shiny, ill-conceived bauble of distraction.

I urge the city to **deny** the permit to expand the South Parcel mining for all the reasons explained above.

If you have concerns regarding the EARTH, please describe them below.

I'm not sure how you can separate the different elements of this project since they are so intertwined. i am concerned that the EARTH will dry up from lack of water which will dry up the slopes of the creek bed and adversely impact the flora and fauna of the area, not to mention the 2 mile radius of EARTH it will dry up. Although the proposal mentions this will be temporary, it will take decades to recover the lost life, both plant and animal.

1 EA Cal

If you have concerns regarding the AIR QUALITY, please describe them below.

It is all related. When loss of trees and other vegetation occurs, it decreases the carbon dioxide put back into our air. Not to mention, the air pollution we would have to deal with for the years/decades it would take for them to complete the mining process of the south parcel. The trail and the surrounding housing do not deserve to have their air quality depleted.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

The proposal seems to breeze over the impacts of dewatering the aquifer. This puts the slopes of the creek walls at risk for erosion and cracking, leading to instability. Not having the cool groundwater flowing into the creek will change water temperature and lead to changes in the ecosystem.

3 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Again, all of this is so closely intertwined. The amount of water and the temperature will change during the years/decade it takes to mine the area. This in turn will kill off the vegetation in a 2 mile radius. The proposal makes it sound like "we will put it all back when we are done," when in reality it will be too late. The damage will be done. Currently, in the north parcel where "mitigation" has been done, half the trees they replanted are brown and dying. Who is holding them responsible for putting things back like they were found on the current mine?

4 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Please see comments above.

If you have concerns regarding NOISE, please describe them below.

The trail users and residents that live near the south parcel will hear noise and mine work for years to come. The peacefulness that the trail provides will be gone. Not only will there be noise from the mine operations, but there will no longer be trees to absorb some of that noise pollution. The trail is the reason many people come to DuPont and frequent our businesses. This will drive people OUT of our town.

5 EA

If you have concerns regarding LAND USE, please describe them below.

See above

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

I have mentioned my concerns about holding CalPortland accountable for the CURRENT mining operations and their plans to mitigate the northern parcel. Until there is a 100% fool proof plan to mitigate any damage they do, the answer should be NO.

6 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

The format of this comment section almost feels like you purposely want folks to just roll over and give up. Everyone knows that you cannot separate land, air, water, flora and fauna into categories as if they are not tightly woven together. If you alter one, you alter them all. The fragile ecosystem that exists in the Sequalitchew Creek will forever be damaged if you allow this mining expansion. The current proposal breezes over the impacts like they aren't important. Please say NO to this proposal.

7 EA

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

A new concern has been brought to my attention about the now endangered gray squirrel. If we are one of the only areas where it remains, taking away a part of its habitat and also a source of its water and food supply is dangerous. I think it is important for this city to study this animal that was not endangered when the original request was made.

If you have concerns regarding the EARTH, please describe them below.

I am deeply concerned about the EARTH beyond the project's borders and the lack of a clear plan for after mining is finished. The earth along the creek will dry out, vegetation will be lost and simply replanting trees and brush afterward is insufficient. Our shaded trail could be lost, as well as the vegetation within the 2 mile mentioned area and beyond this as well. How will we cope with this added fire danger? Will CP contribute to our fire department's increase in brush fires?

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

My concerns are the same for air quality and noise. I will focus on during the mining, but what mitigations are in place to keep the noise and pollution from the nearby residents, as well as trail walkers seeking peace but hearing gravel and truck noise? Our trail currently has numerous Army units that use it for PT during the week and many hikers use it as well. What is being done to stop them from breathing in fumes, dust and dirt from the mine's work?

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

WATER is my biggest concern and includes both ground water and surface water. We are already dealing with fire danger in our area and decreasing both ground and surface water will create more prime areas for fires and less water resources to put them out. Just yesterday, July 19th there was a brush fire on our bluff that required the assistance of outside agencies and was very difficult to reach. The potential worsening of our fire danger during the hot/dry season is a true concern and a reality.

Removal of ground water extends WAY beyond the mining area and could impact the future growth on lot Y since it will decrease the potable water for our entire community. That aquifer is part of our city's drinking water and we will need it when Lot Y is developed.

3 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

WATER is my biggest concern and includes both ground water and surface water. To decrease the water in the wetlands means the loss of non-migratory animals and the loss of vegetation and trees that house many animals and insects.

The DEIS is completely incorrect when it says that removal of groundwater and surface water will not impact anything outside of the site. The impact will

4 DS

go WELL beyond the mine site itself. That is the nature of water; it provides water for vast areas and depleting the aquifer will have devastating reach, as stated (and disregarded) in the proposal. A 2 mile radius will be drier and plants and animals will die off and migrate.

4 cont

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

All of these elements are so tightly related, it is impossible to separate them into topics. To decrease the water in the wetlands means the loss of non-migratory animals and the loss of vegetation and trees that house many animals. To take down the trees and brush in the proposed area will force animals out of their current habitat. There is no realistic restoration plan that would bring back the animals, trees, vegetation, insects and bugs that make our current ecosystem survive.

5 EA

If you have concerns regarding NOISE, please describe them below.

My concerns are the same for air quality and noise. I will focus on during the mining, but what mitigations are in place to keep the noise and pollution from the nearby residents, as well as trail walkers seeking peace but hearing gravel and truck noise?

The current residents of Edmonds Village cannot leave their windows open without hearing the sounds from the Amazon warehouses: banging, beeping and noise at all hours. NO THOUGHT was put into the noise problems this would cause and I believe this proposal is guilty of the same negligent planning.

6 EA

If you have concerns regarding LAND USE, please describe them below.

The DEIS mentions there would be no "significant" alterations to land which is untrue. Perhaps no major changes on the actual mining property is true, but the surrounding lands have not been properly considered for the damage that will be done. The slopes of the trail would be dried up during a portion of the year, leaving the vegetation with no water. Why is there no plan to water these plants during the dry months?

7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

I worry that the dewatering of the aquifer will impact the beauty of both our trail and the nearby vegetation. People come from all over to enjoy our trail and to picture it brown and dry would make it much less desirable, not to mention when the trees die and there is no shade left, fewer people will come. Currently, numerous units from JBLM use the trail for morning PT and state that it is ideal because of its length, slope and shade. These folks also grab a coffee or breakfast or lunch in town, so they bring our city business as well.

The impact of decreased water will cause much of our city's vegetation to lose a water supply. Will this lead to more dead trees and vegetation within the 2 mile impacted area? And beyond? what is the plan to keep a sufficient water supply for these plants and trees? Or for replacing those that will die?

8 DS EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

I am unaware of any specific cultural resources in the project except that depleting the groundwater and leaving less water to the Sequalitchew Creek seems counterproductive to restoring the salmon to the creek. At one poijnt, this was a concern and interest of local tribes.

9 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

Has WSDOT been involved in the proposal of further mining the area? If the mine is expanded it will increase the amount of time these big, heavy trucks are on our roads, which decreases their life expectancy. Will CalPortland contribute to the repair and upkeep of the roads they use?

10 EA

If you have OTHER concerns not listed above, please describe them below.

I am very concerned that the mitigation plans focus on the actual mining area but not the vast area of impacted land around it, as stated in my comments above. The mining of the south parcel severely impacts the outlying areas of our wetlands and water supply, which in turn will decrease the necessary water for vegetation and trees, then impacting the wildlife that live in these areas.

Why is the "Restoration plan" mentioned over 200 times in the DEIS, despite the fact that it is supposed to be separate from the DEIS? And the words "human" and "hiker" are nonexistent in the considerations? Also, I do not want a Restoration Plan that has the "potential" to restore....it NEEDS to restore.

11 EA

The SEPA Handbook requires that an EIS evaluate the proposal, the no-action alternative, and other "reasonable alternatives," yet we have only been given one proposal and a no-action option. Where are the alternatives?

12 EA

I am concerned that the Restoration plan has no specific details on how the restoration will be monitored. Nor does it give sufficient details on what will be done if the restoration doesn't go as planned or add what responsibility Cal Portland has to complete the restoration within certain parameters. For example, if new trees are planted where old trees were removed or died from lack of water supply, what responsibility does CP have to maintain those trees until they are established? (A perfect example is all of the dead trees no one tended to on the corner of DS-Steilacoom Rd and Center DR.) This is a significant area of failure on other projects that have left towns high and dry after companies check the boxes of a restoration plan and leave.

13 City Cal

I highly recommend that this proposal be denied for the above stated reasons.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

This project has too many negative impacts to move forward. Sequalitchew Creek will go dry for months during the hottest months of the year and the slopes of the creek's trail will become dry as a result. The water table of West Edmond Marsh will be lowered up to 9 feet and the water tables of other wetlands reduced as well. Wetlands, aquifers, and healthy creek flows are not luxuries, they are vital. Gravel and aggregate mining is important in its own way, but not at the expense of healthy habitats and healthy communities that need to be able to cope with climate change.

If you have concerns regarding the EARTH, please describe them below.

1. Destruction of landscapes and ecosystems
2. Contamination of soil, water, and air with toxic chemicals and heavy metals
3. Displacement of communities and indigenous peoples
4. Use of large amounts of water and energy
5. Generation of large amounts of waste and tailings
6. Acid mine drainage leading to water pollution
7. Impact on wildlife and biodiversity
8. Contribution to deforestation and habitat destruction
9. Social conflicts and human rights violations
10. Long-term environmental degradation and loss of natural resources.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

1. Release of particulate matter, such as dust and ash, into the air, leading to respiratory issues for workers and nearby communities.
2. Emission of harmful gases, such as sulfur dioxide and nitrogen oxides, which contribute to air pollution and acid rain.
3. Generation of volatile organic compounds (VOCs) and hazardous air pollutants (HAPs) that can have adverse health effects on humans and wildlife.
4. Production of greenhouse gases, such as methane and carbon dioxide, which contribute to climate change and global warming.
5. Potential for accidental releases of toxic substances and gases during mining operations or transportation.
6. Impact of blasting and drilling activities on air quality through the release of dust and fumes.
7. Cumulative impacts of multiple mining operations in a region leading to degraded air quality.
8. Health risks associated with long-term exposure to air pollutants from mining activities.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

1. Contamination of groundwater with toxic chemicals and heavy metals used in mining operations.
2. Acid mine drainage, where sulfuric acid and heavy metals leach from mine waste and tailings into groundwater.
3. Disruption of natural groundwater flow patterns due to excavation and mining activities.
4. Depletion of local aquifers due to excessive water usage for mining operations.
5. Leaching of pollutants from mine waste and tailings into groundwater, affecting water quality.
6. Potential for spills or leaks of hazardous materials, such as fuels or chemicals, contaminating groundwater.

3 DS

7. Impact on nearby wells and water sources used for drinking water and irrigation.
8. Long-term degradation of groundwater quality, affecting ecosystems and human health.
9. Difficulty in remediation and cleanup of contaminated groundwater sources.
10. Potential for subsidence or land instability due to changes in water levels and underground mining activities.

3 cont

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

1. Contamination of surface water bodies, such as streams, rivers, and lakes, with toxic chemicals and heavy metals from mining activities.
2. Acid mine drainage, where sulfuric acid and heavy metals leach from mine waste and tailings into surface water, leading to water pollution and ecosystem degradation.
3. Sedimentation and erosion of soil from mining operations, impacting water quality and aquatic habitats.
4. Disruption of natural water flow patterns and hydrology due to mining activities.
5. Alteration of stream channels and wetlands, affecting aquatic biodiversity and ecosystem functions.
6. Reduction of water availability and quality for downstream communities and ecosystems.
7. Impact on aquatic life, including fish and other species, due to changes in water quality and habitat destruction.
8. Potential for spills or leaks of hazardous materials, such as fuels or chemicals, contaminating surface water bodies.
9. Difficulty in restoring and mitigating the impacts of mining on surface water and wetland ecosystems.
10. Cumulative impacts of multiple mining operations in a region leading to widespread degradation of surface water resources.

4 DS

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

1. Destruction of habitats and ecosystems essential for fish, plants, and animals due to mining activities.
2. Disruption of migration routes and breeding grounds for fish and wildlife.
3. Contamination of water bodies with toxic chemicals and heavy metals, impacting aquatic life and plant species.
4. Loss of biodiversity and extinction risk for native species in mined areas.
5. Disturbance and displacement of wildlife populations due to noise, vibrations, and habitat destruction.
6. Acid mine drainage affecting aquatic life and plant species in streams and wetlands.
7. Changes in soil and water quality affecting plant communities and vegetation cover in mined areas.
8. Introduction of invasive species due to disturbances caused by mining activities.
9. Impact on endangered or vulnerable species that rely on the ecosystems affected by mining.
10. Long-term ecological damage and challenges in habitat restoration and conservation efforts in mined areas.

5 EA

If you have concerns regarding NOISE, please describe them below.

1. Disruption of wildlife behavior and communication due to loud noise from mining operations.
2. Negative impacts on sensitive species, such as birds and mammals, that rely on sound for navigation and survival.
3. Disturbance of breeding, nesting, and feeding activities of wildlife near mining sites.
4. Health impacts on humans living near mining operations, including stress, sleep disturbances, and hearing damage.
5. Interference with outdoor recreational activities in the vicinity of mining sites.
6. Disruption of natural soundscape and tranquility in the surrounding environment.
7. Cumulative effects of noise pollution from multiple mining operations in a region.
8. Challenges in mitigating and controlling noise levels from mining activities.
9. Potential conflicts with local communities and stakeholders due to noise pollution.
10. Need for noise monitoring and management plans to minimize impacts on both wildlife and human populations.

6 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

I strongly oppose the the proposed CalPortland South Parcel mine expansion which would dewater the Vashon Aquifer. Dewatering the aquifer would cause a significant drop in the groundwater level in multiple wetlands and two lakes and negatively impact the environment of DuPont. The elimination of the Kettle Wetland and the drying up of seeps and springs feeding Sequalitchew Creek would cause it to dry up for half the year, and surrounding hillside vegetation would subsequently also dry up. The creek and greenery are a major aspect of the enjoyment of the Sequalichew Creek Trail which is enjoyed by both local citizens and out of town visitors.

In summary, the drop in groundwater level throughout the area caused by the mine expansion would negatively impact our wetlands, creek, vegetation, and wildlife - all the things we value about the currently beautiful environment of DuPont. None of these should be sacrificed to benefit private industry!

If you have concerns regarding the EARTH, please describe them below.

I moved to this town 24 years ago, mainly because of the trails, parks, and natural beauty. The earth here has a long history of tainted soil, and has managed to overcome this through remediation and planning. I do not want this to change in any way. The citizens here should be the biggest consideration here, not industry.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

The aquifer would be changed for the worse, affecting humans and animals alike, both more important than industrial profits.

2 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

All of this would be negatively impacted by allowing the proposed changes to our town. The streams and wetlands are an integral component to our enjoyment of it, and should not be allowed to change.

3 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

I am concerned for all of the lives our town sustains, animals, fish and vegetation. This is their home and ours, and nothing must be allowed to interfere with any of it.

4 EA

If you have concerns regarding NOISE, please describe them below.

I lived in Edmond Village at one point, and the noise of the machines, drilling and such was very disturbing to my sleep and quiet enjoyment of my property. We don't need or want this noise.

5 EA

If you have concerns regarding LAND USE, please describe them below.

The proposed project would be too close to many households and trails, changing the nature of both.

6 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

I don't want the landscape of the town to change for the worse, negatively impacting property values.

7 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

The wildlife, streams and fish are important to the culture of Native Americans living around here. This would be negatively impacted if the project is allowed to go forward.

8 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

In recent memory, there was a shortage of water. This led the City of DuPont to decide to not water the trees in the median strip of Center Drive. This caused the loss of many trees. There were water restrictions in place. This occured before the average DuPont resident felt any effects of Climate Change. This past winter was decidedly different in the amount of rainfall and snowpack. As the effects of Climate Change continue we need to maintain all avenues to obtain water for the population of DuPont. Also the population of DuPont will be increasing due to the new housing regulation. I object to any business requesting to use more water at the expense of the residents of DuPont.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Please don't allow this. Our water is too precious to waste. Future potential need of the drinking water should be protected.

1 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

The stream will dry up for months during the hottest time of the year. Protect our wetlands and the water table that feeds them.

2 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you drain the aquifer the Sequalitchew Creek will dry up for months every year. The native flora watered by the seeps on the creek slopes will die and possibly never return.

3 DS EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

Please do not allow the project. The S Creek trail is one that my family uses each time they come to visit me here in DuPont. It's where we take folks visiting from out of town so they can discover the beauty of the Pacific Northwest without having to drive far.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Our very existence in DuPont is in danger due to the proposals to dig new wells. We need the aquifer to remain intact, not destroyed. . Our abundant natural resources will be depleted, impacting our citizens' quality of life as well as killing many animals living on our land.

1 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

We depend on the streams, surface water and wetlands to keep our forests alive. Our forests will be devastated if the plans to develop the land are allowed.

2 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

We cannot allow the many species of animals inhabiting the proposed development to be destroyed. They cannot survive the planned extensive invasion of their environment.

3 EA

If you have concerns regarding NOISE, please describe them below.

The natural area located in the proposed area is a buffer from noise for all of us living in DuPont. Please let's keep DuPont free from this destruction to our world.

4 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

As a senior citizen and a 17 year resident of our beautiful little town, I am concerned about every aspect of this project negatively impacting our lives.My greatest fear is the loss of our abundant natural resources but I also worry my property value
will go down. As an 80 year old, I can ill afford a loss of value due to this invasive project.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

We are retired military who frequent DuPont for its businesses and recreational areas. I use this trail regularly and its unique attributes include that it's watered. This riparian area thrives and stays cool during the summer when everything dries out. Keeping it watered is critical to the ecosystem and wetlands it feeds.

What's at Stake if the Vashon Aquifer is Dewatered?

· Sequalitchew Creek will go dry for approximately five months each year during the hottest part of the year.

· The slopes of our beloved Sequalitchew Creek Trail will go dry and vegetation will die as the seeps will be eliminated. The seeps maintain the lush riparian environment and make up the creek flow

· The water table of West Edmond Marsh will be lowered up to 9 feet. Other wetlands in DuPont will be lowered up to two feet

· The City of DuPont has used the Vashon Aquifer as potable drinking water in the past and still has a water right to the aquifer it wants to keep for future growth

Please do not allow the dewatering of this rare and valued gem in DuPont.

If you have concerns regarding the EARTH, please describe them below.
The natural one i. DuPont is limited and one of the reasons i chose to live here. Further expansion of digging and blasting will significantly reduce that natural land

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.
Reducing the number of trees affects air quality and habitat

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
The groundwater in Sequalitchew is vital to the vegetation and ecosystem. It will be severely impacted by the expansion

3 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
See above regarding groundwater, it applies as well to wetlands

4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
See above regarding groundwater

5 EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.
Our land would be better served for to maintain barriers to places like CalPortland instead of making them your backyard view

6 EA

If you have concerns regarding the EARTH, please describe them below.

I am concerned about sinkholes, and the destruction of beautiful DuPont trails related to mining.

1 Cal

If you have concerns regarding the AIR QUALITY, please describe them below.

Mining activities will affect the air quality in DuPont city due to machinery which creates polution.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

I am not an expert in wanterways and aquifers, but there is a possibility of mining activities destroying the aquifer. This will directly affect me and my household since we have a well on the property. If the public water will become unavailable, we will not be able to utilize the well.

3 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Mining activities will negatively affect Sequalitchew creek which feeds directly into the Puget Sounds. The wetlands are breeding grounds for many species of animals and birds. Mining will disturb the wetlands and cause birds to migrate to different areas.

4 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

The same comment as above: mining activities will disturb nature, animals and birds' habitats, and drain toxic waste to the Sound which in turn will affect fish population and their breeding patterns.

5 DS EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

Instead of expanding the mine, this land could be used to build a nature park or a water park. There are so many different way to use this land other than destroying the environment by mining expansion.

6 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

The same as above. What's the beauty in mining? Why can't the state and city collaborate in building a park, a fishing pier, and more?

7 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

Expansion of mining activities will lead to more trucks and other machinery coming through DuPont creating even more traffic. At this time, not only I5 is jammed back-to-back, but even the scenic route through Steailcoom is taking over 30 min to get through Steilacoom-Dupont road.

8 EA

If you have OTHER concerns not listed above, please describe them below.

I want to see how the mine is currently compliant with regulations.

9 EA City

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

RECEIVED
JUL 2 2024
CITY OF DUPONT

To: City of Dupont

From: Kathy Preston

1907 Braget St.

DuPont, WA 98327

I am concerned about the request that is before the city from the local gravel mine company. From what I have read, the dewatering of the Vashon Aquifer in order to mine gravel would be devastating for our local environment. It would impact Sequalitchew Creek, the Sequalitchew Creet Trail's slopes, Edmond March and potentially compromise the source of potable drinking water. Our Comprehensive Plan and the CAO both have language that should deny a permit to expand the mining into the South Parcel. We could see vegetation stress, soil erosion, cracking and compacting of soil that protects plants and structures, and loss of habitat for animals and insects that rely on the wet environment. DuPont still has water rights issued in 1948 to the Vashon Aquifer. In the past the city has used that aquifer for drinking water and needs to keep that water available.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

I am concerned about air quality in DuPont as the mine expands, particularly near Creekside Apartments. 1 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

I am very concerned about any lowering of groundwater in and around Sequalitchew Creek and of any of DuPont's aquifers. Climate change means hotter, dryer weather for DuPont . Groundwater/aquifer recharge will be more difficult and expansion of the mine will lower the water available. 2 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

My understanding is that 4 months of the year Sequalitchew Creek will be dry if the mine is expanded. This would have significant impact on the riparian environment of the creek and its surrounding ecosystem. 3 DS

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

As stated above, the entire ecosystem of Sequalitchew Creek would be impacted due to the de watering of the stream for gravel mining. The ecosystem is currently one of lush vegetation with heavy fern growth and shade. If you walk the trail, you hear birds and can see frequent garter snakes, frogs and squirrels.Their habitat will be greatly altered if not destroyed when de-watering occurs. 4 EA

If you have concerns regarding NOISE, please describe them below.

I am concerned about noise from the gravel mine operation as it comes closer to residential and recreational areas of DuPont, in particular Creekside Apartments, the Home Course and the DuPont Community Garden. 5 EA

If you have concerns regarding LAND USE, please describe them below.

Current mining land use should not be expanded in the direction of sensitive environmental areas like the Sequalitchew Creek. 6 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

The Sequalitchew Creek trail is an important environmental and visual asset for the City of DuPont. Residents (and non-residents) enjoy this recreational resource on a daily basis. It provides a natural respite from the built world and is irreplaceable.

7
EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

The Sequalitchew Trail borders sensitive Native American sites and therefore any environmental damage to the creek should take this into consideration.

8
EA

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

I frequently walk the Sequalitchew Creek Trail as do hundreds if not thousands of others. I've been there at all times and days throughout the seasons and find plenty of other folks are too. Even in the hottest days of summer it is cool and damp. Water runs across the trail and down the stream when it hasn't rained for days and the creek is dry upstream. I understand this is because of the multiple seeps from the underlying aquifer. That is what makes this little canyon unique. Surely this is why this canyon was used for the winter home of the people for centuries. Here at the heart of the earliest industrialization in the area, this little canyon has been set aside, replanted with native plants, and historical sites identified. It is the jewel of DuPont's trail system. Destroying the aquifer cannot be undone. Why would the city council even consider this option? Surely there is no shortage of gravel in Western Wa. Whatever financial gains will be short lived but this unique canyon will be forever lost. This trail serves children and grandparents, students, soldiers and businessmen. It is a tiny remnant of the old world right in the heart of town. It is up to people like our councilmen to save a tiny scrap of the world for future generations, and besides, where else can a kid see salamanders around here anymore?

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Projected permanent drop in groundwater in Edmunds Marsh, Pond Lake, Old Fort Lake, and other wetlands around DuPont is alarming, raises concerns about future availability for human use, especially given planned population increases and density requirements.

1 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Lower water table and loss of wetlands affects streams and surface water, raising even greater concerns about increasing draught and fire danger due to even drier vegetation.

2 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Of course loss of wetlands and groundwater adversely affects fish and wildlife.

3 EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

Proposed plan appears to violate city ordinance. Given the DEIS study results I fail to see why this plan is still being considered. The fact that it is suggests the study and public comments are an irresponsible exercise in box checking, not serious due diligence.

4 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

RE: Comments on Draft Environmental Impact Statement (DEIS) for Gravel Mining Proposal - Pioneer Aggregates South Parcel Project

To Whom It May Concern:

I have the following comments regarding the above. My comments not only cover the DEIS but touch on related, accessory documents provided during the scoping phase necessary to interpret elements of the DEIS where I found the latter was unclear or incomplete.

My comments generally cover hydrological impacts and related issues (e.g., wetland plants). Some of the two most concerning impacts from the mining expansion are effects to Sequalitchew Creek and the existing, unnamed kettle wetland. But there are some general concerns about the hydrological modeling underpinning the overall project and wider impacts outside the project area that should also be addressed.

1. Impacts to Sequalitchew Creek

The DEIS makes frequent reference to the Sequalitchew Creek Restoration Plan (SCRP). It describes this plan as a separate and somewhat related action. It implies that funding for this plan is dependent in whole or in part on the Applicant and notes that "… the 2011 Settlement Agreement indicates that any approval for mining under the Pioneer Aggregates South Parcel Project shall not be effective until permits and approvals needed for implementation of the Sequalitchew Creek Restoration Plan developed by CalPortland and the Environmental Caucus are in place." (p. 3.5-10).

For example, the relationship between the Applicant's DEIS and the SCRP is highlighted on p. 29 of Appendix B, South Parcel Monitoring Plan:

> "Mining of the South Parcel and the restoration of Sequalitchew Creek are separate, but interacting, projects. Each project has its own adaptive management process tailored to achieving the goals and objectives of that project. The interaction between the two adaptive management processes is three-fold: 1) project schedules that encourage restoration in advance of the potential impacts from mining; 2) development of performance thresholds for mining that support restoration based on prior technical studies, including the cumulative effects analysis prepared in 2016 (Aspect and Anchor, 2016); and 3) coordinated monitoring and open sharing of information."

1 DS Cal

Because the SCRP figures so prominently in the DEIS, in addition to the fact that the Applicant's project is contingent on this plan, this plan or a good summary of it should have been included as an Appendix in the DEIS so that everyone understands what it is expected to accomplish and how.

This seems to be a critical omission. The fact that the SCRP wasn't included even partially calls into question the completeness of the DEIS.

The project intends to direct intercepted groundwater from the mining northward away from the upper portion of the creek's ravine and eventually to the so-called wetland mitigation area further downstream via a circuitous route[1]. Moreover, the project will ultimately leave the property adjacent to the north side of the creek with a deep and steep-sided cut devoid of groundwater bearing gravels. There are a number existing springs or seeps in the north side of the creek's deeply incised ravine channel that are likely to be threatened if groundwater in this area is diminished.

2 DS Cal

The Applicant declares at the outset that it has estimated up to 79% of the groundwater flows to Sequalitchew Creek would be lost under the proposal (p. 1-5). In addition, the Applicant acknowledges that "… during dry summers (when Sequalitchew Springs discharge to Sequalitchew Lake is fully consumed by JBLM), no surface water outflow from Sequalitchew Lake to East Edmond Marsh and Sequalitchew Creek would occur. Lower reaches of Sequalitchew Creek would be dry (pp. 1-6, 1-7). Moreover, the SCRP would have no effect on the ravine spring flows (p. 79, Appendix B, Earth and Water Resources Report).

So, understanding whether the SCRP is a viable mitigation measure for this project is key to evaluating the DEIS. Yet this component project appears to be missing from the DEIS.

3 DS Cal

This area, the ravine, has diverse conditions and thus harbors a diverse flora (with at least one relatively rare, state-sensitive species) and will clearly be impacted by the project. Sequalitchew Creek has already been drastically impacted by excessive groundwater withdrawals upstream in connection with JBLM's water system near Sequalitchew Springs and any summertime flow now is a function of available groundwater. This is a case where a project will have long-term impacts beyond its boundaries and these impacts need to be scrutinized carefully in the DEIS. I suggest the DEIS needs to focus on quantitative measures (estimates) of groundwater impacts to the springs and seeps contributing to creek flow in contrast to the predicted flows from the SCRP, including the reliability of such groundwater predictions in the face of climate change.

4 DS Cal

Unfortunately, I do not see a catalog of the plants and animals in the Sequalichew Creek ravine that will also be affected by water loss, hence the impacts to this area outside the project area boundaries are unknown or at least undocumented in the DEIS. For example, I noted that existence of one state-sensitive vascular plant species in this area (I have a somewhat recent photo of the plant). It is not my place to reveal the name and/or location of the plant and it's the Applicant's responsibility to contact the Department of Natural Resources Natural Heritage Program and find out the protocol for handling this issue for their project.[2] I have a list of other plant species in the ravine area that will likely be affected by the project, yet I don't see anything comparable in the DEIS.

5 Cal EA

The Applicant asserts (p. 3.6-19) that the SCRP

> "…has the potential to restore an annual average of 12.9 cfs to a 1,200-foot reach of Sequalitchew Creek that currently experiences little to no consistent flow. Seasonally, the flows in this reach following restoration are predicted to be between 2.5- cfs in August up to just over 26 cfs in March. Flows of this magnitude would reestablish a functioning stream in the now frequently dry channel,

6 DS

[1] Sheet C1 in "05-07-2021 South Parcel Project Plans_22x34_FLATTENED.pdf" from the Scoping Phase.
[2] DNR Natural Heritage Program at https://www.dnr.wa.gov/natural-heritage-program; the vascular plant in question is listed on the 2021 WA Vascular Plant Species of Conservation Concern List at https://www.dnr.wa.gov/NHPlists.

> providing new aquatic and riparian habitat and a connection between the Sequalitchew Creek ravine and the marshes." (underline added)

6 cont

But as noted previously (pp. 1-6, 1-7 in the DEIS), the creek still could be dry in some years despite the SCRP. The implication is that ravine habitat outside the project area is likely to change and become drier and less habitable for riparian vegetation.

As it stands now, and into the future, JBLM controls most of the water available that could replenish Sequalitchew Creek flows under any restoration, and this control is outside the State's regulatory framework; for example, on p. 34 of Appendix B, Earth and Water Resources Report the DEIS states:

> "... JBLM's legal access to water is embedded in the base's federal status as a military base, as such it is allowed to access water for the base's primary purposes which includes the drinking water system that serves its population. Sequalitchew Springs generally provides more flow that needed by JBLM for water supply." (underline added)

7 DS Cal

So, it's imperative that the Applicant explain precisely what objectives the SCRP is expected to achieve, what is the timeline for the SCRP, and how they will the objectives be attained given these jurisdictional discontinuities.

2. Impacts to the Kettle Wetland and other surface waters

The project intends to destroy the existing kettle wetland on the site and attempt replace it with a wetland mitigation site on already mined ground. The existing small wetland was likely formed around a glacial ice block that left fine materials of low permeability when it melted. The current area consists of black peat soils over a layer of lower permeability silty clay. It also apparently has some of the vegetation one might expect of a such a wetland[3]. The water table in its vicinity also exhibits smaller fluctuations in contrast to the much larger fluctuations on the rest of the site[4].

8 EA

In addition to the so-called Kettle Wetland, it is noted on p. 1-26 that:

> " … water levels in isolated lakes and kettle wetlands not directly connected by surface water to the Sequalitchew Creek system would be lowered due to lowered groundwater levels from the Proposed Action. The anticipated decrease in water levels would be approximately 3 ft for Wetland 1D; 2 ft for Pond Lake; 1 ft for Wetlands, #8, #9, #10, and #11; and 0.5 ft for Old Fort Lake. Implementation of the Restoration Plan would likely not mitigate these impacts. These isolated wetlands have significant seasonal variability in water levels and are often dry during the summer. For these reasons, changes that result from changes in groundwater level may be difficult to observe." (underline added)

9 Cal EA

These are adverse impacts outside the project boundaries that are unmitigated. The condition of these wetlands will likely be exacerbated by the effects of climate change and reduced rainfall. The DEIS need to acknowledge that the Applicant's project will compound these adverse conditions.

It appears that some results of vegetation sampling in and around the Kettle Wetland are included in the DEIS (Appendix B within Appendix J, Floodplain Habitat Assessment and Mitigation Report and pp.

10 Cal EA

[3] Page 5, Section 2.3 in March 2021 Wetland Mitigation Plan.
[4] Page 8, Section 4 in Groundwater Model Update-DuPont Mine South Parcel Expansion Area.

14-15 of the same report). This material is somewhat scattered and should be consolidated into a single table for just the Kettle Wetland for ultimate comparison with the results of the Applicant's proposed mitigation site plan. The Applicant has indicated their mitigation site will be re-vegetated in part using specimens from the Kettle Wetland, and partly from general sources in the Puget Sound region[5]. The scope of the original vegetation sampling is not clear, however, and it seems to be restricted to two (2) fairly small areas at the north and south ends of the wetland[6]. A key question the DEIS does not ask or answer is: how representative is this sampling and will it suffice in replicating the plant community of the original Kettle Wetland?

10 cont

The Applicant has indicated it will attempt to salvage the soils of the Kettle Wetland and re-use them in constructing a mitigation wetland site[7].

The Applicant's Wetland Mitigation Plan from 2021 hints that failure is a possibility, or at least such mitigation may not go according to plan, as it includes a section titled "Adaptive Management and Contingency Plan"[8]. The DEIS should mention and give a reference to these contingencies.

Perhaps more important is the timeline for how long the wetland mitigation is expected to take. The Credits and Debits document[9] cited in the mitigation plan notes that there are temporal losses due to delay of mitigation (see the section on Temporal Loss Factors in that document), and on p. 16 note that:

> "… if a mitigation project is delayed, and impacts are incurred before a mitigation project is installed, there is an increase in the temporal losses. Thus, the temporal loss factor is increased for projects that are delayed."

11 Cal EA

The DEIS should provide a summary of the mitigation timeline, i.e., the interval between wetland destruction and mitigation planting, not just the monitoring timeline noted in the Monitoring Plan section of the Applicant's Wetland Mitigation Plan.

Another practical question concerns how the Applicant will manage the process to keep the mitigation site from being overrun by deleterious invasive plants (Himalayan blackberry, yellow flag iris, Scotch broom, etc.) in the long term.

12 Cal EA

Finally, I note that after mining, the site landscape east and upgradient of the wetland mitigation site is zoned for residential, manufacturing, industrial, etc., and apparently, this intent is also contained in the reclamation correspondence with DNR[10]. So, a very large portion of the mining site will ultimately be covered with asphalt and similar hard or impervious surfaces (roads, residential roofs, warehouses, and commercial buildings) with all that implies for both water quality and water quantity. Such artificial surfaces are extremely deleterious to natural waters. I think the DEIS needs to spell out how the mitigation wetland will be maintained over the long term in the face of this development, not just during the gravel mining phase.

[10] For example, Figure 3 in Landmark Tree Inventory Report and Subsequent Use section on page 2 of the Reclamation Narrative Letter to DNR from the Scoping Phase.

3. Hydrological Modeling Predictions

The Applicant used groundwater modeling with the goal of predicting impacts from dewatering and gravel mining[11]:

> " … This report documents the updated analysis used to predict groundwater levels during and after the proposed dewatering and mining of the South Parcel at CalPortland's Pioneer Aggregate facility in DuPont, Washington." (underline added)

The Applicant used proprietary software[12] in conjunction with data collected locally to develop the model. While the Applicant considered some modeling uncertainties,[13] I didn't find mention of climate change effects that might overshadow these hydrological analyses. For example, the modelers note that[14]:

> "… For the purposes of this modeling effort, we assumed surface water levels in the wetlands will be similar to historical conditions".

14 DS Cal

This may be a flawed assumption and not taking into account climate change impacts on groundwater could make predicted outcomes unrealistic. For example, Johnson et. al. (2011)[15] in their numerical simulations of groundwater flow in the nearby Chambers-Clover watershed attempted to account for climate change affects by considering a 20% reduction in rainfall with its resultant effects on surface waters. The modelers for the proposed project could certainly carry out a similar exercise, or possibly even consider time varying changes (e.g., simultaneously reducing rainfall amounts while altering the distribution of rainfall within a year). This would allow decision makers to see a broader range of potential water-related outcomes.

Thank you for the opportunity to comment.

Sincerely,

Kurt Reidinger

If you have concerns regarding the EARTH, please describe them below.

I am writing this today to request you please consider to NOT allow the mining and ruining of Sequalitchew Trail. The wetlands in DuPont are known to have a positive effect on water quality downstream and in aquifers by removing pollutants through the processes of sediment trapping, nutrient removal, and chemical detoxification. Wetlands also regulate the flow, retention, and release of stormwater to surface and groundwater systems. CalPortland's request to dewater the Vashon Aquifer will destroy our wetlands, marshes, creek, and surrounding environment. In their proposal, it clearly states:

- West Edmonds Marsh groundwater level will decrease by 9 feet
- Pond Lake water level will be reduced by 2 feet
- Wetlands number 8, 9, and 10 water levels will be reduced by 1 foot
- Old Fort Lake will be reduced by 0.05 feet
- The Kettle Wetland will be eliminated
- The seeps and springs that feed Sequalitchew Creek will dry up

These groundwater levels will be reduced forever! The decrease in groundwater will lead to the loss of vegetation, loss of stream flow, loss of habitat, decreased ability to remove pollutants, and will add drought-like conditions to the Sequalitchew Creek Ravine.

ALL of this will be detrimental to the wellbeing of the wildlife and beauty know in DuPont. This will preclude future generations of enjoying the natural wildlife and habitats in DuPont.

One of the main reasons why our family chooses to reside in DuPont is so that we may enjoy the wildlife, trails, especially the Sequalitchew trail, and nature-esque atmosphere in DuPont.

To say yes to the mining is to say no to the wildlife, beauty, and nature that is DuPont.

The mining is detrimental to the environment, air quality, aquifer, wetlands, fish, plants, and wildlife, that all DuPont residents love and enjoy.

ALL DuPont residents will be affected with this decision so therefore I request you to consider a resounding NO to the mining which will ultimately result in a reduced quality of life for residents, and all living things— trees, plants, flowers, deers, sea lions, frogs, bunnies, and all creatures big and small.

These groundwater levels will be reduced forever! The decrease in groundwater will lead to the loss of vegetation, loss of stream flow, loss of habitat, decreased ability to remove pollutants, and will add drought-like conditions to the Sequalitchew Creek Ravine.
ALL of this will be detrimental to the wellbeing of the wildlife and beauty know in DuPont. This will preclude future generations of enjoying the natural wildlife and habitats in DuPont.
One of the main reasons why our family chooses to reside in DuPont is so that we may enjoy the wildlife, trails, especially the Sequalitchew trail, and nature-esque atmosphere in DuPont.
To say yes to the mining is to say no to the wildlife, beauty, and nature that is DuPont.
The mining is detrimental to the environment, air quality, aquifer, wetlands, fish, plants, and wildlife, that all DuPont residents love and enjoy.
ALL DuPont residents will be affected with this decision so therefore I request you to consider a resounding NO to the mining which will ultimately result in a reduced quality of life for residents, and all living things— trees, plants, flowers, deers, sea lions, frogs, bunnies, and all creatures big and small.

If you have concerns regarding NOISE, please describe them below.

I am writing this today to request you please consider to NOT allow the mining and ruining of Sequalitchew Trail.

The noise from the mining will not only disturb the residents but also the wildlife! The wildlife will be scared and injured due to this noise and disruption.

The wetlands in DuPont are known to have a positive effect on water quality downstream and in aquifers by removing pollutants through the processes of sediment trapping, nutrient removal, and chemical detoxification. Wetlands also regulate the flow, retention, and release of stormwater to surface and groundwater systems.
CalPortland's request to dewater the Vashon Aquifer will destroy our wetlands, marshes, creek, and surrounding environment. In their proposal, it clearly states:
• West Edmonds Marsh groundwater level will decrease by 9 feet
• Pond Lake water level will be reduced by 2 feet
• Wetlands number 8, 9, and 10 water levels will be reduced by 1 foot
• Old Fort Lake will be reduced by 0.05 feet
• The Kettle Wetland will be eliminated
• The seeps and springs that feed Sequalitchew Creek will dry up
These groundwater levels will be reduced forever! The decrease in groundwater will lead to the loss of vegetation, loss of stream flow, loss of habitat, decreased ability to remove pollutants, and will add drought-like conditions to the Sequalitchew Creek Ravine.
ALL of this will be detrimental to the wellbeing of the wildlife and beauty know in DuPont. This will preclude future generations of enjoying the natural wildlife and habitats in DuPont.

ALL DuPont residents will be affected with this decision so therefore I request you to consider a resounding NO to the mining which will ultimately result in a reduced quality of life for residents, and all living things— trees, plants, flowers, deers, sea lions, frogs, bunnies, and all creatures big and small.

The aesthetics and visual of Sequalitchew trail will be ruined with the mining due to the loss of water. It will lack the life and greenery well loved and enjoyed by all residents! This will depreciate the value and experience of the area. It will cause unnecessary death and drying bringing a sadness to the area especially to those who knew the trail before the damage.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding the EARTH, please describe them below.

I am concerned about the sequalitchew trail. My family including my kids, my husband, our dog, and I walk this trail all the time. We love the sequalitchew trail or as my daughter would call it the “walk to the water” and don’t want it to be affected by any man decided drilling/mining/corrupting/etc.,
We do not want to see the trail altered or damaged at all. Removing the water would ruin this trail and the experience of walking through nature to get to the water. The sound of the water on the walk, the green plants and trees, the wildlife all make the sequalitchew trail beautiful. Please do not lessen the quality of life that is the walk to the water. The peace with nature that is found on the walk to the water is not available anywhere else in DuPont. The families that utilize the trail, just like mine, are depending upon you to not do anything that would affect this beautiful piece of DuPont and one of our favorite DuPont traditions!
We enjoy the wildlife, the greenery, the life, the sounds, and the overall experience of the sequalitchew trail. Please do not ruin it.

If you have concerns regarding the EARTH, please describe them below.
I grew up biking and running on sequalitchew and the marshes around DuPont. It would be extremely disappointing and painful to see the DuPont that raised me be slowly destroyed by this awful proposal.

If you have concerns regarding the EARTH, please describe them below.

What you are planning to do will ruin the environment for the animals that live there when there isn't much left already, it will also disturb the neighborhoods and bring in too much traffic. The beauty of the wetlands is that it's quiet and is a protected reserve. Please do not do this.

If you have OTHER concerns not listed above, please describe them below.

What you are planning to do will ruin the environment for the animals that live there when there isn't much left already, it will also disturb the neighborhoods and bring in too much traffic. The beauty of the wetlands is that it's quiet and is a protected reserve. Please do not do this.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

It is important for the soil in this region to retain a healthy aquifer. Damage or depletion of the aquifer will negatively affect the health of the soil resulting in damage to the flora and fauna in the area.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Ground water and a healthy aquifer are important to the total health of an ecosystem. I am worried that the depletion of the auqifer will negatively impact the surrounding wildlife and flora.

2 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Without a healthy auqifer, water sources are more likely to dry out. This negatively impacts all wildlife and flora. This also decreases the beauty of the area, negatively impacting outside experiences.

3 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Fish, plants, and animals all rely heavily on an ecosystem that is supported by a healthy level of ground water. The depletion of this aquifer will negatively impact all the fish, plants, and animals living within this ecosystem.

4 EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

This land should be used for recreational purposes. I do not believe this land should be used to increase production for a gravel mine. I believe the land is more valuable as a healthy example of family friendly outdoor recreation in Washington.

5 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

The depletion of this aquifer are will result in ecosystem death. That will negatively impact the aesthetics of the area. Plants and animals will disappear.

6 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

As a citizen of Dupont and an avid user of this area, I am concerned with the lack of accessibility to such a wonderful recreation area. I am concerned for the health of the surrounding ecosystem if this project is to be completed. This area is an important source for the local community to spend time outside in the beautiful nature of Washington.

7 EA

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

Attention: Barb Kinkaid

My comments regarding the City of DuPont's Pioneer Aggregates South Parcel Project - Draft EIS begin on the next page. Below are some prefacing remarks.

In 2011 CalPortland made it clear to the City of DuPont Mayor and Council members and to members of the Environmental Caucus (led by the Nisqually Delta Association) that **to avoid protracted litigation** a new conditional use permit would have to be issued to enable it to access Vashon aquifer saturated gravel located beneath the South Parcel under dry mining conditions.

What ensued was the 2011 Settlement Agreement whose provisions satisfied CalPortland in this regard. As mitigation for the adverse environmental impact of its proposed aquifer dewatering scheme CalPortland agreed to provide funding for development of a South Puget Sound Salmon Enhancement Group Sequalitchew Creek Restoration Plan.

The 2011 Settlement Agreement stipulated that such a Plan must incorporate **five essential elements**. In 2012, I pointed out that such a Plan would not be based upon a credible description of the hydrology of the area and, further, that if such a Plan was developed and implemented that it would not provide the mitigation described. 1 City DS Cal

I refer to the Sequalitchew Creek Restoration Plan's deficiencies in my following Pioneer Aggregates South Parcel Project - Draft EIS comments. I have also provided copies of my 2012 and 2020 advice to all parties' signatory to the 2011 Settlement Agreement for reference.

I have also provided a detailed Sequalitchew Creek Restoration Plan that I previously submitted to all parties' signatory to the 2011 Settlement Agreement. That Plan is based upon a proper understanding of the natural hydrology of the Sequalitchew Creek watershed. It eliminates the adverse effect that dewatering would have on the Sequalitchew Creek/Edmond Marsh watershed.

It is my view that since CalPortland has threatened **protracted litigation** if it is not issued a conditional use permit to mine Vashon aquifer saturate gravel in the South Parcel under dry mining conditions, it is unlikely that it will agree to support DuPont's No Action Scenario A or B options. 2 City DS Cal

A collaboratively developed CalPortland/City of DuPont Sequalitchew Creek Restoration Scenario Option may provide an off ramp necessary to avoid **protracted litigation** of this issue.

Thank you for the opportunity to comment,

Don Russell

(253) 534-5342 krdr1@juno.com

Dear Ms. Kinkaid,

My comments on the Pioneer Aggregates South Parcel Project – EIS are contained below.

As a witness

I have witnessed the adverse environmental impacts of the major hydromodification projects executed in the American Lake-Sequalitchew Lake-Sequalitchew Creek subwatershed of the Chambers-Clover Creek Watershed (WRIA 12) for the past 76 years. I am now 94 years old.

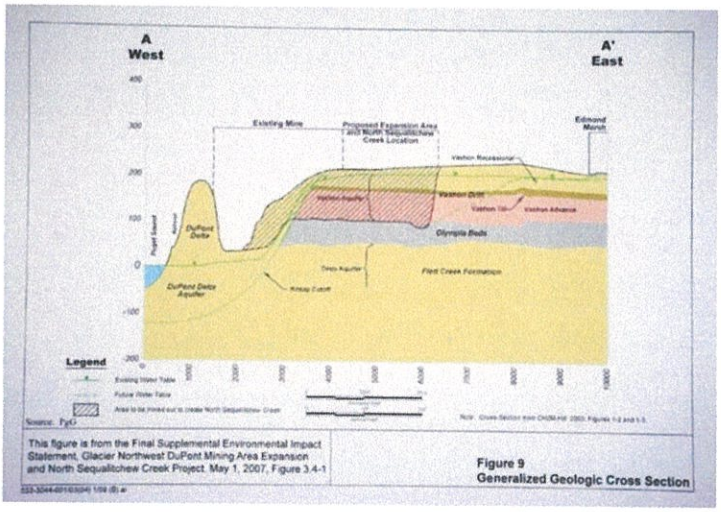
As a retired citizen volunteer and long-standing active member of the Chambers-Clover Watershed Council, I have conducted environmental impact surveys and water quality monitoring in this subwatershed for the past 25 years. For the past 15 years, I have been sending copies if my reports and commentary on CalPortland's quest, as defined in this DEIS, to secure a conditional use permit for expansion of its mining operations in the South Parcel to Ecology, DNR, DuPont City Council members, members of the Environmental Caucus, and CalPortland representative and their consultants.

3
EA

With this brief introduction I have the following comments about various aspects of the Pioneer Aggregates South Parcel Project Draft EIS. These aspects include; the adverse ecological impact of issuing a conditional use permit allowing CalPortland to dewater the Vashon aquifer to mine dry gravel contained in the South Parcel; the validity of the Sequalitchew Creek Restoration Plan; No Action Scenario A – Continuation of Existing Conditions; No Action Scenario B – Site Development Under Existing Zoning; and conclude by offering a proposed, collaboratively developed, CalPortland/City of DuPont Sequalitchew Creek Restoration Scenario that would involve upgradient groundwater discharge interception in a constructed and maintained upper flowing reach of Sequalitchew Creek and associated Edmond Marsh wetland.

4
EA

The adverse ecological impact of issuing a condition use permit allowing CalPortland to dewater the Vashon aquifer



The above illustration shows a cross section of the hydrogeology of the area. The green line with inverted pyramids shows the existing Vashon aquifer groundwater level. The green dotted line shows the Vashon aquifer groundwater level during and after CalPortland's dewatering of the area.

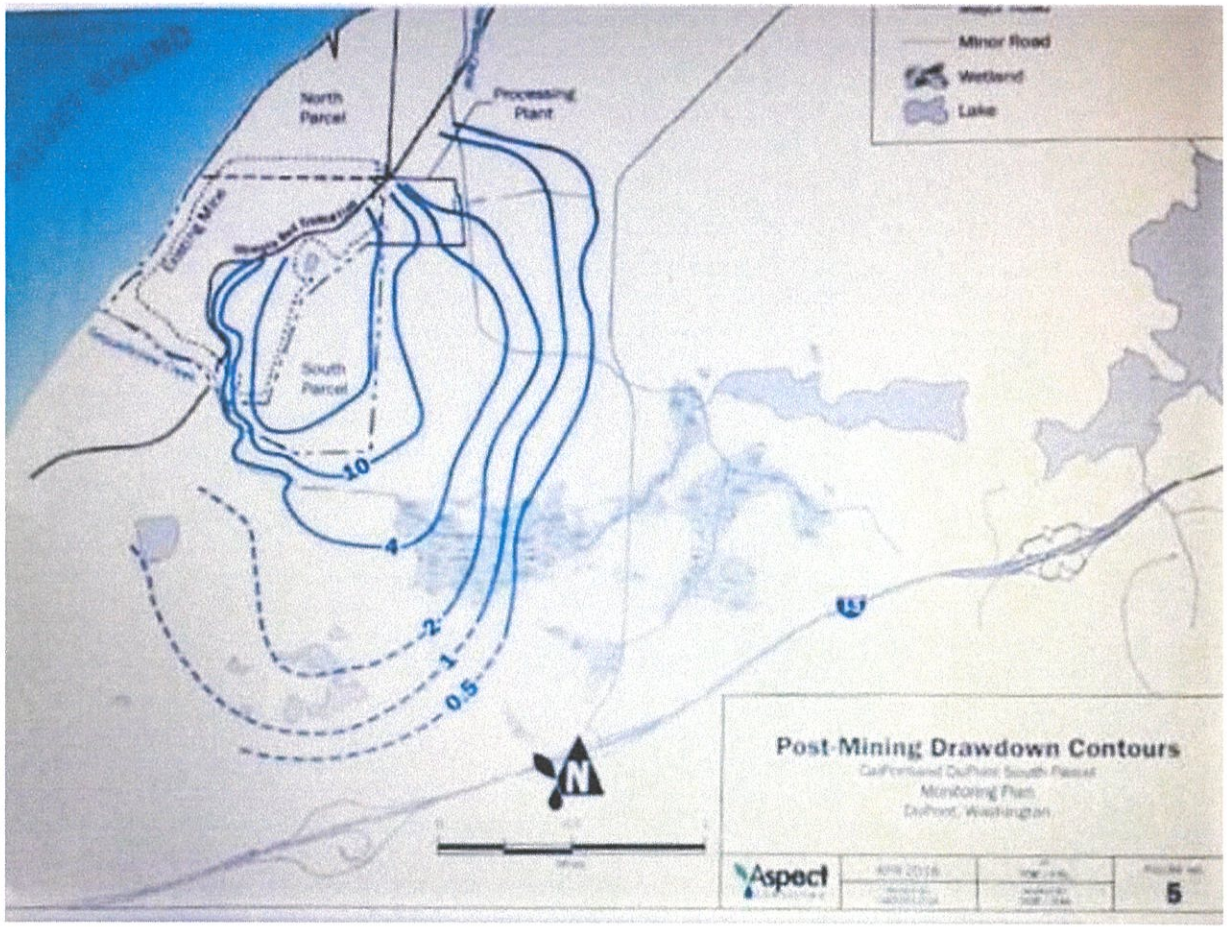
Note that the solid green line is shown as underlying and supporting groundwater that currently manifests itself as surface water in Edmond Marsh whereas after the dewatering pumps are turned off and removed that the Vashon aquifer groundwater level will be well below Edmond Marsh. Disconnect the groundwater that supports Edmond Marsh, and it will dry up.

How CalPortland proposes to dewater the Vashon aquifer is shown in the below illustration.

Note the extensive array of dewatering pumps around the south and east perimeter of the mine pit. Also note that the combined discharge of these pumps is discharged into Edmond Marsh.

This technique will provide substantial pumped groundwater flow from the west end of Edmond marsh and down the ravine reach of Sequalitchew Creek. However, once the dewatering pumps are turned off and removed water in Edmond Marsh and flow in the ravine reach of Sequalitchew Creek will disappear. The effect of dewatering on groundwater level is illustrated below.

6
DS
Cal



Consequence of permitting dewatering of the Vashon aquifer

It will only become evident when the dewatering pumps are turned off 14 years hence that the disastrous ecological effect will become evident to the Department of Ecology, Environmental Caucus members, Nisqually Tribe, WDFW, DNR and the citizens of DuPont.

There will be no viable salmon habitat in the Sequalitchew Creek sub watershed, no functional Edmond Marsh wetland, and no groundwater discharge flow in Sequalitchew Creek. In other words, the Sequalitchew Creek watershed will become as groundwater discharge deprived and dysfunctional as much of the Clover Creek subbasin watershed.

7
DS
Cal

Such an outcome would render the 700-acre mined out groundwater flooded pit unfit for any subsequent development by the City of DuPont.

The validity of the Sequalitchew Creek Restoration Plan

The 2011 Settlement Agreement required that the Sequalitchew Creek Restoration Plan incorporate the below five elements (as defined by CalPortland's consultants Aspect and Anchor) for the Plan to be approved by CalPortland and the Environmental Caucus.

4.1.1. Improvement of gradients so [surface] *water discharges from Hamer and Bell Marshes flow into Edmond Marsh rather than into the diversion canal.*

4.1.2. Improvements to create significant [surface water] *flows from Sequalitchew Lake into the Edmond Marsh complex to support a functional creek ecosystem, and provide for the passage of migratory fish in the Sequalitchew Creek system. To achieve this goal, the Parties will consider, at minimum, modification of the diversion canal flood control structure and gradients.*

4.1.3. Rehabilitation of Edmond Marsh by removal of sufficient fill and other flow impediments to provide the hydraulic gradients and capacity necessary to achieve and maintain adequate [surface water] *flows through the Marsh.*

8
DS
Cal

4.1.4. Rehabilitation of Sequalitchew Creek below Edmond Marsh to reduce seepage, improve fish habitat, and help restore year-round [surface water] *flows.*

4.1.5. Active management of beaver activities to maintain the hydraulic gradients that provide [surface water] *flows through Hamer, Bell, and Edmond marshes. For purposes of this section, "active management of beaver activities" means management commencing with the least intrusive method and progressing to more intrusive methods only as necessary to maintain hydraulic gradients and flows, with lethal removal utilized only as a last resort.*

The above inserted bracketed words make it clear that CalPortland incorrectly assumed that Sequalitchew Creek is a surface water driven system. It is not. It is a groundwater discharge driven system that over the years has been adversely impacted by ever declining Vahon aquifer groundwater levels and ever increasing quantities of stormwater runoff being discharged into this once pristine salmon bearing groundwater fed upper Sequalitchew Creek and associated Edmond Marsh wetland complex.

Unfortunately, these CalPortland consultant prescribed elements were never vetted by others to determine whether they were grounded in a proper characterization of the 2011 condition of the Sequalitchew Creek watershed. In stream flows are dependent upon shallow aquifer groundwater levels. Ground water withdrawals (dewatering) are antithetical to surface water flow in the Edmond Marsh/Sequalitchew Creek ecosystem.

9
DS
Cal

What CalPortland's consultants monitored during the period from 2003 up until till 2011 and upon which the Sequalitchew Creek Restoration Plan was built no longer represents the condition of the Sequalitchew Creek watershed today. Therefore, the Sequalitchew Creek Restoration Plan proposed by CalPortland/Environmental Caucus and the South Puget Sound Salmon Enhancement Group is not relevant to addressing today's degraded condition of Edmond Marsh and what little is left of a naturally flowing and functioning Sequalitchew Creek.

10
DS
Cal

Action Scenario A – Continuation of Existing Conditions; No Action Scenario B – Site Development Under Existing Zoning

At the time that the South Parcel mine area was designated as being within DuPont's mineral overlay zone it was assumed that the Vashon aquifer groundwater level was sufficiently below the land surface to enable dry gravel mining operations in that area. Subsequent hydrological exploration by CalPortland determined that this was simply not the case. The appropriate action upon discovering this fact should have been the removal of the South Parcel as included with DuPont's mineral overlay zone and the land subject to development under provisions of the City of DuPont's zoning regulations. It is not too late to correct this mineral overlay zone designation error. Its dewatering to access Vashon aquifer saturated gravel under dry mining conditions should not be permitted for reasons previously cited and that these No Action scenarios be seriously considered and chosen over the Vashon aquifer dewatering scheme.

11 DS City Cal

A collaboratively developed, CalPortland/City of DuPont Sequalitchew Creek Restoration Action Plan Scenario Option

The CalPortland and Environmental Caucus Sequalitchew Creek Restoration Action Plan that was agreed to under provisions of the 2011 Settlement Agreement **is not adequate mitigation** for all direct and indirect adverse environmental impacts of dewatering and mining under dry conditions the South Parcel.

12 DS City Cal

A restoration plan for the Sequalitchew Creek watershed that is based upon an understanding of the *hydrology* of the area, *native salmonid habitat requirements* and the *conditions* that now adversely impact water quality and salmonid habitat in the Sequalitchew Creek watershed would embody the following essential action elements executed in the sequence proposed.

13 DS City Cal

Phase 1. Remove culvert by City Hall and walkway beneath Center Drive

Restoration action should start with simultaneous removal of the culvert beneath the berm located in the vicinity of City Hall and its replacement with either an open box culvert or a foot bridge and removal of the sidewalk beneath the Center Drive overpass. Both actions should be undertaken and completed before removing existing beaver dams. The culvert and sidewalk are physical obstructions to flow in a surface water drainage ditch (euphemistically referred to as a "dry reach of Sequalitchew Creek") that should be removed as an integral part of the City's obligation to properly design, construct, operate and maintain its surface water management system. DuPont city codes recognize such drainage ditch work as necessary and highly desirable. Furthermore, this work can be undertaken as soon as practical without an HPA permit since no in water work of a salmon bear stream is involved. Such an opportunity will be negated by releasing up gradient beaver dam impound water prior to this work being completed.

14 DS Cal City

Compare this fact-based Phase 1 approach with the fiction based Sequalitchew Creek Watershed Restoration Plan that advocates removal of Edmond Marsh's eastern most beaver dam that prevents water in Edmond Marsh flowing eastward and draining into the diversion canal and placing pond levelers in the balance of Edmond Marsh's beaver dams! Beaver dam ponds are the proximate cause of water flow and water quality problems in Edmond Marsh!! The

Restoration Plan's stated Vision, if it is to be realized, requires that all beaver dams, culverts, sidewalk below Center Drive and the railroad berm obstructions to east to west flow of discharging groundwater and salmon passage be removed.

Phase 2. Remove westernmost beaver dam, then those eastward, except eastern most

Once removal of the culvert and sidewalk impediments to surface water runoff flow is accomplished the western most West Edmond Marsh beaver dam should be removed (not provided with a pond leveled) so that the pond that it contains is lowered to its pre beaver dam impact level. Following its removal the next upstream Edmond Marsh beaver dam should be removed. This sequencing of beaver dam removals should proceed until all beaver dam impediments to east to west flow are removed from East and West Edmond Marsh. The eastern most beaver dam should remain in place unless it is established that surface water flow from Sequalitchew Lake is necessary to augment groundwater discharge flowing into Sequalitchew Creek Marsh/East Edmond Marsh/West Edmond Marsh is inadequate to achieve sufficient flow from groundwater discharge alone.

15 DS Cal City

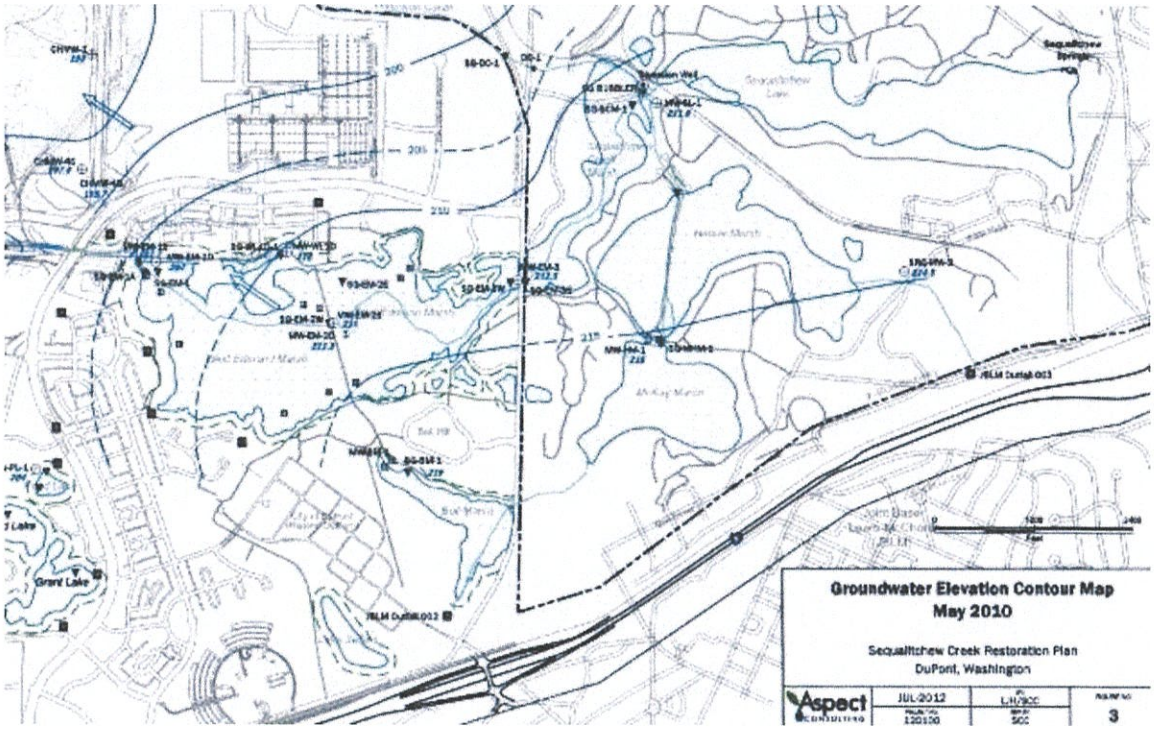
The result of beaver dam removal and clearing existing culverts will be a lower surface water level throughout Edmond Marsh (its historic condition) and restoration of a significant and unimpeded east to west flow of a seasonally fluctuating in quality, quantity and mix of surface and ground water flowing through the system. Beaver dam removal and the clearing of existing culverts will enhance water flow through Edmond Marsh to the extent that accumulated fine grained sediment contained in groundwater fed areas of Edmond Marsh will be flushed out of the Marsh and become the "seal" material to reduce surface water infiltration losses in the "dry reach of Sequalitchew Creek", thus assuring enhanced surface water flow through this "dry" drainage ditch reach of Sequalitchew Creek.

Phase 3. Remove south end of railroad trail, span with bridge

Once water levels are lowered in East and West Edmond Marsh as a result of beaver dam removal and existing culverts are cleaned out, the south end of the railroad berm trail should be removed, and the gap spanned by a pedestrian bridge. This is the one major capital project that will require design, HPA permitting and construction. When this final obstruction to east west flow in Edmond Marsh is completed, historic groundwater fed, gravel bed, meandering Sequalitchew Creek (as described in The 1997 Chambers-Clover Creek Watershed Management Committee Watershed Characterization report) can be created by constructing a groundwater discharge fed upper Sequalitchew Creek channel all along the southeast shoreline of Edmond Marsh to take advantage of the following facts.

16 DS Cal City

The below Aspect illustration clearly indicates that the source of water in Edmond Marsh is groundwater that is discharging from the southeast into Edmond Marsh. You will note that the groundwater level along the southeast shoreline of Edmond Marsh is at an elevation of 215 feet whereas the surface water level in central Edmond Marsh is at approximately 213 feet due to beaver dam impoundment. The water level in Sequalitchew Lake is controlled at approximately 211.5 feet. Surface water flowing from Sequalitchew Lake into Edmond Marsh is not and cannot be the source of water in Edmond Marsh, since water does not run uphill.



16 cont

Groundwater is entering Edmond Marsh all along its southeastern shoreline. Beaver dams, culverts and the railroad berm obstructions to east to west water flow through Edmond Marsh has resulted in inundation of former Sequalitchew Creek, its adjacent wetlands and caused extensive flooding of areas of former dry land. These same obstructions to east to west flow have created stagnant pools of water that have high dry season water temperatures, low dissolved oxygen, low pH, high concentrations of dissolved methane gas and in West Edmond Marsh high concentrations of dissolved and particulate iron and a recipient (i.e., detention and infiltration pond) of storm water runoff from Palisades Village.

I have included two papers in this comment submittal package that provide the rationale for CalPortland and the City of DuPont considering my proposed third CalPortland/City of DuPont Sequalitchew Creek Restoration Action Plan Scenario Option.

The first paper titled Sequalitchew Creek Dug Channel Proposal was submitted to the parties to the 2011 Settlement Agreement on 10/1/2012.

17 DS Cal City

The second paper titled Restoration of the Sequalitchew Creek Watershed was submitted to CalPortland, Environmental Caucus members and the South Sound Salmon Enhancement Group on 7/23/2020.

If this CalPortland/City of DuPont Sequalitchew Creek Restoration Action Plan Scenario Option is adopted and implemented native salmonid will once again inhabit the low gradient glacial flood plain upland portion of a restored Sequalitchew Creek watershed and the relative merits of reconciling the first two opposing Scenario options presented in the Pioneer Aggregates South Parcel Project – EIS will thereby become readily apparent to CalPortland and the citizens of the City of DuPont.

Concluding comment

Before any gravel mining activity is permitted in the South Parcel a fact-based CalPortland/City of DuPont Sequalitchew Creek Restoration Action Plan should be executed by CalPortland followed by a hydrological study of the extent to which Vashon aquifer groundwater lowering has been achieved by execution of the Plan. Then a determination of how deep gravel mining operations could be conducted pursuant to the original mining permit's restriction of "10 feet above Vashon aquifer groundwater level".

2012 paper titled: An Examination and Evaluation of Alternative 2.1.6 Infiltrate Stormwater and Groundwater Discharges to Recharge Puget Sound Springs

10/1/2012 paper titled: Sequalitchew Creek Dug Channel Proposal

Illustration of the Dug Channel route shown in red in relationship to referenced Aspect Key Beaver Dams

7/23/2020 paper titled: Restoration of the Sequalitchew Creek Watershed

AN EXAMINATION AND EVALUATION OF ALTERNATIVE 2.1.6

Preface

This paper examines and fatal flaw evaluates Alternative 2.1.6 Infiltrate Stormwater and Groundwater Discharges to Recharge Puget Sound Springs. It does so by reciting passages from the March 25, 2010 Draft Feasibility Study (in italics), providing evaluation commentary (in this print format) and offers a conclusion regarding its fatal flaw status.

Relevant Passages and Commentary

"The purpose of the Feasibility Study is to identify and evaluate alternatives for improving or restoring ecosystem functions in the Sequalitchew Creek watershed."

"... surface water features within the Sequalitchew Creek basin are hydraulically connected and interact with the groundwater system."

"It is these mingled Vashon Aquifer and sea level aquifer waters that form the Puget Sound shoreline springs, referred to as the Large and Small Springs north of the mouth of Sequalitchew Creek."

"Groundwater discharges as springs and seeps in the lower Sequalitchew Creek... and provides the majority of creek baseflow which varies between approximately 0.5 cubic feet per second (cfs)(summer) and 1.5 cfs (winter). Dewatering the Vashon aquifer and excavating gravel in the South Expansion Area at or below the elevation of the adjacent Sequalitchew Creek bed will cause diminishment or cessation of base flow in Sequalitchew Creek. This is clearly a violation of the no impact provision of the 1994 Agreement.

"The post-mining groundwater discharge is predicted to average about 7 cfs and range seasonally from 6 to 9 cfs."

"A 1.78-acre kettle wetland is located in a large, closed depression that lies near the center of the existing mine site. The kettle wetland vegetation communities are relatively susceptible to changes in groundwater hydrology, which directly control water levels in the wetland." Alternative 2.1.6 would eliminate this Class 2 wetland. Such an act would be in violation of a provision (25 foot buffer) of CalPortland's current mining permit and the City of DuPont's municipal code DMC 25.105.070.1(f).

"West Edmond Marsh is an approximate 135-acre wetland with a hydraulic regime dominated by surface water inputs to the south and east." Alternative 2.1.6 would impact this Class 1 wetland by lowering the groundwater level 1.5 feet beneath West Edmond Marsh. The City of DuPont's municipal code DMC 25.105.070.1(f) states that alteration of Class 1 wetlands is prohibited.

"A 0.13-acre seep wetland complex of two long, very narrow, and non-contiguous wetlands is located just above the trail along Sequalitchew Creek at about RM 0.75 to 0.85." Alternative 2.1.6 would disconnect this wetland complex from the groundwater source that sustains it. The elimination of this seep wetland complex would be in violation of DMC 25.105.070.1(f). Since the water that flows from this wetland discharges into Sequalitchew Creek such an act would be in violation of the 1994 Agreement.

"The underlying zoning of the mine site is a mix of residential (North Expansion Area) and manufacturing and industrial (South Expansion Area) designations, and the mine is included within a mineral resources overlay. Mining activities are considered a temporary use and are consistent with the underlying zoning. Future land use is an important consideration in any alternative proposed for this study." RCW 78.44.031(11) states that "Although both the need for and practicability of reclamation will control the type and degree of reclamation in any specific surface mine, the basic objective shall be to reestablish on a perpetual basis the vegetative cover, soil stability, and water conditions appropriate to the approved subsequent use of the surface mine and to prevent or mitigate future environmental degradation." 6 to 9 cubic feet per second of discharging groundwater emanating from the east sloping face of the South Expansion Area and flowing out onto exposed impervious Olympia Bed soil and its commingling with stormwater runoff poses an in perpetuity problem that neither industrial tenants or the City of DuPont should have to face. Such a scenario seems in clear violation of the basic objective of mine reclamation as cited in RCW 78.44.031(11). Furthermore, to convey this quantity of groundwater and commingled stormwater runoff to the central mine area and North Expansion Area for treatment and infiltration seems incongruous with the intended residential use of these areas of the spent mine as well.

"Mining is permitted only above the aquifer and a 25-foot separation (10-foot separation for slopes) is required between mining activities and the seasonal high groundwater level. Stormwater is managed onsite through infiltration." [Page 25, lines 19 – 22] This is a current restriction in CalPortland's aggregate mining permit. This restriction makes good environmental sense in that: *"...surface water features within the Sequalitchew Creek basin are hydraulically connected and interact with the groundwater system."* Alternative 2.1.6 would adversely impact the surface water features of Kettle, Seep and Edmond Marsh wetlands and Sequalitchew Creek since they are all hydraulically connected and interact with the groundwater system that CalPortland proposes to dramatically alter by dewatering the Vashon aquifer that sustains these critical and sensitive surface water bodies.

"The goal of the alternatives in this section is to avoid, minimize, and/or mitigate any change to the aquifer levels in the project area. These alternatives would also avoid and minimize any change to the flow of Sequalitchew Creek from current levels." [Page 28, lines 25 – 27] Note the subtle shift in the above language from that stated as the purpose of the Feasibility Study, which states: *"The purpose of the Feasibility Study is to identify and evaluate alternatives for improving or restoring ecosystem functions in the Sequalitchew Creek watershed."* The words *minimize* and *mitigate* are incongruous with

the words *improving* and *restoring* as they related to change to aquifer levels or stream flow in the Sequalitchew Creek watershed. Alternative 2.1.6 further degrades the natural functioning of Kettle, seep and Edmond Marsh wetlands, diminishes flow in Sequalitchew Creek and infiltrates commingled physically and chemically altered groundwater and polluted stormwater runoff into the groundwater that feeds pristine Puget Sound Springs, the latter of which flows onto a shoreline of state wide significance.

Alternative 2.1.5 Infiltrate Dewatering Water within the Mine is no longer being consider because: *"This alternative was determined to be infeasible by consensus of the parties to the memorandum of understanding."* [Page 76, lines 16 -17] How then can infiltrating stormwater runoff from 177 acres of manufacturing and industrial facilities built on impervious Olympia Bed soils and 8.3 cubic feet per second of discharging groundwater within the mine be judged as feasible when Alternative 2.1.5 which was judged by the parties to the memorandum of understanding as *infeasible*?

Alternative 2.1.6 would involve: *"...design, permitting, and construction of 1,000 feet of tightline pipe 1,250 feet of ditch, and a 0.5-acre to 5.4-acre infiltration pond..." "Water quality pre-treatment may be necessary depending on whether the groundwater system also intercepts stormwater."* It is highly unlikely that stormwater and groundwater can be kept separate. 8.3 cubic feet per second of discharging groundwater, containing fine grained particulate matter, would emanate from the exposed east sloped wall of the excavated South Expansion Area. This wall face will be exposed to the same precipitation falling on the impervious Olympia Bed soil at the bottom of the pit. Discharging groundwater, sediment from stormwater exposed and eroding sloped mine walls and runoff from impervious surfaces collected in drainage ditches would make segregation of groundwater discharge and stormwater runoff highly unlikely, if not impossible. Therefore, the entire combined flow of 8.3 cfs of groundwater and stormwater runoff from 177 acres would have to be treated to remove sediment and pollutants before being conveyed to infiltration ponds lest the buildup of fine-grained particulate matter negate the ability of the ponds to infiltrate the water. As far as using this water to recharge Puget Sound Springs is concerned there is no cost-effective treatment available to remove soluble pollutants (e.g., nutrients, heavy metals, organic compounds) from infiltrating surface water runoff. They will pass unaltered to contaminate the diminished groundwater supply of the Puget Sound Springs.

"Planning, design, permitting, and construction of this alternative is anticipated to cost... between $900,000 and $1,200,000 if all mine stormwater, dewatering, and post-mining groundwater discharge is infiltrated. The higher costs also include construction of 5.5 acres of wetland mitigation." Missing from this cost analysis is the costs to the City of DuPont (and its manufacturing, industrial, and residential property owners in the form of surface water management fees) of on-going (in perpetuity) operation, maintenance and eventual replacement of these surface water management facilities. Construction of 5.5 acres of wetland mitigation is incongruous with the stated purpose of the Feasibility Study, i.e., *"... to identify and evaluate alternatives for improving or restoring ecosystem functions in the Sequalitchew Creek watershed."* Constructed wetland seldom provides the natural function and value of the destroyed wetlands that

they are supposed to mitigate. Constructed wetlands are seldom self-sustaining and require on-going maintenance (in this case by the City of DuPont) if they are to provide essential wetland function and value. The assumption that 5.5 acres of constructed wetlands in the midst of a manufacturing and industrial complex, or for that matter in the midst of a residential area, will adequately mitigate the elimination of Kettle and Seep wetlands, further degradation of 135 acre Edmond Marsh and a reduction in the base flow of lower Sequalitchew Creek borders on the ludicrous.

"Some ongoing monitoring and maintenance would be required to ensure continued function of the conveyance and infiltration [and the 5.5-acre constructed wetland] *system. Maintenance would include periodic inspection of the tightline and weir, removal of any accumulated debris, and removal of accumulated sediment from the infiltration pond* [and a 5.5 acre constructed wetland since it would not be self-sustaining]. What funding source is proposed to cover the costs to the City of DuPont for ongoing operation, maintenance and replacement of these facilities? CalPortland will be long gone from the scene.

"Groundwater would be segregated from stormwater and would be infiltrated back into the ground. No detectable change in overall water quality is anticipated." It is naive to believe that no detectable change in overall water quality will occur as a result of implementing what is proposed in 2.1.6. As mentioned above it is highly unlikely, if not impossible, to segregate 8.3 cfs of groundwater flowing out of the east wall of the mine onto the floor of the mine from precipitation falling on this same wall and on 177 acres of impervious Olympia Bed soil. The infiltration of this combined water through a 5 (as CalPortland has suggested) or 25 feet (as the current mining permit dictates) of underlying pervious course grained gravel (assuming that this water is conveyed away from the area underlain by Olympia Bed soil) is going to impact the quality and quantity of groundwater discharging into Puget Sound via the Puget Sound Springs.

"If all the mine stormwater, and temporary and post-mining groundwater discharges are infiltrated, this alternative would have similar effects as construction of North Sequalitchew Creek would have... on the flow regime in the upper reach of the Sequalitchew Creek Ravine, marshes, and aquifer levels. The adverse *effects* referred to above were grounds for the Environmental Coalition to conclude that the North Sequalitchew Creek alternative was fatally flawed. I believe that the Environmental Coalition should, for the same reasons, conclude that Alternative 2.1.6 is fatally flawed.

In regard to sustainability: *"This* [2.1.6] *alternative would require a modest level of ongoing maintenance to keep the passive dewatering system functioning smoothly. The key to sustainability is providing adequate water quality treatment to avoid impacting the long-term function of the infiltration pond. The type of water quality pre-treatment necessary would depend on whether the collection system also intercepts stormwater."* I would disagree with the word *modest.* As mentioned previously a surface water management system that complies with NPDES requirements for the discharge of surface water runoff (discharging groundwater now on the surface being a component thereof) by infiltration into an underlying aquifer and thence to Puget Sound and the operation,

maintenance and requirement for the periodic replace of the requisite facilities to handle the quantity of water described herein will overwhelm the very limited financial capacity and staff of the City of DuPont.

Is Alternative 2.1.6 Fatally Flawed?

I believe so.

Alternative 2.1.6 has an in perpetuity adverse environmental impact on the groundwater hydrology of the Sequalitchew Creek watershed and its groundwater dependent springs (including Puget Sound Springs), wetlands and Sequalitchew Creek and an in perpetuity adverse on-going financial impact on the City of DuPont and its citizens.

Unfortunately, the Memorandum of Understanding/Feasibility Study process proposed and managed by CalPortland has focused on mitigating the adverse environmental impacts that dewater the Vashon aquifer will have on the function and value of an already degraded Edmond Marsh and Sequalitchew Creek. Its motivation is to increase its take of gravel from the South Expansion Area where the gravel is now saturated by the Vashon aquifer. CalPortland has offered fish population enhancement via a proposed North Sequalitchew Creek to gain support for this alternative by the Nisqually Tribe and the Washington Department of Fish and Wildlife. If fish population enhancement is the goal of the Nisqually Tribe and the Washington Department of Fish and Wildlife then I submit that they need to support alternatives that enhanced discharge of Vashon aquifer groundwater discharge into and through Edmond Marsh and down Sequalitchew Creek Canyon and oppose Alternative 2.1.6 which will infiltrate a ground/storm water blend of polluted water that will degrade the quality and quantity the water of Puget Sound Springs which discharge onto critical and sensitive near shore habitat that is vital to salmon recovery.

The interests of the citizens of the City of DuPont have been poorly represented during the entire MOU/FS process. Citizens have been relegated the role of spectators with their opportunity to participate limited to 15 minutes at the conclusion of FS meetings. Yet it is the citizens of DuPont whose property values, quality of life and surface water management fees are going to be most impacted by the decisions that are made by CalPortland, Environmental Coalition and governmental agency representatives. Unfortunately the City Manager, City Attorney and members of City staff have not acted in the best interests of the citizens of DuPont otherwise they would have applied and enforced the City's critical and sensitive area ordinances at the time that CalPortland applied for a Conditional Use Permit that allowed dewatering of the Vashon aquifer.

In the final analysis all the Alternatives that have been proposed and considered by the participants in the MOU/FS process that allow dewatering of the Vashon aquifer are fatally flawed if the purpose of the process is: *... to identify and evaluate alternatives for improving or restoring ecosystem functions in the Sequalitchew Creek watershed."*

SEQUALITCHEW CREEK DUG CHANNEL PROPOSAL

Preface

I have proposed that a Sequalitchew Creek channel be dug (excavated) along the toe of the highlands located along the southern shoreline of Edmond Marsh to (1) capture the groundwater discharge that emanates at this location, (2) provide a cold water refugia for coho salmon during the dry season, (3) provide an accessible and easily maintained open water path for water flowing into and through Edmond Marsh, and (4) restore a flowing Sequalitchew Creek from DuPont-Steilacoom Road to the head of and down Sequalitchew Creek Canyon. There are numerous past and proposed examples of using dug channels to accomplish a variety of functions (e.g., farming, flood control, fish passage and habitat) in Edmond Marsh and throughout the Sequalitchew Creek watershed. This paper presents an argument for excavating a fish friendly channel in the location previously described.

A History of Dug Channels

The first channels dug during the mid to late 1800s in the Edmond Marsh-Sequalitchew Creek watershed had as their purpose the lowering of the surface water levels in Edmond, Hamer, Mckay and Bell Marshes to expose and access the fertile soils of the Marsh for farming.

A major channel (the diversion canal) was dug in 1954 to protect Fort Lewis' Sequalitchew Springs domestic drinking water source from the adverse impacts of area wide groundwater flooding events. In subsequent years this channel and related water level control weirs has functioned as a surface and groundwater drainage system as the water levels in Sequalitchew Creek and East Edmond Marshes have increased as a result of beaver dam construction.

During the 1970s the WDFW used Sequalitchew Lake for salmon rearing activities. So that these reared fish could access Puget Sound the WDFW constructed and maintained an unobstructed and open water channel through East and West Edmond Marshes to Sequalitchew Creek.

During the period of Weyerhaeuser's residential development of the DuPont area Sequalitchew Creek was rerouted via a dug channel (over groundwater unsaturated gravel soil) to its present location beneath Center Drive.

In 2009 CalPortland proposed construction of a dug channel (North Sequalitchew Creek) at the toe of the east bank of the South Parcel gravel pit excavation to intercept discharging groundwater and convey this groundwater discharge through a cut in the north wall of the Squalitchew Creek Canyon and into the lower Canyon reach of Sequalitchew Creek.

As the above attests constructing dug channels in the Sequalitchew Creek watershed to accomplish various objectives is certainly nothing new or novel.

The Rationale for a Dug Channel Paralleling the Southern Highlands

The stated objective of the Restoration Plan planning process is to develop a Plan that upon its implementation will result in the creation of *"..a functional creek ecosystem and provide* [suitable habitat] *for... migratory fish in the Sequalitchew Creek system... "*

In order to achieve this objective there needs to be restoration of both perennial surface and ground water flow into and through Edmond Marsh and down the Canyon reach of Sequalitchew Creek.

The source of surface water has been identified as coming from Sequalitchew Lake (a groundwater fed lake). It is important to restore this unimpeded component of flow into and through Sequalitchew Creek Marsh and Edmond Marsh and down the Canyon reach of Sequalitchew Creek. It is also important to recognize that this surface water flow will vary seasonally and epochally and thus require active management to assure adequate dry season flow on the one hand and prevent excessive wet season (and occasional groundwater flood event) flows into Edmond Marsh and down Sequalitchew Creek on the other hand.

What has not been addressed is how to restore groundwater discharge into Edmond Marsh. To restore this vital component of flow will require interception of groundwater discharge from areas that currently have groundwater table levels that are higher than the surface water level of Edmond Marsh. These areas of higher groundwater table level lie to the south and southeast of Edmond Marsh. A dug channel (aka Sequalitchew Creek) should be excavated close and parallel (resulting in sinuosity) to the toe of the highlands (and higher groundwater table areas) that border the southern shoreline of Edmond Marsh.

There is already ample precedence for dug channels in the Sequalitchew Creek watershed as the history of human development in this watershed attests. Why not create a dug channel that accomplishes the objective of the Restoration Plan?

Advantages of a southern shoreline dug channel

These advantages include:

An active, unobstructed, accessible and relatively easy to maintain surface and ground water flow channel from Sequalitchew Lake through Edmond Marsh and down the Canyon reach of Sequalitchew Creek.

A lowering of the surface water level of Edmond Marsh will increase the horizontal gradient of the system and hydraulic head vis-a-vis Sequalitchew Lake and Bell, McKay

and Hamer Marshes thus enhancing both surface and ground water flow into and through Edmond Marsh.

Provide a cold water, ample dissolved oxygen refugia for coho salmon during the dry season and during low (or no) and warm surface water flow from Sequalitchew Lake.

The relatively narrow width of a dug channel located at the south end of the railroad berm trail where the sewer line is at its highest elevation above the surface of Edmond Marsh would enable lower cost construction of an elevated bridge, suspended sewer line and viewing platform over Edmond Marsh and the Sequalitchew Creek dug channel.

Lowering the surface water elevation of Edmond Marsh will remove the water in the Marsh that now overlies the beaver dam inundated northern boundary of Edmond Marsh. Since this area is characterized by pervious gravel soils and is disconnected from sustaining groundwater it constitutes a major source of water loss from the Marsh as a result of infiltration and evapotranspiration.

Should CalPortland be permitted to mine the South Parcel the adverse environmental impact of dewatering in this area would be reduced as Edmond Marsh and Sequalitchew Creek are moved further away from the dewatering impacted area. Also the diminishment of groundwater discharge into the Canyon reach of Squalitchew Creek as a result of dewatering the South Parcel would be mitigated by a significantly enhanced flow of water through Edmond Marsh and down the Canyon reach of Sequalitchew Creek.

A dug channel as proposed would enhance the ecological function of Edmond Marsh, assure restoration of suitable migratory fish habitat, facilitate the requisite human maintenance of flow through conditions (i.e., beaver management), provide the citizens of DuPont and visitors visual access to Edmond Marsh and Squalitchew Creek and likely be consider adequate mitigation (provide that CalPortland funded the construction of the dug channel and related amenities) for the adverse environmental impact of CalPortland being permitting to mine the South Parcel.

Regulatory and financial impediments to constructing such a channel

Currently DuPont sensitive area ordinances prohibit any alteration of Edmond Marsh. The City Council has the authority to change DuPont's sensitive area ordinances and should do so to allow the creation of a flow through dug channel (aka Sequalitchew Creek flowing within the boundary of Edmond Marsh).

Other environmental regulatory agencies generally allow alteration of sensitive areas provided there is either no net loss or enhancement of ecological function. A dug channel as proposed would constitute a significant net gain in the ecological function of Edmond Marsh and Squalitchew Creek.

RESTORATION OF THE SEQUALITCHEW CREEK WATERSHED

Preface

This paper presents an alternative approach *"... for improving ecosystem functions in the Sequalitchew Creek's watershed."* to that now being offered by CalPortland as part of the Memorandum of Understanding process. The presumption here is that *"... improving ecosystem functions in the Sequalitchew Creek watershed* requires restoration of this watershed, not mitigation for the permanent environmental damage that will occur as a result of dewatering the Vashon aquifer.

The Meaning of Restoration

The Washington State Department of Ecology recognizes that "restoration" does not mean restoration of degraded groundwater, seeps, wetlands, streams, lakes and Puget Sound to pre European settlement conditions. This is a common misconception. Rather it means restoring, in so much as feasible, the natural ecological function and value of impaired groundwater, seeps, wetlands, streams, lakes and Puget Sound. It is instructive to consider the natural ecological functioning of the ecological units that comprise the American Lake-Sequalitchew Creek watershed when considering restoration options. Once this understanding is achieved the various alternatives that have been proposed during the MOU process can be evaluated on their ecological merits.

The Natural Condition of the American Lake/Sequalitchew Creek Watershed

Sequalitchew Creek is located within the Chambers-Clover Washington State Water Resources Area 12 (WRIA 12). WRIA 12 is comprised of a number of sub-basin watersheds. The best known of these is the Chambers-Clover Creek Basin which is comprised of several sub-basins. Not as well known is the American Lake sub-basin. Just as Chambers Creek is the surface water drainage stream to Puget Sound for Clover Creek, Sequalitchew Creek is the surface water drainage stream to Puget Sound for the American Lake sub-basin. [See the Chambers-Clover Technical Assessment Final Report, April 10, 2003, Figure 1.1 Base Map]

Contrary to Glacier Northwest's assertion that the headwaters of Sequalitchew Creek is Edmonds Marsh, the headwaters of Sequalitchew Creek is Murray Creek (formerly called Upper Sequalitchew Creek) which flows into American Lake, the largest natural lake in Pierce County. American Lake has a surface water level significantly higher (by 20 feet) than that of Sequalitchew Lake. Because of this difference in lake levels, their close proximity and intervening porous gravel soil there is considerable subsurface (groundwater) flow from American Lake to Sequalitchew Springs and Sequalitchew Lake. Occasionally, as a result of high groundwater levels, there is surface water flow from American Lake to Sequalitchew Lake. Surface water outflow from Sequalitchew Lake, supplemented by localized groundwater discharge from the Vashon aquifer, provided the water that sustained an extensive complex of Class I wetlands and Sequalitchew Creek.

The source of water that sustained and nourished the American Lake-Sequalitchew Creek watershed (ecosystem) was (and is) precipitation in the form of rainfall. The shallow gradient of this watershed and its permeable soils allowed precipitation to infiltrate into the ground where it fell rather than run off into its streams, wetlands and lakes. Several natural water conditioning processes were important to the proper functioning of this watershed. Precipitation falling on vegetated soil was cleansed of airborne pollutants (oxides of nitrogen, phosphorus and sulfur) as a result of their being assimilated by plants and adsorbed to fine grained topsoil particles. These airborne pollutants were primarily from volcanic eruptions, naturally occurring forest fires and the burning of grasslands by native Americans. Infiltrating rainwater percolating through topsoil beneath the vegetative cover picked up respired carbon dioxide from soil bacteria. This functioned to impart a degree of acidity to infiltrating rain water. Mildly acidic water percolating through underlying soil dissolved calcium from gravel deposits to form water soluble calcium bicarbonate. Calcium ions in water moderate fish gill function and must be present in appropriate concentration to assure proper functioning of gill tissue. Bicarbonate ions functioned as important buffers. Buffers prevent water from becoming either too acidic or too alkaline to support salmon. Chemically conditioned infiltrating water became the substance that comprised the Vashon aquifer. The gravel deposits of the Vashon aquifer functioned as a sponge that both stored groundwater and slowly released (discharged) it to springs, streams, wetlands and lakes. Vashon aquifer groundwater discharge was the natural and historic source of water for the springs, streams, wetlands and lakes in the American Lake-Sequalitchew Creek watershed.

Groundwater is insulated from the effects of fluctuations in surface temperature. Its temperature stabilizes and remains at approximately 50 degrees F throughout the entire season. Groundwater, under the influence of gravity, flows slowly through gravel soils from areas of higher elevation to areas of lower elevation. It ultimately surfaces (discharges) with its physical (low temperature) and chemical (calcium and bicarbonate) properties intact to become the water that flows from a spring or becomes the water in a salmon friendly stream, wetland, or lake, or discharges subsurface into Puget Sound. Salmon evolved, and thrived, in clean, cool, well oxygenated, calcium rich and buffered fresh water habitats. Eventually salmon commenced migrating to saltwater where food was more plentiful than in their freshwater habitat. Making a transition from a fresh water environment to salt water environment and the reverse requires major physiological changes in the functioning of fish gills. This transition takes time and is facilitated by salmon spending time in the fresh-salt (brackish) water estuaries which were located at the mouth of all salmon bearing streams.

There are natural seasonal and long term fluctuations in the amount of precipitation falling on the American Lake/Sequalitchew Creek watershed. These fluctuations affect groundwater levels. During the wet season, or prolonged periods of precipitation, groundwater levels are high (as a result of recharge) as is groundwater discharge to springs, stream, wetlands and lakes. During the dry season, or periods of drought, groundwater levels are low which diminishes the volume of groundwater discharged to springs, streams, wetlands and lakes. Under extremely dry conditions (or as a result of

humans limiting the amount of infiltration of precipitation to groundwater or withdrawal of groundwater for consumption) streams, wetlands and lakes can loose their connectivity with groundwater. When this occurs water from surface water bodies will infiltration (leak) into adjacent and underlying unsaturated soils with the result that spring and stream flows diminish or disappear all together and wetland and lake levels drop, or result in their drying up completely, with adverse effects on native species of vegetation, fish, and wildlife. It is this condition, whether naturally occurring or brought about by human impact, that favors the displacement of native vegetation and establishment of invasive species.

Under natural (historic) conditions wet season increase in groundwater discharge to streams, wetlands and lakes had several desirable effects. It increased stream flows sufficiently to provide salmon access to suitable spawning habitat. Increased groundwater discharge into streams back flushed (dislodged) the fine grained sediments that had accumulated in the stream bed during dry season low flow periods. Re-suspended sediment particles were flushed out of the system by stream flows enhanced by contributions from groundwater flooded upstream wetlands and lakes. Stream beds cleansed of silt by this natural process provided salmon optimum stream bed conditions for spawning. During the dry season cool, dissolved oxygen and calcium enriched, and buffered groundwater discharging into streams, wetlands and lakes provided optimal environmental conditions for salmon egg survival and the rearing of young salmon.

Prior to 1850 the natural conditions and watershed functions described above prevailed throughout the American Lake/Sequalitchew Creek watershed. Sequalitchew Creek was a perennial stream with a discharge of from 10 to 20 cfs that flowed into a fresh-salt water estuary. As a result the American Lake/Sequalitchew Creek watershed provided habitat for coho, sockeye and chum salmon, sea run cutthroat trout and steelhead (rainbow trout) and supported a viable Indian fishery. All this began to changed when white European settlers arrived in this area and began to "develop" the American Lake/Sequalitchew Creek watershed

Degradation of the American Lake/Sequalitchew Creek Watershed

In the middle 1800s and early 1900s the American Lake-Sequalitchew Creek watershed was adversely affected by timber harvesting in the Sequalitchew Canyon. This led to instability of its canyon walls and increased silting of the lower reach of Sequalitchew Creek. This condition was exacerbated when the fresh-salt water estuary at the mouth of Sequalitchew Creek was transected by a railroad bed. A five by five foot culvert was constructed to allow water exchange between Sequalitchew Creek and Puget Sound. The constriction in water flow caused by the undersized culvert allowed silt to accumulate and eventually fill in the upper portion of the fresh-salt water estuary thus destroying its function as a salt-to-fresh/fresh-to-salt water transition zone for salmon.

In 1916 when Fort Lewis was being developed American Lake's level was 239 feet above msl. [TNT article 10/8/51] American Lake is a major source of recharge to the Vashon aquifer during the dry season. It also provides a prolific subsurface flow to down

gradient Sequalitchew Springs. As part of the development of Fort Lewis the Army Corps of Engineers tapped Sequalitchew Springs as the domestic water source for personnel serving on the Army base. After domestic use most of the water withdrawn from Sequalitchew Springs was returned (as recharge) to the Vashon aquifer by way of infiltration from septic systems. Thus there was little adverse effect on groundwater levels and impact on the watershed as a result of the Army's consumptive use of Sequalitchew Springs water. Later, however, water withdrawn from Sequalitchew Springs would, after its use, enter sewer lines and be conveyed to the Army's Solo Point sewage treatment plant for discharge into Puget Sound. Thus Vashon aquifer recharge in the Sequalitchew Creek basin was diminished as was groundwater table level.

American Lake's shoreline, not owned by Fort Lewis, Camp Murray and the Veterans Hospital, was extensively developed during the period from 1920 through the 1940's. This development took place during a period of below average precipitation in the American Lake watershed when the lake level had dropped and remained below 235 feet above msl. Whereas old time residents who were familiar with the natural seasonal and decadal rise and fall of American Lake level built their homes upland from the lake, newcomers to American Lake built their homes close to the lake shore.

In 1951, as a result of several years of increasing precipitation, American Lake level rose to 237 feet above msl. The result was extensive groundwater flooding of shoreline homes and septic systems around the lake that had been built during the period of low water. Lakeshore residents complained and asked the U.S. Army Corps of Engineers to construct a groundwater flood control structure at their end of the lake that would prevent groundwater flooding damage to lake side homes and septic systems. The Army's position at that time was that it had no responsibility to mitigate the impact of high lake water level. Their argument was that the lake level in 1951was two feet below the 239 foot above msl level that existed when the Army first began developing Fort Lewis in 1916 and that the lake level rise to 237 feet above msl was a natural condition.

Extensive groundwater flooding in the American Lake-Sequalitchew Creek watershed occurred again in 1956. [TNT article 1/10/56] This time the groundwater flooding adversely affected properties owned by the Army, notably their Sequalitchew Springs domestic water works and some of the Army facilities that had been constructed near wetlands during the 1920 to 1950 period of low groundwater levels. 1956's groundwater flooding of wetlands located near these facilities was exacerbated by the Army's practice of conveying surface water runoff from impervious surfaces to these wetlands. The impact of draining surface water runoff to wetlands and superimposing it on ground water flooded wetlands was a sobering new experience for the people at Fort Lewis.

In 1951 the U.S Army began construction of a means to control Sequalitchew Lake's level so that it could no longer rise to levels that would endanger its Sequalitchew Springs domestic water supply. Provisions were also made to control the water level in wetlands located in close proximity of Army facilities constructed during the period of low groundwater levels. The flood control structure that was built to deal with these two issues was comprised of a weir complex at the south end of Sequalitchew Lake and a

flood water diversion canal. In response to 1956's ground and surface water flooding event the U.S. Army constructed a groundwater flood control weir at the south end of American Lake. It was designed to prevent American Lake level from exceeding 233 feet above msl.

The purpose of these two structures was to convey flood water affecting Sequalitchew Lake and related marshes to Puget Sound, yet still provide headwater flow for Sequalitchew Creek. Under natural conditions the surface flood water routed to Puget Sound via the diversion canal would have infiltrated into permeable soils to recharge the Vashon aquifer and thus sustain the groundwater level (water table) necessary to maintain the proper functioning of Edmond Marsh and Sequalitchew Creek. Unfortunately the diversion canal as now operated has functioned to "dewater" (by lowering the water table) the upper reach of Sequalitchew Creek, reduced natural east to west flow throughout Edmond Marsh, and during periods of low groundwater table level or beaver dam building activity causes the water in East Edmond Marsh to flow backward toward and into the diversion canal.

Lowering American Lake's water level from 239 to 233 feet above msl, withdrawing groundwater from Sequalitchew Springs to meet the U. S. Army's need for a domestic water supply, diverted Sequalitchew Springs water, after use, to the Solo Point sewage treatment plant for discharge to Puget Sound, increasing impervious surfaces thus reducing groundwater recharge, diverting most of Sequalitchew Lake's and related wetlands' groundwater contribution and surface water runoff down the diversion canal to Puget Sound all conspired to lower mean groundwater levels throughout the American Lake/Sequalitchew Creek watershed by approximately six feet over a span of 100 years. The cumulative effect of these actions reduced historic Sequalitchew Creek perennial flow to Puget Sound from 10 to 20 cfs to 1 to 2 cfs.

[The recent (2004 et al) groundwater studies done and the application of the groundwater model used to determine the effects of dewatering the Vashon aquifer in the South Expansion Area are based upon a groundwater table that has been lowered and stream flows altered by human activity over the past one hundred years. Reliance on this recently gathered data and model results and the heterogeneous nature of the Vashon Drift are of questionable value in assessing the likely impact of dewatering the Vashon aquifer, or for that matter, the effectiveness of any proposed mitigation]

The practice of using natural and historic wetlands as surface water runoff treatment, detention and infiltration ponds has contributed significantly to the degradation of the American Lake-Sequalitchew Creek watershed. When surface water runoff is introduced into groundwater fed streams, wetlands and lakes it changes the flow regime and physical and chemical properties of their water and alters their biological response in ways that degrade their natural functioning and suitability as fish and wildlife habitat. What occurs is a dramatic increase in the range of water levels fluctuations (e.g., streams and wetlands experience alternating periods of flooding and drying), anoxic and toxic bottom sediments build up as a result of accumulations of particulate matter conveyed by surface water runoff, water stagnates leading to dry season high water temperatures and low

dissolved oxygen, fish and amphibian kills occur, native plants, fish and wildlife are displaced by invasive species, toxic algae blooms occur in ponds and lakes and estuaries are lost due to sediment build up and pollution. These water quality problems are now prevalent throughout much of the Chambers-Clover Creek watershed and are of particular concern when considering the likely fate of the American Lake-Sequalitchew Creek ecosystem should Glacier Northwest be permitted to dewater the Vashon aquifer.

Restoration of Historic Sequalitchew Creek

One of the six announced goals of the Puget Sound Partnership is: *"An ecosystem that is supported by ground water levels as well as river and stream flow levels sufficient to sustain people, fish, wildlife, and the natural functions of the environment."*

In spite of the extent and magnitude of degradation that has occurred in the American Lake-Sequalitchew watershed during the past 150 years much of this degradation can be mitigated, i.e., its ecosystem can largely be restored. American Lake level can be raised from 233 feet to 235 feet above msl by simply raising the height of the south end weir by two feet. The diversionary canal at the south west end of Sequalitchew should be used only to mitigate the occasional adverse impact of area wide surface and groundwater flooding. Discharge from Sequalitchew Lake and related wetlands should be allowed to either flow down Sequalitchew Creek or infiltrate to recharge groundwater rather than be lost to the watershed by its conveyance via the diversion canal to Puget Sound. Sequalitchew Spring domestic water supply can be returned to groundwater after use and treatment by allowing it to infiltrating and recharge the Vashon groundwater aquifer up gradient of I-5 rather than piping it to the Solo Point sewage treatment facility and subsequently discharging it into Puget Sound. This mitigation would provide the additional benefit of stopping the discharge of millions of gallons per year of nutrient rich effluent into already degraded South Puget Sound. The practice of using natural wetlands as surface water runoff detention, treatment, and infiltration ponds should be discontinued. These functions should be separated with detention and treatment being carried out in constructed and maintained detention and treatment ponds that function to remove sediments, nutrients and pollutants from surface water runoff. The cleansed surface water runoff could then be released to existing natural wetlands to maintain their natural hydrologic functioning. The former, but now sediment filled, brackish marsh at the mouth of Sequalitchew Creek could be restored as a salt-to-fresh and fresh-to-salt water transition zone for salmon by the removing the accumulated sediments that now render it ineffective for this purpose.

By restoring and maintaining near historic groundwater levels increases in steam flows and wetland and lake levels would follow. By protecting, maintaining and restoring native vegetation and top soil their water cleansing and conditioning functions would be restored. By preventing aquifer dewatering and gravel removal from sensitive areas their storage capacity and slow time release of cool clear, clean water into streams, wetlands and lakes would be sustained. If these things were done PSP's goal to *"... sustain people, fish, wildlife, and the natural functions of the environment."* would be realized in the American Lake-Sequalitchew Creek watershed.

The Benefits of Restoring the Historic Sequalitchew Creek Corridor

Restoration of the historic Sequalitchew Lake to Puget Sound salmon and wildlife corridor would provide the following benefits.

- Salmon access to their historic and natural spawning grounds and over-the-dry season salmon young (smolts) rearing habitats (i.e., groundwater fed marshes).

- In addition to restoration of chum and coho salmon runs there exists the possibility of restoration of sockeye salmon populations once access to groundwater fed Sequalitchew Lake is re-established.

- A restored and functioning salmon bearing stream running through the heart of the City of DuPont would enhance the City's attractiveness for residents and a major draw for tourists.

- The natural hydrology of the American Lake sub-watershed would be restored which would assure healthy and natural functioning of the many springs, streams, wetlands and lakes that comprise this watershed.

- Groundwater quantity and quality would improve as a result of restoration of the natural functioning of the extensive wetlands and the ponds and lakes than are features of this sub-watershed. Wetlands function to remove pollutants from surface water prior to its infiltrating to recharge underlying aquifers. They provide over-the-dry season refuge for young salmon. And they store and release surface water to recharge the aquifers (as do the ponds and lakes) upon which domestic water supplies depend during the dry season.

- There is far greater certainty that salmon would return in sustainable numbers, and much sooner, to a restored historic Sequalitchew Creek than they would to a degraded lower Sequalitchew Creek and brackish marsh and a constructed, and highly questionable, North Fork Sequalitchew Creek that can only be accessed by salmon passing through a 500 foot long pipe.

None of these benefits can be realized if Glacier Northwest is allowed to dewater the Vashon aquifer in order to increase its take from their DuPont gravel mine. There is simply no effective mitigation for the extensive removal of natural vegetation, top soil, and water bearing gravel soil and loss of hundreds of acres of upland Class 1 wetlands that Glacier Northwest's mine expansion and dewatering of the Vashon aquifer will cause.

An Unintended (?) Consequence

Should CalPortland be permitted to remove gravel down to the Olympia Beds the effect will be to eliminate 177 acres of previous forested land and replace it with a flat,

featureless and impervious surface that will accumulate standing (flood) water and sheet flow runoff in an area designated for industrial development. Located adjacent to this industrial area will be, under CalPortland's preferred alternative, a constructed surface water mine drainage ditch (North Sequalitchew Creek). There will be a strong temptation to dispose of surface water runoff by routing it to and down this constructed mine drainage ditch. It difficult to image that a mine drainage ditch located at the back of an industrial park will be perceived as *"... improving ecosystem functions in the Sequalitchew Creek's watershed."* or improving the quality of life and aesthetic pleasure of the citizens of DuPont.

Conclusion

The natural condition of the American Lake-Sequalitchew Creek watershed is best describe as its being a precipitation, infiltration, water conditioning, groundwater storage and discharge to surface water bodies hydrologic system. Surface water bodies reflected discharging groundwater physical and chemical attributes. Water in streams and lakes was cold, clear, devoid of excessive nutrients, toxic materials and sediments. Fluctuations in seasonal stream flows and wetland and lake levels were dampened (muted) as a result of the storage capacity and delayed response of groundwater discharge to variations in precipitation. Native plants, salmon and trout, amphibians, birds and wildlife evolved, were attuned to, thrived and their populations sustain in this environment.

In the past 150 years human activities have altered this natural condition. Groundwater recharge has been diminished as a result of impervious surfaces and the practice of draining surface, waste stream and flood water to Puget Sound. Groundwater has been polluted as a result of infiltrating untreated waste water (septic effluent) and runoff water into gravel soils. Groundwater withdrawals have increased to provide water for domestic and industrial consumption. As a result the natural functioning of the American Lake-Sequalitchew Creek has been degraded, but restorable. Dewatering the Vashon aquifer in the South Expansion Area will further and permanently degrade this watershed. Dewatering the Vashon aquifer should not be permitted.

Steven Schenk

1473 Kittson Street, Dupont

253-307-7208

14 Jul 24

RECEIVED
JUL 15 2024
CITY OF DUPONT

City of DuPont:

I recommend disapproval of this project for three reasons. No viable reclamation of the land mine plan has been put forward to date; the dewatering of Sequalitchew Creek and existing marshland surrounding it; and failure to fully account for current and future noise levels and the effects on residents.

Water:

The draft EIS statement below tells the story. It is criminal to allow for the dewatering of an existing aquifer without 100% knowledge of the impact of surrounding water supplies in the long term. The draft EIS makes assumptions that are unacceptable given climate change, our current park and trail system and water supplies. Water supplies not just for DuPont *but the surrounding area.*

"Vashon Aquifer water levels would decrease due to dewatering activities needed for mining. Ultimately, the gravel deposits of which the Vashon Aquifer is comprised would be removed from the Re-Mine Area and part of the South Parcel. Drawdown of the Vashon Aquifer is anticipated to affect groundwater within a one to two-mile radius from the proposed mine sit"

1 DS

"Marsh System - Water levels in the off-site marshes are expected to be lowered, due to the proposed groundwater lowering"

"Up to 79% of the groundwater flows to Sequalitchew Creek would be lost."

Noise:

The application is too simple and incorrect regarding noise. It waves away potential noise as a hazard to residents especially at Creek Side apartments. The below quotes from draft EIS basically say as the bulldozers move around the mine the noise level will vary. Well,

2 EA

YES. No city official will be monitoring where and when bulldozers at the mine operate. A potentially mitigating action the city can do now is update its noise ordinance.

From page 3-7 Draft EIS. *"The sound levels when a bulldozer is working very near the Expansion Area portion of the site boundaries in Phase 2C are substantially higher than the baseline sound levels at the upper floors of the Creekside Apartments (R1a), resulting in potential increases of 8 to 16 dBA. If these sound levels were experienced throughout the life of the project, they would represent a substantial increase. However, the modeled levels at the Creekside Apartments are dominated by noise from a bulldozer working on the slope of 2C very near the southern site boundary. This worst-case condition would only occur during Phase 2C excavation. Even during Phase 2C excavation, the bulldozer would split its time between excavation in Phase 2C and excavation in the existing mining areas farther north and west, and sound levels much of the time would be substantially lower than the worst-case levels identified. The variation in sound levels over the life of the mine and the variation in day-to-day bulldozer activities would reduce the reported potential noise impacts at the Creekside Apartments due to increases over baseline levels"*

2 cont

"CUMULATIVE IMPACTS The annual amount of mining activity, and associated noise conditions, with the Proposed Action in combination with mining at the Existing Mine would not exceed current levels, and cumulative mining noise impacts are not anticipated. In addition, noise impacts associated with mining would be temporary in nature and would occur some distance from potential future development that could occur in the vicinity, and no significant cumulative noise impacts are anticipated."

Reclamation of site after mining.

No viable reclamation plan has been developed to date. This mine will permanently scar the landscape and dewater marshland and the city's creek. One only needs to look at historical photos and research the millions spent by government to reclaim Chambers Bay. When this mining company was in its earlier form, they denuded the hill slope at what is now Chambers Bay golf course. This was a source of pollution and eroded into Puget Sound for decades.

3 Cal

To the point, there is no viable plan to hold the company accountable to reclaim and put back to nature what they have already mined. The idea that DNR will not review a reclamation plan until after city issues permits for mining either is a joke or the law needs changed if indeed the law. I believe the reclamation plan needs to be briefed to the city and its citizens before any permits issued.

-OF NOTE- ALL IMPACTS of MINE EXPANSION are ON public LAND. very little ON LAND (besides where the dig is) CALPORTLAND OWNS. THEY don't OWN creek, aquifer, OR MARSH.

4 EA

7/12/24 Letter 189

RECEIVED
JUL 15 2024
CITY OF DUPONT

DEAR DIRECTOR KINCAID,

I am extremely concerned about the proposed CalPortland South Parcel mine expansion and its impact on the groundwater due to dewatering the Vashon Aquifer. This could significantly affect surrounding vegetation and increase fire danger for our residents, homes, and businesses. It would dry up the seeps along the Sequalitchew trail, causing the hillside slopes to dry up. If the South Parcel mine expansion receives a permit the creek water alongside the trail would go dry for almost half a year. Currently the underground water from the Vashon Aquifer feels the lush hillside as well as the creek and our wetlands. Please DO NOT approve a mining permit that will destroy our stream, our hillside, and our wetlands in PERPETUITY. No mitigations exist. Nor is any mitigation proposed, that would protect our environment. 1 DS

The projected drop in groundwater level up to 9 feet in Edmonds Marsh is of specific concern. This drop in groundwater level will likely put Dupont residents at an even greater risk of fire danger. 2 DS

Climate conditions have worsened since the 2011 Settlement Agreement was prepared. The City of Dupont is surrounded by forests and climate change is already the risk of fire to our residents. 3 DS

Restoring Sequalitchew Creek does not have to depend on dewatering the Vashon Aquifer. It should be restored without dewatering the Vashon Aquifer. In face, CalPortland could be a great community partner by funding the restoration WITHOUT dewatering the acquirer. 4 EA

Thank you,

Harold Schmidt and Linda Smith
2084 McDonald Ave
Dupont, Wa 98327

If you have concerns regarding the EARTH, please describe them below.
Do you own property within DuPont's shoreline?

Yes. Our home backs on Edmond's Marsh.

How do you use the shoreline in DuPont? (passive viewing, fishing, walking, biking, boating, etc.)

We take hikes/walks, bike ride in the area, beach comb with the kids, bird watch, and are novice wildlife photograpers.

How often do you use the shoreline for each of these activities? Please be specific.

We walk the area around the marsh nearly daily. We hike or run along the creek about once/wk, more often during the summer months.

What do you value most about DuPont's shoreline? (views, public access opportunities, water quality, wildlife, etc.)
Access to the water, and the presence of wildlife living tucked into an area that is so populated....including a Western Pond Turtle that we found injured from Edmond's Marsh behind us, and took to a wildlife rehab. expert for the Woodland Park Zoo. We have also seen birds that are rarely seen in Washington State in the area (Edmond's Marsh) behind our home. There are also many deer, raccoons, squirrels, birds, coyote's and various birds who call the Marsh area "home". I took some wonderful pictures of a Great Horned Owl at the edge of the marsh, yesterday. I also think it is AMAZING that we have a salmon stream in our community!

1
EA

What is your vision for DuPont's shoreline? (public access, habitat restoration, water-enjoyment uses, other)
First, I would like to see environmental experts consulted with, who can provide accurate, unbiased scientific data on this. This is a far cry from what has happened up to this point. Historical knowledge of the water table is extremely important to this. I would like to see our city officials act on this information in the interest of protecting, and restoring, our waterways. I would absolutely like to see habitat restoration, with restoration of the water flow to the Creek, and the surrounding waterways. I think it would be wonderful to have a public "swimming hole", as the town of Dupont historically did. What a treasure this would be for all of us, and a big draw from outside the community, with the trails and access to the sound. I wish to see active protection of our watershed, and water basin. I am willing, without a doubt, to pay increased taxes in order to see this happen.

2
EA
City

What is your greatest concern, if any, about DuPont's shorelines and its future?

The mining poses a huge risk. This certainly needs to be limited and controlled carefully. We need to actively protect, and restore, all of our waterways, including Edmond's Marsh, and the Sequalitchew Creek. My son is a fifth grade student who participates in the Washington Virtual Academy, through our school district. He has been studying watersheds, basins, and collection areas, along with the crucial need for water conservation and preservation. We need to tread lightly, as drilling or mining into our aquifer could lead to lowering our water table, eventually leading to drought issues. For very basic information on how this can occur, I would recommend this site: http://imnh.isu.edu/digitalatlas/hydr/concepts/gwater/aquifer.htm
I absolutely believe that our future quality of life as Dupont residents, rests heavily on decisions that are being made by our Counsel Members at this current juncture.

In 2010 we were asked to answer a series of questions about land use, the shoreline, and information pertinent to the mining operations. I wanted to share my answers to that Q and A, as I felt it was pertinent to the decisions that are currently being made. I wish to place it on record, as a DuPont citizen and homeowner of 22 years, I am emphatically opposing the dewatering of our aquifer, and think it's terribly foolish to even consider it, as we know protecting our water sources is of VITAL importance, as it's one of our most valuable resources.

Re: Comments pertaining to the proposed work by Pioneer Aggregates South Parcel Project
City File No. SEPA2021-002

Attn. Barb Kincaid

We understand that the proposed project involves the mining of gravel deposits located adjacent to Sequalitchew Creek and the natural riparian area associated with it. The work would necessitate the dewatering of the aquifer that supplies water to the creek and associated wetlands (including Edmond Marsh).

The dewatering of soils in the South Parcel area of the gravel mine would have a devastating impact to the current condition and volume of water passing through the aquifer soils that hydrate the marsh and creek. Any change to hydrology of this remarkable, natural environment would have devastating impacts to the forest, which provides shade, clean water and temperature moderation for the creek as well as habitat for the existing wildlife, and noise/visual buffering for all who currently live nearby, and enjoy park-like City trail system. 1 DS

The history of DuPont **IS** the resource of Sequalitchew Creek and Edmond Marsh. Native Americans, and later the Hudson Bay Company/Fort Nisqually relied upon these waters for their sustenance and livelihood. This water is the **REASON** that attracted the human settlement of our area (the <u>first</u> European settlement on Puget Sound!) It is inconceivable to us that the company or the City would consider any dewatering and mining of property adjacent to the creek and the subsequent destruction of that element of our historical legacy. 2 EA

Too often we have heard "Oh, our project won't harm the natural environment ... and if does, we will fix it back as good as it was before". We know the reality of strip mines and superfund sites that take their profits and then run out of money to fix their damage. Besides, how could anyone restore (recreate) such a well balanced and beautiful area as is the Sequalitchew Creek! 3 EA

No, this area is best left alone. This proposed project **WILL** have an adverse environmental impact to Sequalitchew Creek, Edmond Marsh and the City and environs of DuPont.

Sincerely,

David and Christine Schnell

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

The Sequalitchew Creek and trail is a feature of the city, and enjoyed by likely hundreds of people every week, connecting us to the water, and creating tourism for a city that otherwise struggles to attract visitors. Please, please do not permanently destroy the beauty of this area for short term gains for one business. As a homeowner, I was not to see this city thrive, and this permitting would be a move away from long-term success.

If you have concerns regarding the EARTH, please describe them below.
We know that water is becoming a valuable asset and this company would disrupt and possibly ruin our water supply for the future. This company does not pay enough to the city to make it worth it. But the bottom line is we are destroying what bit of nature we have. It would be a shame to see the land raped of its resources. The constant growth in this area is getting out of control and is making even a bigger mess of our roads and infrastructure. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.
I'm always concerned of air quality due to fires. 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
I don't think we should left them get near our water source. It is shared by many areas and it would destroy the creek runny through there and could seriously ruin our water source. 3 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
We should always protect these areas. Water will decrease in these areas, so I have heard. 4 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
We need to protect the wildlife that is here before it is to late. 5 EA

If you have concerns regarding NOISE, please describe them below.
Always hate the noise. 6 EA

If you have concerns regarding LAND USE, please describe them below.
We don't need to keep putting down concrete everywhere possible. 7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

It will look like any other dug up space. I prefer trees and forest area.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

More traffic in an area that cannot handle what it has now. Most days everyone sits in traffic, it can become real annoying because there are not other roads to go on and you can gets stuck for long periods of time.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

CalPortland should be denied the opportunity to dewater (dry out) the Vashon Aquifer. The water table(s) in our area need to be protected and kept from being lowered by even the smallest amount. Reducing water levels will have a negative effect upon plant life which supports wildlife in so many ways, i.e. food and protection. This area has suffered enough from development already as evidenced by the reduction of wildlife which this area used to enjoy.

If you have concerns regarding the EARTH, please describe them below.

Unless the city of DuPont plans to build an amphitheater that will plan and host outdoor concerts and events then what's the plan for the gaping hole in the ground? Will the taxpayers have to find the money to buy the landfill to fill it up? What's the plan?

1 EA City

If you have concerns regarding the AIR QUALITY, please describe them below.

Obviously the air quality would suffer.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

They plan to de-water a potable drinking water aquifer. That should be illegal. Clean potable water is vital for our survival. Allowing billionaires to destroy our natural resources is the highest form of stupidity. If they de-water the aquifer and we have no potable water because they destroyed FOREVER due to salt water intrusion then all of our homes will be worthless. They have not done the proper study to see if saltwater intrusion would occur. If the city allows them to do this then the city should prepare for lawsuits. Hauling water is not an option.

2 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Cal Portland said they'd restore Sequalitchew Creek over a decade ago and I have seen zero work towards that effort. Why would anyone believe they care about any of this is beyond me. They want money from the resources that are not theirs to take. We the People of DuPont will never benefit in any way from their destruction of property. They're not paying off my home, are they paying off yours? They're not building a community center and pool. They're not contributing any money to anything but to their own pockets.

3 DS EA City

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Absolutely. There's been enough destruction of habitat after all of these gross warehouses and semi truck traffic. We don't need more.

4 EA

If you have concerns regarding NOISE, please describe them below.

Clearly. It's already noisy enough here with the interstate that has no sound barrier and the current semi truck traffic.

5 EA

If you have concerns regarding LAND USE, please describe them below.

Yes. They depleted their land. They can't have ours too. If they want it so badly they can buy the land they want to use for however much it would costs to pay off everyone's mortgage loans. At least the people of DuPont would get something out of the deal that way. If they can go for a ridiculously big ask then so can we.

6 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

Yes. Enough. It's gross.

7 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

The Nisqually Indians can speak for themselves here.

8 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

Too many semi trucks and construction trucks already. It's not safe.

9 EA

If you have OTHER concerns not listed above, please describe them below.

The fact that the same few people constantly have to fight to stop the same insane crap from happening in this city over and over and over. I should be asleep but instead I'm writing. It's ridiculous this crap is allowed to keep happening. Enough is enough.

10 EA

If you have concerns regarding the EARTH, please describe them below.
DuPont is a beautiful oasis. Cutting off the water to our will destroy the beautiful green forest. Do not allow it to happen.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.
The trees and natural habitats help to keep our air quality.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
The streams and wetlands keep everything free and lusciously beautiful. It will all go away if there is no water.

3 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

Humans are destroying our Earth and we as citizens need to step up in advocate for it. The gravel company will just keep digging away until there's nothing left and their profits are made and then they'll move on. When is enough enough? 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Additional exhaust from continued equipment digging and moving and digging and moving and digging and moving. Additional dust from more years of digging and crunching the rock. 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Our aquifer is not set up to have continuous assault placed on it. The more earth that is removed only stands to reason that the water that finally hits our aquifer is going to be affected so therefore the aquifer has no chance. You cannot expect it to remain the same when we keep pulling more water out of it. 3 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Sequailichew Creek will be forever doomed and our aquifer greatly impacted by this expansion. 4 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Squirrels, raccoons, frogs, fish, dear, bear, etc etc etc etc all call our sequality and Dupont area home. With further expansion of this gravel company and housing we are just pushing them out of their natural habitat and before long they will be forever gone. Shame on us. 5 EA

If you have concerns regarding NOISE, please describe them below.

With the expansion of the gravel company right into our backyards it only makes sense to know that the sound of the equipment will impact the noise level tremendously! More equipment, more trucks, more vehicles of all sorts etc etc etc 6 EA

If you have concerns regarding LAND USE, please describe them below.

The more that is given up to companies like the gravel company the less there will be for the community use. Our land is being devastated by the gravel company and once it's gone it's gone.

7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

It's ommon sense that once the trees and bushes and fauna are gone as the gravel company completed their expansion that it will impact the visual beauty of this area. Look at what their current digging and dredging has done too this equality area. They have removed tons and tons of Earth. It will never be the same.

8 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

Stands to reason that anytime anything grows it also incorporates more vehicles hence more transportation. DuPont does not need any further transportation issues as it cannot handle what it currently has.

9 EA

If you have OTHER concerns not listed above, please describe them below.

Tired of companies making billions of dollars at the expense of the community. I vote know to any expansion. Save our Sequalitchew habitat to include the air quality, land use, animals that live and reside, groundwater and aquifer. You can do a gazillion test and manipulate them to say that it will have no impact but that is utter ridiculousness. Of course it will and in a very adverse manner.

10 EA

If you have concerns regarding the EARTH, please describe them below.

I find it appalling that more of our precious earth and soil needs to be profit for this gravel company to expand. Once the ground soil is Disturbed it doesn't matter what you do it will never be the same as created by God. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Imagine more dust and truck fumes in our environment and our neighborhood due to the expanded vehicle use that will be required for this expansion. Pollution, including air pollution is a massive concern that we all should be aware of. This expansion will only increase our air pollution with exhaust and more dust. 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Company does not care about the aquifer All they want to do is make money. I do not believe a single report that comes out saying that the sequela chew aquifer will not be disturbed as there's no possible way that it cannot be if this project is to continue. So quality Trail is already a mere trickle of what it used to be and this will only further decrease it. 3 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Once any of our water is diverted or land removed that moves the water underneath it The streams and the ground surface will be effective in a negative way. Our wetlands and sequality Trail are priceless treasures that this company could care less about as long as they make a profit. 4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Plants will be forever gone, homes for the animals will be forever gone and our precious so quality area will be changed dramatically forever. Haven't they made enough money already at the expense of the area and the land? 5 EA

If you have concerns regarding NOISE, please describe them below.

Trucks, trucks, trucks, trucks!! How many more vehicles will be coming in and out of the Sequoia chew area as this expansion occurs? Fumes dust and massive gas use. None of the trucks are silent and the noise pollution will escalate. We have a beautiful place that just needs to be left alone. Go take your trucks and your expansion elsewhere as you've already desecrated the land that you currently have. 6 EA

If you have concerns regarding LAND USE, please describe them below.

I would dare anybody to produce a photograph of the current land use owned by the gravel mine and compare it with what it looks like now. What once was a beautiful area now is decimated.

7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

You rape the land you can never get it back. You can tell me you'll plant trees or foliage but it will never be the way it was when it was created by God.

8 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

Everything for money and the bottom profits for a company. Nobody cares about cultural resources or if they do it's only lip service. Our area is rich with history from the native Americans that once resided here to the fort that later followed them and push them out. This land is a very spiritual area and needs to be left alone

9 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

The more we take from this area the less there is of nature that's left. More people more cars more trucks more transportation more gravel trucks more more more more more

10 EA

If you have OTHER concerns not listed above, please describe them below.

Absolutely 1,000% opposed to this expansion and the harm it will forever create in our community.

11 EA

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

I have concerns about the amount of dust and other contaminants that would come from the mining operations, including vehicles. Thousands of people, their pets , and other wildlife utilize the Sequalitchew Creek Trail and the surrounding areas every year. The apartments and the DuPont Community Garden will have their air quality adversely affected, as well as those who live in the Edmonds Village neighborhood.

1 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Reducing the water level in the aquifer can cause sinkholes and have negative effects on local water levels. This could cause the water bills for residents to increase dramatically if we need to find another water source for the city's water.

2 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Biodiversity is tremendous in this area. The mining project will have a devastating impact on that biodiversity.

3 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding NOISE, please describe them below.

I live in Edmonds Village. I moved to DuPont because it was overall a very quiet community. I didn't move here to hear loud machinery day in and day out.

4 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

The amount of heavy trucks already improperly using Center Drive is more than enough. I can't imagine what will happen when truck's GPS tells them Powerline Rd is a viable route.

5
EA

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

We have enjoyed seeing the responsible growth of DuPont and love the Sequalitchchew Trail as a shaded/native growth/natural animal habitat walk with our dog. The idea that this area could be destroyed by the expansion of a local gravel mine is SO disheartening! With all need for water/clean water access with the growth of population to this region of the South Sound, it seems like a backwards move to approve an expansion that endangers such an important Aquifer. The idea that for months of the year, after the Aquifer is 'dewatered' there would be 'dry' creeks, wetlands, vegetation, seems like an automatic no to that expansion would be the choice. The increased Fire risk due to 'dry' areas and then a lack of access to water to fight the fires seems like another issue to consider. Please consider a no vote for this expansion.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Mining near the creek may disturb the aquifer, reducing the plants along the Trail. With reduced vegetation, it will become harder for the animals in the area to find food.

1 EA

If you have concerns regarding NOISE, please describe them below.

I live near the expansion area. I don't want to hear mining next door.

2 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

I am concerned that expanding the mining area will disturb the aquifer, reducing the water to the existing vegetation and causing it to dry up/die off. If this happens, the hillside along the creek will become barren and ugly.

3 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If the mining results in a die off or reduction in the vegetation above the creek and trail, then every time it rains there will be mud sliding onto the trail and into the creek. The trail is a desirable method of exercising and enjoying nature, I would rather it stay that way.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

(SEPA2021-002 comment period 6/14/2024-7/15/2024)

RECEIVED
JUL 15 2024
CITY OF DUPONT

Public Records Comments Opposing Permitting the Mining Expansion of the South Parcel

I strongly oppose the mine expansion of the South Parcel. I think it would negatively affect Sequalitchew Creek, Edmond Marsh, our wetlands, and the Sequalitchew Creek Trail slopes. It would also drain the Vashon Aquifer, which is a potential source of drinking water for DuPont. DuPont still has water rights to the aquifer, issued in 1948. 1 DS

One of the great things about DuPont is the protected natural areas and trails. We need to maintain these areas for all residents to use and enjoy. The Sequalitchew Trail is used by DuPont residents, as well as visitors from other areas. It is an important natural feature in the Pacific Northwest. 2 EA

I strongly urge the city to deny the permit to expand the South Parcel mining. Please keep the wonderful nature areas of DuPont healthy and viable for use by residents, now, and in the future. 3 EA

Christy Stephenson
2193 McDonald Ave.
DuPont, WA 98327

Christy Stephenson

RECEIVED
JUL 15 2024
CITY OF DUPONT

To: The City of DuPont (City Council)

From: Norm Stephenson, 2193 McDonald Avenue, DuPont, WA 98327

Subject:: Concerns About Approval of Mining Expansion Negatively Affecting Dewatering of the Vashion Aquifer and the Environment

Mining gravel could impact water levels in the Vashion Aquifer, resulting in negative impacts on vegetation, soil, habitat, trails, fire risks, wetlands, potable drinking water, and the general earth environment.

1
DS

According to my recent research, there is no real mitigation plan that would prevent irreversible dewatering in the aquifer.

I urge the city to deny the permit to expand the CalPortland South Parcel mining.

Norman D. Stephenson

If you have concerns regarding the EARTH, please describe them below.
I am highly concerned that this project prioritizes corporate profitability over the long term environmental sustainability of the area and its surroundings. The optics of this move indicate that a renege of previous commitments of the mine, and I do not believe any mitigations I've observed will satisfy these concerns. Please consider having a third party environmental conservatory agency review this plan as selected by the EPA and provide a thorough impact statement from their results and how you can align to it. If no alignment can be reached, early exit the mine in a graceful way.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
I am extremely concerned about impact to water quality and the habitats that will be disrupted.

If you have concerns regarding the EARTH, please describe them below.

Everyone should have concerns for the earth. If the gravel pit is allowed to expand, the current tree canopy will not survive. Reducing summer peak temperatures and air pollution, enhancing property values, providing wildlife habitat, providing aesthetic benefits, and improving social ties among neighbors are just some of the benefits of improving a city's urban tree canopy.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Environmental exposure to dust from quarrying activities poses health dangers to the population living nearby. Dust generated through site preparation, various processing activities (drilling, blasting, crushing, screening and sorting and moving material should not be expanded and take place any closer to the trail that leads to Puget Sound.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If the creek is stopped/ allowed to dry up even for one month it will harm all that grows on the creek's banks and it will drive wild life that drinks there to leave the area and show up in neighbor's yards.

3 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

When will man learn that his actions do greater harm than good when it comes to construction of natural wetlands, streams and surface waters?

4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Obviously stopping the flow of water will kill any fish that may inhabit the creek and everyone knows water sustains all living plants and animals. Electric power companies in neighboring communities have had to tear out dams so our fish can survive and remain part of the natural food chain. Destroying the creek will cost money and the long term effects will be devastating for all. And down the road it will cost more money to correct the destruction in an attempt to return it to its natural state. What will become of the Nurse Tree?

5 EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

There are 10 points of interest on the trail. What will be come of them?

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

The Sequalitchew Trail is one of the prettiest trails in the area. It is a gently sloping, shaded, trail that goes all the way to Puget Sound.

6
EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

What does the Dupont Historical Museum think of these plans to enlarge the gravel pit? Don't they own the DuPont Wharf which is marked as historical on maps? Will the Historical Marker of the First 4th of July celebration west of the Mississippi also be destroyed? The “Buffalo Soldiers” encamped near Sequalitchew Creek. What do they say of these plans? They have a museum in Tacoma.

7

What is the name of the Agency or Organization?
South Sound Mushroom Club

If you have concerns regarding the EARTH, please describe them below.
There are several species of mushrooms that grow in the area you are looking at. I have seen some species there that I have never seen before. There are currently no state or federal protections for fungi. My grandchildren and I have been foraging edibles and making observations there for several years now. It is difficult to find such a large and wild parcel of land so close to human habitation. We are lucky to have it!

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.
It's not just the air quality for DuPont that is at stake here this Is so close to the shore that it will affect several nearby places in the South Sound.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
We all enjoy untainted water.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
Yes, these are fragile and disappearing habitats that deserve to be protected.

3 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
The lack of lane, negative impacts on water and air quality, and increased traffic will be bad for land, air, and water ecologies.

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.
Not a lot of cities have such a large, beautiful and wild park as DuPont does. There are a lot of track homes recently built there and the town is growing fast. Please be sure to leave plenty of recreation and wild areas in your town for the residents. It will make it a more desirable place to live.

4 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

You have each concern listed here. Looking at them all, how can you consider using the land this way?

5

If you have concerns regarding the EARTH, please describe them below.
I vote NO. Once that land and environment is destroyed, it cannot be recovered. Dupont needs a balance between business, residential and natural space. I don't want to own a house between warehouses and a gravel pit.

1 EA City

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
What is the impact on the aquifer? That cannot be repaired or replaced.

2 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
Where do the animals go?

3 EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

How many times do we have to say no? Dupont balances, natural area residential and industrial and cannot afford to lose any more natural area. The mining proposed would be irreversible and destructive to the environment.

If you have concerns regarding the EARTH, please describe them below.
When they run out of Steilacoom gravel, where will they go. Ext? The damage cannot be repaired. Rape the land then move on . . . ?

1 EA Cal

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
An aquifer is the root to all life above it. The plants and animals depend on it. Once destroyed, it can NEVER be repaired. The trees and ground vegetation can NEVER be replaced. The wildlife can NEVER be replaced.

2 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
Where do the animals go? Where do the birds nest?

3 EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.
Rape the land and there is no going back..

4 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.
Dupont has a tenuous balance of industrial, residential and natural. I don't want a home between warehouses and a gravel pit. STOP DEVELOPMENT

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Our glaciers are rapidly shrinking and we will not be able to depend on glacial run off for fresh water in the future. We need to preserve and protect ground water resources in Western Washington

1 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Our glaciers are rapidly shrinking and we will not be able to depend on glacial run off for fresh water in the future. We need to preserve and protect ground water resources in Western Washington.

2 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

There are so few natural spaces left, and it is these natural spaces that are the front line protectors against climate change. We need to continue to preserve and expand these precious places.

3 EA

If you have concerns regarding NOISE, please describe them below.

Noise pollution has actually been shown to decrease IQ points in developing children, and has a serious impact on psychological well being.

4 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

Sequalichew Creek was the home for indigenous people for thousands of years. This is a cultural site that absolutely must be protected and preserved for future people to learn about not only what existed but what was taken from the indigenous people that are still here. We should not continue a legacy of disrespecting indigenous land.

5 EA Cal

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

Sequalichew Creek is one of the most magical aspects of DuPont. It is a sacred natural space in a place that has largely been stripped of its natural beauty. It is a peaceful haven for many of us and provides psychological support. For me, this is like my Church. Sitting next to that creek is where I go when I am lost and hurting, and it's where I go when I am joyful and celebrating. I think of the people who found similar peace here for thousands of years. I think of the old churches and architecture that are so protected and know that this land deserves that same respect and more. Nature lost can't be brought back, and for the animals that depend on this space it needs to be preserved. Natural spaces are also essential for protecting our planet and physical health. Please do not allow greed that will only continue to consume and strip before moving on when it has taken everything it can to destroy this place.

6 EA DS

If you have concerns regarding the EARTH, please describe them below.

Lower lake levels or—in extreme cases—intermittent or totally dry perennial streams. These effects can harm aquatic and riparian plants and animals that depend on regular surface flows. Land subsidence and sinkhole formation in areas of heavy withdrawal. 1 EA

With the Future plans to expand the area aolng the nisqually sound there if going to ned to be use of other water sources, these sorces will be at risk of further contaminattion if the watertable is lowered and the mine expands.
Nitrate and orther ground chemicals can contaminate the soil more densely, It is a concern because if we lessen the amount of groundwater in the aquafer increased contamination of drinking water due to decreased ground water and compacted soil can affect our water, For example increased nitrates found in soil can reduce the ability of red blood cells to carry oxygen. This can cause serious health problems, especially for infants. 2 DS EA

If you have concerns regarding the AIR QUALITY, please describe them below.

According to a 2017 study by Hyndman and Wood, groundwater depletion in the United States could release 1.7 million metric tons of carbon dioxide into the atmosphere each year, which is more than the amount produced by the electricity used to power 250,000 households. 3 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Groundwater depletion can also lead to water quality deterioration. Increased pumping costs: As groundwater levels decline, it can become more expensive to pump water. 4 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Lower lake levels or—in extreme cases—intermittent or totally dry perennial streams. These effects can harm aquatic and riparian plants and animals that depend on regular surface flows. Land subsidence and sinkhole formation in areas of heavy withdrawal. 5 DS EA

Exposure to flooding: When an aquifer becomes compacted, it can lose its ability to absorb water, which can lead to surface flooding during heavy rains 6 DS

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

trickle effect Depleted water leas to less water sources for Animal and plants, dry out the aquafier and increased fire risks putting the ecosystem in place at danger. Wildlife will come into community areas more with noise and industrial and less food sources and water. 7 EA

If you have concerns regarding NOISE, please describe them below.

I am already upset with the future building plans for the Housing development there is already so much noise and light pollution with the industrial zones and the Military this will have an increase on the ecosystem and our community.

8 EA

If you have concerns regarding LAND USE, please describe them below.

I want this land to stay as natural as it can and not be demolished and depleted Like the Giving tree till there is no more! This is a treasure tht so many families enjoy it provides a respite area and solitude area for natural land and for the inhabitants both human and wildlife. Everyone that visits us we take on this hike or bike the lush forest to the sound.

9 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

I want this land to stay as natural as it can and not be demolished and depleted Like the Giving tree till there is no more! This is a treasure that so many families enjoy it provides a respite area and solitude area for natural land and for the inhabitants both human and wildlife. Everyone that visits us we take on this hike or bike the lush forest to the sound. Depleting it and allowing the mine to be closer will affect it, maybe not right away but eventually and puts the land at rsik for sink holes and fires as well.

10 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

The City of DuPont (Water System ID 20500) currently uses groundwater from five (5) wells for its public water supply. The City's water supply wells are located at Bell Hill (3) and Hoffman Hill (2), as shown on the map to the right. Bell Hill Wells 1 and 3 draw water from the Red Salmon Springs Aquifer; Bell Hill Well 2 draws water from the deeper undifferentiated Outwash/Lakewood Glacier Aquifer. Hoffman Hill Wells 1 and 2 draw water from the Red Salmon Springs Aquifer. Additional booster pumps were placed into service in 2003 to provide adequate pressure to customers on Hoffman Hill. All City wells access deep aquifers, making them less susceptible to contaminants. Brian Johnson, LG
Groundwater Quality Specialist

If you have concerns regarding the EARTH, please describe them below.

Surface mines create a huge amount of waste materials. Mines release harmful substances into the air and water, and can cause serious health issues if inhaled or consumed. Mines also release acidic water, which can kill marine life and make freshwater unsuitable for drinking. Underground mining produces fewer waste materials than surface mines, but they are risky for mine workers.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Gravel mining can emit airborne particulates, including PM-10 particles, which can be hazardous to respiratory health.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Blasting and quarry operations can change the turbidity levels in groundwater.

3 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Pits and quarries disrupt the existing movement of surface water and groundwater; they interrupt natural water recharge and can lead to reduced quantity and quality of drinking water for residents and wildlife near or downstream from a quarry site.

4 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Creating gravel pits or quarries requires removing vegetation, topsoil, and subsoil, which can lead to loss of habitat and biodiversity.

5 EA

If you have concerns regarding NOISE, please describe them below.

The hours of work at the gravel pit extend up to 12 hours a day, 6 days a week. On top of this, extended hours, could mean disturbed sleep for the community.

6 EA

If you have concerns regarding LAND USE, please describe them below.

Mining is an inherently invasive process that can cause damage to a landscape in an area much larger than the mining site itself. The effects of this damage can continue years after a mine has shut down, including the addition to greenhouse gasses, death of flora and fauna, and erosion of land and habitat.

7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

Gravel pits can disrupt natural landscapes by changing runoff patterns and surface water flow, which can cause problems for entire watersheds.

8 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

It will Increase road traffic on an already very limited network of roads

9 EA

If you have OTHER concerns not listed above, please describe them below.

Other potential environmental impacts of gravel mining include: noise, dust, blasting effects, erosion, and sedimentatio

10 EA

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

The dewatering of the Vashon Aquifer can heavily reduce groundwater for the natural area surrounding the city of DuPont

1 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

The Sequalitchew Creek will go dry for five months of the year if dewatering occurs. The Edmond Marsh in DuPont, a critical habitat, will also be heavily affected through the loss of water.

2 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

The dewatering of the Vashon Aquifer will reduce water flow to the Sequalitchew creek, significantly harming the riparian environment that surrounds it by halting water seeps. Specifically, it will hurt the growth of plants along the stream and destroy habitats for fish such as the rainbow trout, western brook lamprey, cutthroat trout, and sculpin. What's more, the loss of riparian functions can potentially cause wider harm to the local ecology by disrupting seasonal flow regimes of nutrients and matter from terrestrial environments to the Puget Sound.

3 DS EA

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If the dewatering of the Vashon Aquifer occurs, the Sequalitchew creek will be emptied for a significant portion of time, killing the flora along the Sequalitchew creek trail.

4 DS EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

If you have concerns regarding the EARTH, please describe them below.

I love Dupont I don't want a company to destroy the land and nice trails we have to adventure around in. I don't want this company to come to DuPont and mess it all up.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

I like fresh air. I don't want pollution that makes it bad to breath in the summer. I like how Dupont is green and has so much to do outdoors. Lots of nice trails and peaceful walks. I don't want a company to come in and ruin it here.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

I wish they would fix the water coming over the trails at Sequalitchew Trail. Even a boardwalk on some of the trails going down to the Puget sound. I don't want the Ground water / Aquifer be ruined if a company comes to DuPont. I want the water to be fresh and clean for the residents. I don't want to worry about our drinking water in DuPont.

3 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

I like the flow of the creeks. I want the national beauty let the salmons and fish go back up stream. Love the wetlands and we got take care of the beauty of it.

4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

Take care of our land and animals and fish and plants. It's so nice to see and explore the land. See all the wild animals and plants.

5 EA

If you have concerns regarding NOISE, please describe them below.

I love having a quite community. Never wanted Dupont to become loud and busy like the main towns. Keep Dupont quite and small. Love it here!

6 EA

If you have concerns regarding LAND USE, please describe them below.

I like to keep the land as it. Leave it be. I don't want a company to destroy what we have here.

7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

I don't like having ugly stuff that ruins everything. I like to just have the woods peaceful.

8 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

I just want everything to have clean fresh water leave everything as is.

9 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

I don't want heavy trucks roaming through the town ruining the roads loud noises. I don't want any of that.

10 EA

If you have OTHER concerns not listed above, please describe them below.

I do not want a company to mine and DuPont. I want to keep everything as is. I like the quietness and the fresh air we have in DuPont. I just want companies to leave Dupont alone. We already have enough commercial trucks in DuPont.

11 EA

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

RE: Pioneer Aggregates South Parcel Project – SEPA 2021-002

Dear Ms. Kincaid:

I am writing on behalf of Tucci & Sons Inc. in support of the Pioneer Aggregates South Parcel Project (SEPA 2021-002) and to comment on the recently released Draft Environmental Impact Statement (DEIS).

Tucci & Sons Inc is a civil construction company. We act as both a general contractor as well as a subcontractor performing earthwork, underground utilities, and asphalt paving. We work for private clients as well as all public agencies. We employ over 200 people and have 3 locations in Pierce County. Two of these locations are asphalt plants. At one of our asphalt plants, we deliver the aggregate material necessary for the production of our finished product via barge from Dupont. We receive 5-7 loads of material a month. Dupont Aggregates supply both of our asphalt plants with crushed products utilizing over 250,000 tons of crushed material annually. We also purchase washed materials, crushed products, and concrete for the various jobs we do. It is a vital source of material for our company and our region. It is critical to keeping cost down along with supplying high-quality materials.

1 EA

It is important that regulatory reviewers do not overlook the important economic contribution the Pioneer Aggregates facility makes to the regional economy and the businesses and livelihoods that depend on this resource.

Thank you for taking the time to review and consider these comments.

Sincerely,
Tucci & Sons, Inc.

Timothy F. Tucci

Re: Pioneer Aggregates South Parcel Project City File No. SEPA2021-002

Dear DuPont City Council Members:

I am writing to address my concerns regarding CalPortland's proposed dewatering of the Vashon aquifer for gravel mining purposes. As an EPA-certified watershed manager dedicated to the preservation of our natural resources, I urge the City of DuPont to take decisive action against this environmentally detrimental project.

The Vashon aquifer is an essential ecological and hydrological asset for our region. It plays a role in sustaining critical habitats and contributes to the community's and the military's primary source of drinking water. Dewatering this aquifer could result in far-reaching and irreversible damage to the local environment and community. 1 DS

The potential impacts of dewatering include, but are not limited to:

1. **Groundwater Depletion:** A significant reduction in the nearby aquifers' water levels, affecting upstream and downstream ecosystems, including the Edmond Marsh as well as Sequalitchew Creek riparian areas. Additionally, a reduction in water availability for residents and businesses at a time when environmental pressures indicate future water scarcity. 2 DS
2. **Land Subsidence:** Structural damage to buildings, roads, and infrastructure due to geological instability caused by the loss of aquifer support will cost the city and residents millions in damages. 3 EA Cal
3. **Saltwater Intrusion:** An increased risk of saltwater contamination in the aquifer due to significant decreases in the surrounding water table, rendering it unsuitable for human consumption or agricultural use. This is also true for surrounding aquifers, which the city depends on. 4 DS

4. **Air and Noise Pollution:** The use of heavy machinery and other mining techniques will generate substantial noise pollution and release particulate matter into the air, impacting both wildlife and the surrounding communities.
5. **Contaminant Pollution:** There is an increased risk of advection events caused by the creation of hydraulic gradients which have resulted from significant groundwater depletion. Advection events within this watershed are highly probable considering the activities of JBLM and the DuPont chemical company, potentially leading to the contamination of surrounding aquifers.
6. **Habitat Destruction:** Disruption of delicate wetlands and aquatic ecosystems, leading to the loss of biodiversity seen within the diverse ecosystems within DuPont's city limits.

The long-term consequences of these impacts would be devastating for the City of DuPont, JBLM, and the communities within. The economic, environmental, and public health implications are substantial and must not be overlooked.
I urge the City of DuPont to prioritize the protection of the Vashon aquifer by:

1. Denying CalPortland's dewatering permit application.
2. Implementing comprehensive groundwater management plans to safeguard the aquifer for future generations.
3. Exploring alternative, sustainable mining methods that do not rely on aquifer depletion.

By taking a leadership role in protecting this invaluable resource, the City of DuPont can demonstrate its commitment to environmental stewardship and the well-being of its community. Thank you for your attention to this critical matter. I am available to discuss this issue further and provide any additional support as needed.

Sincerely,

Taylor Underwood
EPA Certified Watershed Manager

If you have concerns regarding the EARTH, please describe them below.

I am concerned about the impact that stirring up dirt related to the smelter plume will have unintended impact on thoss living close to the area as well as local wildlife. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

I don't like the idea of stirring up dust in the area of the smelter plume cloud. 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

I am concerned about the drawdown of the aquifer and the resulting damage to sequalichew creek. This area is habitat to native wildlife as well as native plants. In addition, in our current changing climate, water resources are more important than ever. The sequalichew trail also brings in people from outside dupont. Damaging the area, even through indirect action would make this a less desireable hiking location. 3 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

The wetlands provide habitat for other species of plants and animals and reduce fire risk by holding water in the environment rather than letting it run off and dry out. 4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

The destruction of habitat in general and landmark trees, particularly endangered trees like the Pacific Yew should not be considered lightly. 5 EA

If you have concerns regarding NOISE, please describe them below.

This area is encroaching on housing areas and the increase in noise will not be welcome. 6 EA

If you have concerns regarding LAND USE, please describe them below.

Currently, this area is a nice wooded place to hike and maintains a buffer to the sequalichew creek trail. Even with an easement, an open hole devoid of trees is not a pleasant place to be. 7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

The green wooded space is far more appealing than an open hole.

8 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

This entire endeavor sounds terrible from the start. The impacts on local wildlife, habitat, and ecosystems laid out in the attached statements are fairly damning already. I can't believe this catastrophicly destructive proposal made it this far. Part of why I live here is the natural beauty that is easily accessible by the trails. I'm not sure why the city of Dupont would be so keen to destroy one of their best assets for a temporary influx of funds.

9 EA

If you have concerns regarding the EARTH, please describe them below.

The land will dry out due to lack of water during the hottest time of the year. With the threat of fires increasing every year having draining our source of water is disastrous, not to mention the environmental impact that will have on our already sensitive ecosystem.

1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.

Without the greenery to filter out the heat and purify the air (due to lack of water during the hottest times of the year) what will we have as a barrier?

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

The whole ecosystem will collapse. The forest area will die back, all the animals will be displaced.

3 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

What will happen to all the wildlife that will be displaced for this project? Part of the beauty of living in DuPont is being surrounded by the beautiful green forest and living so close to wildlife. All that will be gone because the "new ecosystem" that will be created won't be able to sustain their needs.

4 EA Cal

If you have concerns regarding NOISE, please describe them below.

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

If you have OTHER concerns not listed above, please describe them below.

I would like to know how destroying an already sensitive ecosystem, for profit, is helping with climate change?

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

The aquifer's limited water allowance will increase the risk of fire and floods. This will negatively affect wildlife and the ecosystem.

1
EA

Animals will also be impacted as their water source and vegetation will dry up.

The noise of construction and mining operations will cause increased noise in the area, especially when North Fort Lake will be developed.

DuPont, WA 98327

RE: Pioneer Aggregates South Parcel Project – SEPA 2021-002

Dear Ms. Kincaid:

I am writing on behalf of T. E. Walrath Trucking, Inc. in support of the Pioneer Aggregates South Parcel Project (SEPA 2021-002) and to comment on the recently released Draft Environmental Impact Statement (DEIS).

- We are a family operated trucking co. and landscape supplier with 125 employees
- We have landscape supply yards in Gig Harbor, Olympia and 2 in Tacoma
- We also have a marine division that specializes in offloading barges for local projects
- Our trucks are in the Dupont pit multiple times every day.

1 EA

We utilize many of the aggregates produced at the Dupont pit. They end up in projects and private homes all over our region. The cost of transportation is so high, having material sources close to the end users is vital. The economic burden is already pressing in on folks.

It is important that regulatory reviewers do not overlook the important economic contribution the Pioneer Aggregates facility makes to the regional economy and the businesses and livelihoods that depend on this resource.

Thank you for taking the time to review and consider these comments.

Sincerely,

Tom Walrath, Jr.
T. E. Walrath Trucking, Inc.

PS Please include this additional cite for heat changes: Axios Seattle, Our heat waves are getting longer in Seattle and across Western Washington, Christine Clarridge, July 09, 2024.
Thanks

On Mon, Jul 8, 2024 at 5:56 PM Kate Walsh <3mcwals@gmail.com> wrote:

Dear Barbara,

Here is my comment opposing CalPortland's request to expand the mining operation in its South Parcel:

I oppose permitting CalPortland to expand mining operations in its South Parcel because of the destructive environmental impact that its proposed expansion will have on Sequalitchew Creek, the Sequalitchew Creek Trail, and the Trail slopes; the Edmond Marsh; four other wetlands in DuPont.

The **2015 DuPont Comprehensive Plan** (**DMC**) and the Critical Area Ordinance Chapter 25.105 both contain language that supports denying a permit expanding mining into the South Parcel. *See* **DMC 25.105.010** (stating the primary purposes of the chapter are to protect public helath safety and welfare by preventing adverse environmental impacts of development, endorsing a policy of no net loss of wetland and stream function, value, or area within DuPont, barring to the extent practicable adverse cumulative impacts to water quality, wetlands, stream corridors, and fish and wildlife habitats, using the best available science). And **DMC 25.105.010** expressly protects the public from injury, loss of life, property damage, or financial loss due to flooding, erosion, landslides, seismic events, soil subsidence or steep slope failures. 1 EA City

The **DMC** recognizes the value of mineral resource extraction, but it also requires that mining entities protect the natural enviroment's integrity and employ best management practices that protect the long-term integrity of the natural environment, water resources, adjacent land uses, and the long-term productivity of the resource lands. **Resource Land Goal LU-10, LU 10.3.** And **Natural Environment Goal NE-1** supports protecting DuPont's natural environment by meeting citizen's current needs without compromising the needs of future generations. The NE Goals serve to preserve environmentally sensitive areas and areas that constitute valuable natural and aesthetic resources. **NE 1.1, 1.2.** These goals support development and construction practices that minimize impacts on the environment, not that ignore or override developmental impacts on the environment.

CalPortland's DEIS violates the protective purposes of the DMC and the NE Goals in seeking to dewater the Vashon Aquifer and expand its gravel mining operation. CalPortland clearly acknowledges that in dewatering the aquifer, it will dry up the Sequalitchew Creek Ravine for extended months of the

year, thereby drying out the creek ravine's seeps and springs. That in turn will destroy the riparian vegetation and unique environment and recreational use of the Sequalitchew Creek trail, which DuPont residents and local visitors treasure and that positively influence the valuation and desireability of DuPont residential properties. 1 cont

CalPortland acknowledges but discounts the fact that dewatering the aquifer, drying out the creek, and reducing the seeps will increase the level of landslide hazard susceptibility within the Sequalitchew creek ravine. Ground water dynamics relating to dewatering a slope in a riparian corridor show that such dewatering definitely can lead to instability and landslides. CalPortland ignores or downplays the risk its proposed expansion will cause: riparian vegetative stress, soil erosion, soil compaction, increased ground water temperature, loss of animal and insect presence and diversity, loss of trees that provide shade, habitat for wildlife, and air purification. And of course, increased landslide hazard will drive out humans who live here or visit DuPont and seek the pleasure of walking the creek. It offers no meaningful mitigation plan to addrss the consequnces of its proposal. 2 EA Cal

Also as Washington faces hotter than usual summers, with lower precipitation, *see* University of Washington Climate Impacts Group, https://climate.washington.edu/climate-data/trendanalysisapp/, dewatering the Sequlitchew Creek ravine will create fire hazard in DuPont's growing community. And increased fire hazard will means increased fire-protection costs and tax burden on citizens. CalPortland does not address or offer to mitigate the potential fire hazards and costs of its dewatering proposal. 3 DS EA

Relatedly, CalPortland's plan to increase mining in its South parcel will significantly, adversely affect the wetlands, marshes and creeks, including that:
The West Edmonds marsh groundwater level will decrease by 9 feet, the Pond Lake water level will drop 2 feet, Wetlands numbers 8, 9, and 10 will be reduced by a foot, Old Fort Lake will drop .05 feet, The Kettle Wetland will evaporate, and the Sequalitchw Creek seeps and springs will dry up. And these groundwater reductions will be permanant, thus permanently causing loss of vegetation, stream flow, habitat, and ability to remove air pollutants. 4 DS EA

Other persons doubtless may respond to other issues, like the adverse effect of CalPortland's mining on the City of DuPont's water rights to the Vashon Aquifer. In closing, I'll only ask the City to reject CalPortland's mining plan that will destroy not just Sequalitchew Creek, but also multiple, essential elements of the quality of life upon which DuPont has prided itself: the green space, the family-friendly "your home town" atmosphere, the safe streets and focus on outdoor walking opportunities. CalPortland's plan will ride rough-shod over and destroy the very values that have promoted DuPont's growth and desirabilty in the last decades and will damage the value of residential owner's properties, by destroying a unique, close-to-home outdoor, recreational amenity. 5 EA

I oppose the permitting of the mining expansion of CalPortland's South Parcel and favor a "No Action" recommendation on its proposal.Thank you for this opportunity to comment.

Sincerely
Kate Walsh
2180 Palisade Boulevard
DuPont WA 98327

RECEIVED
JUL 17 2024
CITY OF DUPONT

Letter 231

Dear Ms. Kincaid,

Thank you for expanding the comment period. This comment specifically addresses how expanding gravel mining will destroy the value of homes in DuPont, destroying our community and most residents' primary investments. I submit it because the question was raised about whether there was evidence that expanding gravel mining operations as CalPortland wants affects residential property value.

Studies repeatedly have found that mining, including operating gravel mines and gravel pits, adjacent to homes significantly damage housing values. Professor Dianne Hite, professor of Economics at Auburn University, authored the much referred to study **The Impact of Operational Gravel Pits on House Values, Prof. Dianne Hite, Auburn University (2006); The effect of a sand/aggregate mine on property value, Valaria Simpson, Plumas News, July 15, (2024)** that affirmatively answers that question. Hite found a definite statistical correlation between property sale prices and the proximity of homes to gravel pits and open pit gravel minds. She found that homes adjacent to a gravel pit/mine lost about 30% of their market value, homes a mile from a pit or mine site lost 14.5% of their value, homes two miles from a pit or mine lost 8.9% of its market value, and homes that were three miles or more from a gravel pit or mine lost 4.9% of their value. This is understandable: operators of gravel pits, quarries, and mines remove vegetation, topsoil, and subsoil, damaging preexisting stream flows, in order to access the gravel resource they seek. ***Home Values Plummet from Quarries, Kill the Albion Quarry, citing Pemrial Institute (2005).***

The mining/open pit operations destroy home values by imposing : (1) Aquifer depletion and loss of wells or potable water source; (2) Contamination of drinking water, (3) Noise pollution from increased traffic, blasting, and other mining operations that adversely affect residents' health, (4) Degradation of air quality that damages citizen health, especially young and the elderly; (5) Light pollution that destroys residential atmosphere, (6) Vibrating heavy equipment and trucks and blasting, that aggravates earthquake fault lines, causes cracks in buildings, and promotes excess erosion, (7) Increased fire risk from causes including the storage of diesel fuel, petroleum hydraulic liquids, and other transmission fluids at open pits or mines, and (8) Destruction of community safety. ***Id.***; **US Study on the impact of pits and quarries on home prices, GravelWatch. org.wp-contract.**

1
EA
City

Even where, as here, a mining company may promise restoration of mining a decade down the road, after the extraction concludes and profits are collected by the company, municipalities must beware of the dangers of past mining history on residential values in its communities. **Beware the Dangers of Past Mining, Tom Backhouse, Mortgage Finance Gazette (August 2018)**. Past mining activity creates a risk of collapse of later-built housing developments, due to the historical mining. The hazard of collapse of a later built development, due to historical mining, is especially present when the mining activity was on or under a house or development and historical mining can reduce the value of property by 30%. **Id.**

From a residential real estate position, location is the paramount factor valuing residential property. Living close to certain businesses or facilities, including mining, can negatively affect overall property value. Value decreases near a dump, landfill, power plant or mine, or similar operation because of a business's increased traffic, industrial noise, and the light, air or water pollution. **Things that can hurt your property value, Jennifer Schmidt and Richard Haddaad, Homelight, February 25, 2023).** The effects of mining particularly include increased industrial traffic, noise, traffic pollution. But mining also brings explosive blasting, dust, serious threats to water courses and ecosystems, and air blasts, which are felt and heard by residents adjoining the mines or pits, and farther away. The vibrations from blasting and the mining process also cause cracks and structural and cosmetic damage to homes. ***Effects***

***of mine blasting on residential structures, Research Gate,* E. Fgad, J.L.Wilson (August 1, 2005); Home values plummet from Quarries**. Hite concluded that because loss of property value is greater the closer a home is to a gravel mine, gravel mines should be located far from existing residences, to minimize the negative financial cost and adverse health and safety consequences to homeowners of gravel mining activity. 1 cont

That continues to be true and for all the reasons discussed above the city should reject Cal Portland's plan to expand its mining operation at the cost of homeowners and the safety and health of DuPont citizens. CalPortland's plan will benefit CalPortland but will devalue DuPont homes and damage DuPont citizens' investments in their homes and community. CalPortland's legal obligation is to derive the greatest profit at the least cost from its mining operations for the financial benefit of its shareholders. It states that it is headquartered in Glendora California. Consistent with its capitalist and corporate duty it cares not about the destruction to DuPont's water and ecosystems that effectuating its proposal will cause to resources like Sequalitchew Creek or the foliage and streams surrounding it, or the future risk that historical mining will impose. Any proposal it puts forward or promises it makes about restoration and the effect of historical mining should be reviewed by an independent expert, so that a decision about the CalPortland plan is based on actual effects of the plan on Sesqualitchew Creek, the water tables and ecosystems here, and the value of homes in DuPont. 2 EA

For this reason too, I oppose the plan CalPortland puts forth. Thanks for extending the deadline and offering a further comment.

Sincerely,

Kate Walsh

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.
I have asthma, the dust particles from this project and the fumes from machinery will make it hard to breathe for people with breathing issues. 1 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
The drinking water is already subpar, this will make it unusable. 2 DS

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
Why would you want to displace our wildlife? Didn't that happen with the industrial park? Now that things have finally settled down from that, why make it worse? 3 EA

If you have concerns regarding NOISE, please describe them below.
This has the potential to be very noisy,given we live less than .25 miles from the proposed area. 4 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.
We opted to retire in Dupont for the beauty of this community. We love having trails. Stop trying to take that away. 5 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

We have enough issues with large trucks barreling through, this will only make things worse.

6
EA

If you have OTHER concerns not listed above, please describe them below.

We arein near drought conditions. This has a potential to cause wildfires, which will certainly add to air quality issues. Not to mention the potential to displace people from their homes. I also see people moving away, this will take the serenity out of this town.

If you have concerns regarding the EARTH, please describe them below.

If you have concerns regarding the AIR QUALITY, please describe them below.

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

Do not allow the local gravel quarry to expand and dewater the aquifer. This will have a negative impact on the community and the local vegetation and wildlife.

Concerned about all of these areas. We are so careful about everything else that is proposed for our community, but not about the noise, mess, traffic, environmental change and disruption this will create?

If you have concerns regarding the EARTH, please describe them below.

Protecting our earths aquifers is so very important. When we know ahead of authorizing mining that an aquifer will be dewatered, we must, as responsible citizens consider the impact and thoroughly understand where this will impact the surrounding land and the the far reaching implications for this communities future.

1 DS EA

If you have concerns regarding the AIR QUALITY, please describe them below.

When trees, plants and grass die from no longer having the water supply, science tells us this affects our air. Please ensure a contingency plan is in place before dewatering the aquifer for gravel mining.

2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.

The proposal, on pg. 3.1-14, clearly states this effect will dewater the Vashon Aquifer and I feel the only responsible thing is to require a plan for how to avoid taking such an important natural resource away from this earth that will never come back before allowing any gravel mining.

3 DS EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.

Surface water feeds the aquifer, our streams and wetlands depend on the aquifer. What is the plan to ensure these resources stay healthy and are not affected?

4 DS EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.

We must consider the organisms we cannot see as well as the animals we can see when deciding to dewater an aquifer. As a rain forest type climate in our community where is the study that will show the damage and long range impact of eliminating a water source for organisms living in our environment?

5 EA

If you have concerns regarding NOISE, please describe them below.

Noise should be considered for the quality of life of the residents who live near where the mining will be implemented. There should be no noise increase for any resident of our community.

6 EA

If you have concerns regarding LAND USE, please describe them below.

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

It is important to maintain and even contribute to the over arching aesthetic of our community. One of trails and natural beauty where families and individuals can have a healthy area to thrive when outside right within steps of their residences.

7 EA

If you have concerns regarding TRANSPORTATION, please describe them below.

No more large trucks going in and out of this community! Hear the residents when we say, we want alternatives to trucking in our community!

8 EA

If you have OTHER concerns not listed above, please describe them below.

Our community needs resources like medical and emergency services. High end homes that contribute tax dollars are preferred to selling off the land for mining in my opinion.
Overall we must educate ourselves about aquifer=gets in our earth and how they support the unique environment we are living in before we destroy them!

9 EA

If you have documents or images that support your comments and / or concerns, please combine them and upload the combined document below. Only one document may be uploaded.

RE: CalPortland South Parcel DEIS Comments

I am extremely concerned about the proposed CalPortland South Parcel mine expansion, it's impact on the ground water level due to cutting through the Vashon Aquifer, the impact this would have on the surrounding vegetation, and the resulting potential increase of fire danger for our residents, our homes and our businesses. Therefore, I do not recommend approving the expansion of the mine unless there are mitigations that ensure that the groundwater level will not be lowered. One such mitigation would be to limit the mine expansion to areas above the aquifer.

1
EA
DS

Of specific concern is the projected drop in the groundwater level of up to nine feet in Edmonds Marsh. Other areas of concern include the drop in ground water level in Pond Lake; wetlands 8, 9, and 10; and Old Fork Lake. In addition, another concern is the elimination of the Kettle Wetland and that the seeps and springs feeding Sequalitchew Creek will likely dry up. This drop in groundwater level will likely dry out the vegetation surrounding the City of DuPont.

2
DS

It is important to note climate conditions have worsened since the 2011 Settlement Agreement was prepared. The City of DuPont is surrounded by forest and climate change is already increasing the risk of fire to our residents. The resulting decrease in the ground water level from the mine expansion will likely put the residents of DuPont at even a greater risk of fire danger.

3
DS
Cal
City

While restoring Sequalitchew Creek is a goal we should all be working toward, I do not believe it should be dependent upon dewatering the Vashon Aquifer. As outlined above, the decrease in the groundwater level throughout the area will likely have a huge negative environmental impact on the vegetation and the wildlife in the area. We would simply be changing one environmental problem for another. This new environmental problem likely increases the risk of fire for the residents of DuPont.

4
EA

Thank you for your consideration and work on this very important matter.

Sincerely,

Michael Winkler

RE: CalPortland South Parcel DEIS Comments

I wish to take a moment to share concerns about the proposed CalPortland South Parcel mine expansion and the need for mitigations that ensure that the expansion doesn't increase the fire danger to the vegetation and to our residences. Unless the mitigations can ensure that the surrounding groundwater table isn't reduced, I recommend that mining be limited to the area above the Vashon Aquifer.

1 DS Cal EA

Climate change has become an increasing problem for all of us, with a special note of the increased fires on the west coast, to include western Washington. The City of DuPont is surrounded by forest and the projected decrease in the ground water level from the mine expansion will likely make these forests more susceptible to fire. This, in turn, would put the residents of DuPont at a higher risk of fire danger.

2 DS Cal City

A review of the documents shows that the projected drop in the groundwater level in Edmonds Marsh is up to nine feet. There is also a projected drop in ground water levels in Pond Lake; wetlands 8, 9, and 10; and Old Fork Lake. Also, the Kettle Wetland would be eliminated and Sequalitchew Creek will likely dry up. Again, the impact on vegetation and the potential increase in fire danger is very concerning.

3 DS EA

Thank you for reviewing my concerns and for ensuring the safety of our residences and the protection of our surrounding environment.

Sincerely,

Nanette Winkler

If you have concerns regarding the EARTH, please describe them below.
As a 21 year resident.. I am very upset with this news.

With all the work that has been down over the years to correct the damage that DuPont Chemical did, I cannot understand how this could even be a considered. 1 EA

If you have concerns regarding the AIR QUALITY, please describe them below.
Lots concerns about the air quality. 2 EA

If you have concerns regarding the GROUNDWATER / AQUIFER, please describe them below.
Very concerned, we also ready have water issue of contamination. 3 EA

If you have concerns regarding SURFACE WATER / STREAMS / WETLANDS, please describe them below.
I have huge concerns about our surface water, streams and wetlands. 4 EA

If you have concerns regarding FISH / PLANTS / ANIMALS, please describe them below.
This is not good for fish, plants or animals. Please don't let this happen to our little town! 5 EA

If you have concerns regarding NOISE, please describe them below.
We have to deal with noise from JBLM but this would be a daily noise and it will be awful! No one will want to live here! 6 EA

If you have concerns regarding LAND USE, please describe them below.
They will lie and it will be a terrible choice for our town! 7 EA

If you have concerns regarding AESTHETICS / VISUAL, please describe them below.

They will ruin our beautiful trails!

8 EA

If you have concerns regarding CULTURAL RESOURCES, please describe them below.

If you have concerns regarding TRANSPORTATION, please describe them below.

We have so many issues already with all the trucks in town who don't follow the rules and drive through our little town and many times running of plants and grass to turn around.

9 EA

If you have OTHER concerns not listed above, please describe them below.

It's seems that all many city official's care about it money for the corporation in town who don't live here. They don't care about our town!

10 EA
